ADRENALIN®

Circulatory stimulant, vasoconstrictor, resuscitant, and hemostatic, this pure crystalline hormone is one of the truly basic drugs — an invaluable aid in office, in hospital, and in clinic. It is an important adjunct in local anesthesia, valuable in arresting superficial hemorrhage, and a standby for decongestion of engorged mucous membranes.

ADRENALIN is available as ADRENALIN CHLORIDE SOLUTION 1:1000, ADRENALIN CHLORIDE SOLUTION 1:100, ADRENALIN IN OIL 1:500 and in a variety of forms to meet all medical and surgical requirements.

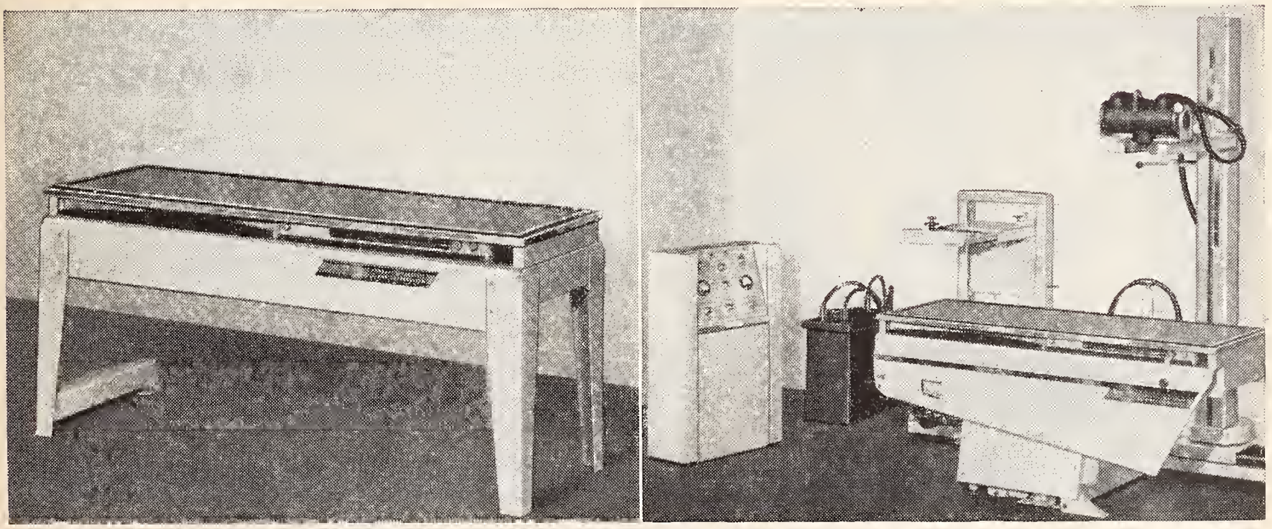
GE MAXICON meets the medical profession's long-felt need for x-ray equipment developed to grow with an expanding practice, providing just the x-ray facility required . . . unit by unit as needed!



From this . . . to this . . . in a few easy steps!

Bucky table to motor-driven combination unit! Comprised of a number of components that can be assembled in various combinations — the Maxicon series have a wealth of utility wherever diagnostic x-ray is employed. The Maxicon covers the range of diagnostic x-ray apparatus from the horizontal x-ray table to the 200-ma, two-tube, motor-driven combination unit.

Check the remarkable flexibility of the Maxicon. Discover what it can do for you. Ask your GE representative or write

POSITIVE CLINICAL FINDINGS IN CERTAIN

In Amebiasis (E. histolytica)

"In daily doses of 1.0 and 2.0 grams by mouth for ten days, terramycin therapy resulted in the disappearance of E. histolytica from the stools of all but one of 22 patients. Parasitic relapse occurred in this individual on the eleventh day after treatment, whereas in the remaining 21 subjects, the stools have remained negative to date."

Most, H., and Van Assendelft, F.: Ann. New York Acad. Sc. 53:427 (Sept. 15) 1950.

CRYSTALLINE

Terra

Clinical findings covering a wide range of bacterial and rickettsial as well as several protozoan infections indicate that:

1. *Terramycin may be highly effective even when other antibiotics fail.*
2. *Terramycin may be well tolerated even when other antibiotics are not.*

INFECTIONS OF THE GASTROINTESTINAL TRACT

In Dysentery
due to Shigella paradysenteriae

Six cases, Terramycin treated—

"The diarrhea, which was pronounced in each case, stopped within 48 hours in the case of four patients and within 72 hours in the other two. . . . In all cases, the organism disappeared from the stool after treatment was started and did not reappear."

Dowling, H. F.; Lepper, M. H.; Caldwell, E. R., and Spies, H. W.: Ann. New York Acad. Sc. *63*:433 (Sept. 15) 1950.

High Vitamin B_{12} Content… Another Reason for Liberal Meat Intake

According to rapidly accumulating clinical and laboratory observations, the daily ingestion of liberal quantities of meat can effect profound physiologic benefits due to the significant content of vitamin B_{12}, not only in liver and kidney, but also in muscle meats.

Muscle meat is a good source of the newly isolated vitamin B_{12}; liver and kidney are especially high in their vitamin B_{12} content, while plant foods are negligible sources of this nutrient.[1] By rat assay, the minimum amounts of vitamin B_{12} in muscle meat range from 0.5 to 3 mcg. per 100 Gm.; minimum values for beef liver and kidney are 15 and 20 mcg., respectively.[2]

B_{12} is among the most potent of known microbiologically active substances.[3] Animal studies indicate that it increases the ability of the normal mammal to utilize protein.[4] With a high protein diet, 0.01 mcg. of vitamin B_{12} per day was found to increase significantly the growth rate of B_{12} deficient rats. In another study, growth response of B_{12} depleted rats was proportional to the B_{12} in the ration within the critical range of 0.025 to 0.1 mcg. per rat day.[5]

About 1 mcg. of vitamin B_{12} daily, administered intramuscularly, constitutes an effective dose in pernicious anemia. In a recent clinical study of young children manifesting vitamin B_{12} deficiency as evidenced by malnutrition and growth failure, oral administration of 10 mcg. of vitamin B_{12} daily for eight weeks induced marked responses in growth; notable increases in vigor, alertness and better general behavior; and improved appetite.[6]

Here again is further evidence of the broad, over-all nutrient contribution meat makes to the dietary. Eaten two or three times daily, it supplies not only generous amounts of high quality protein, but also significant quantities of vitamin B_{12} and other essential B complex vitamins, and of iron.

American Meat Institute

Main Office, Chicago…Members Throughout the United States

when "eating for two"

... plenty of citrus fruits

Most obstetricians today insist that their mothers ingest plenty of vitamin C, particularly after the first trimester[1] (8 oz. citrus juice during pregnancy, 12 oz. while lactating).[6] Pregnancy is thus made safer because toxemia is thereby reduced.[7] Also, more babies are born normally and with a higher birth weight, while premature and still births are fewer.[3,4] In addition, both maternal and infant health is improved postpartum when an adequate vitamin C regimen has been followed throughout pregnancy.[2] Most mothers enjoy the flavor of fresh Florida citrus fruits (so rich in vitamin C and containing other nutrients*), as well as the energy pick-up provided by their easily assimilable fruit sugars.[5]

Citrus fruits—among the richest known sources of vitamin C—also contain vitamins A and B, readily assimilable natural fruit sugars, and other factors, such as iron, calcium, citrates and citric acid.

When little patients get high handed

It isn't necessary any more to fight down a bitter tasting medicine like penicillin. Simply prescribe *Dulcet* Penicillin Tablets—the little cubes that look, smell and taste like candy. Children think they are candy. But the penicillin is there—50,000 or 100,000 units of it, depending on which of the two available strengths you prefer—buffered with 0.25 Gm. of calcium carbonate. *Dulcet* Tablets are stable and have the same antibiotic power as equal unitage of penicillin in unflavored preparations. For your next little patient—or finicky big one—try this tantrum-quelling, pleasant method of administering oral penicillin. Pharmacies everywhere have *Dulcet* Penicillin Tablets in bottles of 12 and 100.

If You Are Called Into Service—
If You Are Too Old to Be Called Into Service—

In either event the rebellion in Korea affects your pocketbook in a major way, which will be reflected in your accounts receivable.

Soldiers Relief from their financial obligations has again been invoked making it impossible to enforce collection against anyone in the Armed Forces.

With our many years of valuable experience in handling the accounts for over 1,000 professional men, there is now an influx of professional accounts to this office due from patients about to enter Military Service where the possibility of immediate collection appears very problematical.

Our Recommendations

Based upon our experience in liquidation of accounts prior to, during, and after World War II

(1) Concentrate effort on the collection of accounts against patients who may be called in the Armed Forces.

(2) THE TIME TO COLLECT IS NOW because with inevitable continued inflation, increased salaries and wages, farm prices, commodity prices, there will be more money in circulation.

(3) That if you already have been called into the service or anticipate being called that you permit this qualified organization to act as your liquidating agent.

Our many years of experience handling accounts in the professional field plus our contractual relationship with fifty trade associations extending from coast to coast, proves we are rendering outstanding service.

Professional, commercial trade associations, and bank recommendations furnished.

point of departure

for special

feeding cases...

Dryco is not only the point of departure for almost every type of infant formula—it is also in itself a valuable food for special cases. Dryco assures ample protein intake while its low fat ratio and moderate carbohydrate content minimize digestive disturbances.

The applicability of the Dryco formula is strikingly seen in an observation by Pitt: "The majority of cases of infant diarrhea, seen in private practice, are of such nature that changing the formula to one of low fat and low carbohydrate is all that is necessary to correct the condition..." Dryco is specifically recommended for use in these cases.*

In addition to formula flexibility, Dryco offers other advantages.

Dryco's special drying process makes it more easily digested by certain infants than the fresh milk from which it is made. It supplies more minerals, particularly more calcium, than a corresponding formula of whole milk, plus 2500 U.S.P. units of vitamin A and 400 U.S.P. units of vitamin D per reconstituted quart. Only vitamin C need be added. Each tablespoonful supplies 31½ calories. Readily reconstituted in cold or warm water.

Available at pharmacies in 1 and 2½ lb. cans.

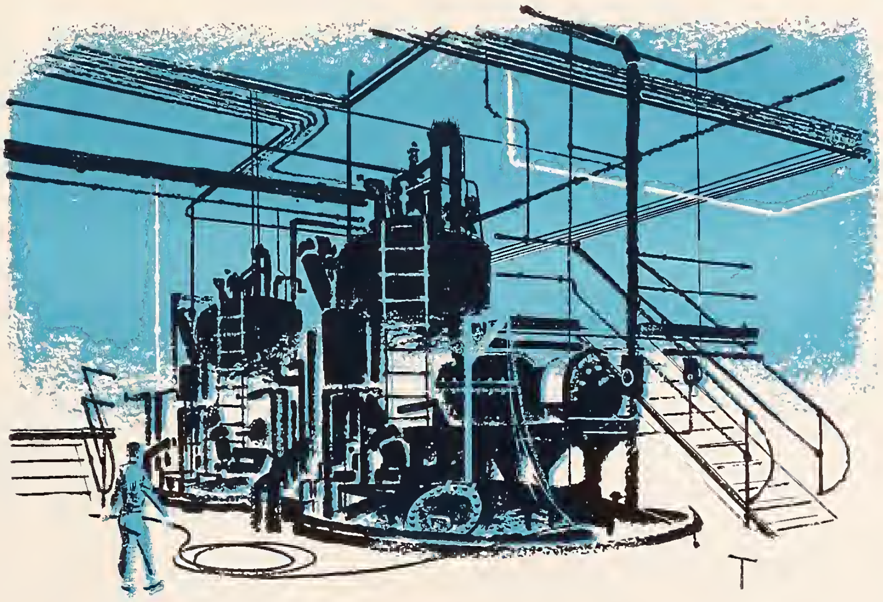
AUREOMYCIN

Lederle

Effective against many bacterial and rickettsial infections, as well as certain protozoal and large viral diseases.



The isolation of crystalline aureomycin from the fermentation mash is an intricate task. It must be done in such a way that inactivation or loss of the antibiotic is minimized. In addition, the removal of impurities must be so complete that the finished product will cause a minimum of undesirable side-reactions. For this purpose, highly specialized technical equipment is employed, in order to effect liquid-solid and liquid-liquid extractions. Vacuum concentration and crystallization are carried out in glass-lined tanks, to avoid heavy metal contamination. The temperature and degree of vacuum are automatically controlled by means of precision instruments and the purification of the product is carefully followed by laboratory tests.

Aureomycin is now available in a number of convenient forms, for use by mouth and in the eye. New forms of this antibiotic of unsurpassed versatility are constantly being brought out.

Capsules: *Bottles of 25 and 100, 50 mg. each capsule. Bottles of 16 and 100, 250 mg. each capsule.*
Ophthalmic: *Vials of 25 mg. with dropper; solution prepared by adding 5 cc. of distilled water.*

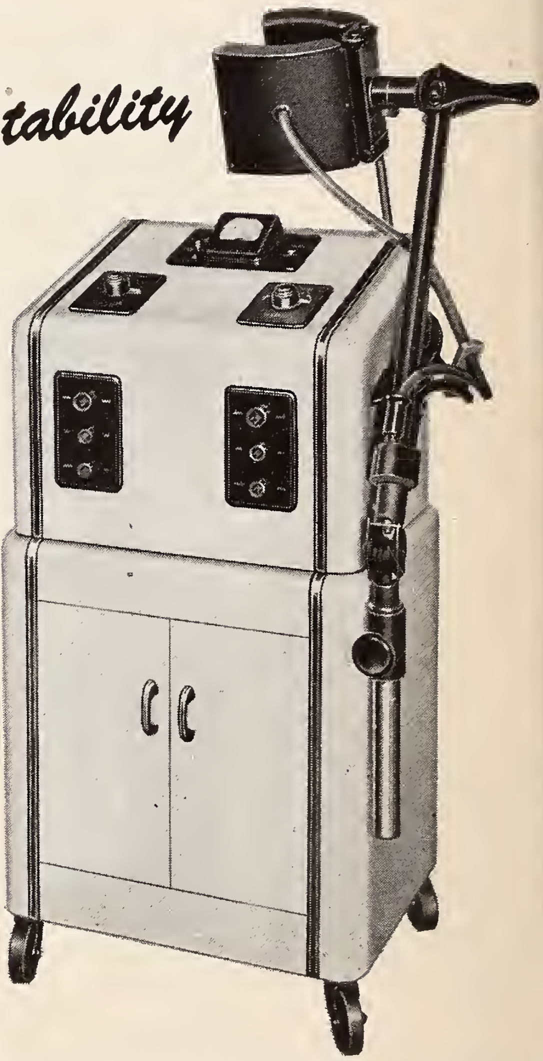
LEDERLE LABORATORIES DIVISION AMERICAN Cyanamid COMPANY 30 Rockefeller Plaza, New York 20, N.Y.

No Diathermy like it

Only the L-F SW-227 gives you BOTH

Every Short Wave Application

Absolute Frequency Stability



OPERATES ON F.C.C. ALLOCATED FREQUENCY

The exclusive L-F WAVEMASTER frequency control maintains operation at the frequency allocated by the Federal Communications Commission.

EVERY KNOWN METHOD OF APPLICATION IS AVAILABLE WITH THE L-F SW-227

Hinged Treatment Drum
Air Spaced Plates
Condenser Pads
Inductance Cable
Orificial Electrodes

The Hinged Treatment Drum alone is adjustable to fit the contour of any part of the body to be treated. PLUS —Protect-A-Tube safeguard . . . single-tube design, for remarkable economy . . . Voltage Compensator . . . Metering Device . . . Adjustable, Counterbalanced Arm . . . and other features.

NEW SOLUTIONS

JOHN S. LUNDY, M.D.
Rochester, Minnesota

THE MATERIALS which I wish to discuss comprise a category for which I do not know the name. They might be called "oncotic fluids" or "replacement fluids," but they should not be called "plasma or blood substitutes," and they never should be allowed to fall into the same category as solutions of crystalloid material such as salt and dextrose. These new materials are in sharp contrast to blood and plasma and to solutions of dextrose and salt. Crystalloid solutions, as well as blood and plasma, circulate not only lengthwise in the vessels but also laterally through the walls of the capillaries into and out of the tissues. In contrast these new solutions tend to remain in the circulation and to travel the length of the vessels with probably little lateral motion or passage through the walls. I have found them to be particularly valuable in treatment of shock, especially surgical shock.

The new solutions are dextran, gelatin, periston, acacia, pectin and isinglass, of which I will discuss only the first three.[2]

Dextran was first reported in 1944 by Grönwall and Ingelman[1] of Sweden. I have used the Swedish brand of dextran (macrodex) clinically for more than 1,500 patients since April, 1946. Dextran has been marketed in England under the name of "intradex."[3]

The molecular weight of dextran is rather large, varying from 5,000 to 350,000. Under the electron microscope the molecules appear as branched chains or even resemble the twig of a tree without leaves. The small molecules pass readily through the kidneys and the large molecules are retained in the circulation for many hours—as long as one or two days. An untoward deposit effect such as has been noted with acacia does not occur with dextran and it does not seem to have an untoward effect upon the diabetic patient. At the moment dextran is prepared as a 6 per cent solution in normal saline. A tiny amount of mercurial antiseptic is present in the solution which seems to prevent it from becoming contaminated easily. A 10 per cent solution, salt-free, has been used for the relief of nephrotic edema.[6] I have not had any experience with this preparation.

The technical use of dextran, gelatin and periston is similar and the effect is comparable; I will speak about their intravenous administration, the quantities and rate of flow later.

The gelatin that I have used has been furnished largely by one company. The products of some companies are said to have a molecular weight of between 20,000 and 500,000. I have objected to the name "plasmoid" for gelatin used by one company, because of the possible inference that it was a substitute for plasma. I wish it to be thoroughly understood that if a patient needs blood he should have blood if it is available. Plasma can be used, but it is inferior in results to any one of the three special materials: dextran, gelatin or periston. The gelatin preparation which I have used is packaged in liter bottles. In a series of urologic operations done by the transurethral approach it was found that under certain conditions equally good results could be obtained from one bottle of blood rather than two, or from two bottles rather

---

Read at the meeting of the Minnesota State Medical Association, Duluth, Minnesota, June 13, 1950.

From the section on Anesthesiology, Mayo Clinic, Rochester, Minnesota.

than three if a liter of gelatin were administered.[5] This was found to be true in cases in which a record was kept of the loss of blood accurate to within a few cubic centimeters, and in which it was realized that two or even three bottles of blood should be administered to make up for lost blood or anemia or both.

When dextran was first produced the supply was small. It was not as good as it is now and occasionally it produced an anaphylactoid type of reaction among unanesthetized patients. When my supply was exhausted I used gelatin; I found it necessary to add a vasopressor substance oftener with gelatin than with dextran to get the same blood-pressure-raising effect. On the basis of my experience in 1949, I am confident that five lives were saved with dextran; the patients were in extreme shock and many liters of blood had been administered without result. I did not use more than three 380 c.c. bottles of dextran for any one patient. The improvement in blood pressure and in the general condition of each patient was decided and all recovered. I have had numerous patients in a state of slight shock whose condition improved considerably on administration of one bottle (380 c.c.) of dextran. I would be definitely handicapped in combating surgical shock without dextran, gelatin, or periston.

In Sweden dextran has been used in treatment of patients suffering from burns with excellent results. I cannot speak from personal experience since I have had the opportunity to try it only twice on burned patients. More than 75 per cent of the skin of each patient was burned and neither of them survived more than a day or two after hospitalization. As mentioned previously, however, my remarks are concerned particularly with treatment of surgical and anesthetic shock. I am of the opinion that gelatin plus a vasopressor will give practically the same results as dextran but for a shorter time.

Periston is a solution of polyvinyl pyrrolidone dissolved in Ringer's solution. It was introduced by Weese, a German, in World War II. It is a synthetic substance in the nature of a resin or it might be considered as a soluble plastic substance. The molecules are not large but they are inert except in dogs. Dogs have a special sensitivity to the substance and a shocklike condition develops from it. The German Wehrmacht used a 2.5 per cent solution of periston more than 100,000 times but it did not make too favorable an impression. A 3 per cent solution has about the same colloidal osmotic pressure as plasma and about the same as 6 per cent dextran in normal saline. Weese has written to me to say that the material should be used in a 3.5 per cent solution. I have tried various strengths and I agree that the 3.5 per cent solution is by far the best concentration.[7] With it I have been able to raise blood pressure, with doses as small as 285 c.c., to about the same level as with 380 c.c. of dextran or a liter of gelatin preparation. I have not seen untoward results from the use of the dextran, gelatin or periston. If storage phenomena occur I am not aware of them.

Morrison,[4] who bled guinea pigs to the extent of 3.5 c.c. per 100 gm. of body weight, reported that all animals died which were not treated. In other instances various solutions were infused at the rate of 1 c.c. per 100 gm. of body weight, and the results are as follows: all guinea pigs to which saline was administered died; nine of the ten which were given 2.5 per cent periston died but only four of the ten which received 3.5 per cent periston died; of those to which serum albumin or whole blood was administered none died; five of ten died when dextran was used, and two of ten died when plasmoid was used. Morrison's experiments on rats, with the use of the same procedure as that for guinea pigs, revealed that all died when replacement was not employed; nine of ten died when saline was used; three of ten died when 2.5 per cent periston was used; two of ten died when 3.5 per cent periston was used; one died when serum albumin was administered; none died when whole blood was administered; three of ten died when dextran was used, and two died when plasmoid was used Morrison's work does not bear upon surgical shock; the figures are interesting, however, in connection with an attempt to bleed animals only and to treat them for hemorrhage with several different materials.

Price of these materials is important to the patient when results are equally good with any of them. At the moment, gelatin is cheaper than dextran. Periston is not yet commercially available. When however, results are as gratifying as I obtained for the small series of patients treated with dextran in 1949, patients who otherwise probably would have died, price is not of prime importance.

In my experience as well as that of others expressed in the literature, no one has ever received an overdose of dextran regardless of how much has been given, provided the elevation of blood pressure did not become too great. By this I refer to dextran itself rather than to an overdose of fluids from the standpoint of volume as in a case of cardiac decompensation. Laboratory animals have been given tremendous doses every day for many days and have tolerated it well. My use of dextran has been conservative; I have never given more than three bottles (380 c.c. each) to any one patient during a continuous infusion.

Aside from treatment for surgical shock these materials might be useful in case of a disaster from the explosion of an atom bomb. It is to be hoped that dextran will be manufactured eventually in our own country and that, if investigators can find nothing seriously wrong with the use of periston, it, too, may be made available. If I had a word to describe this category of materials the definition of the expression would be "a substance which maintains the circulating volume in the cardiovascular system." I am without the word, but I wish to use the definition and to say that, in my opinion, the use of such substances in the treatment of surgical shock may give results which are beneficial or even lifesaving.

WHO REPORTS PROGRESS IN MALARIA CONTROL IN ASIA

A scientific investigation made by the Agricultural Officer attached to the WHO Malaria Control Demonstration Team which has been in operation in the East Bengal area of Pakistan for the last two years, has conclusively proved that malaria control results in a direct increase of the yield of crops and an appreciable decrease in the man hours of labor which have to be expended per acre.

In a report received at the Eastern Mediterranean Regional Office of the World Health Organization from Dr. G. Gramiccia, leader of the WHO Malaria Control Team in Pakistan, particulars of this investigation are given. Surveys were made of the acreage planted with rice, of the number of hours worked per acre, the number of laborers employed, the yield of rice and straw per acre and the number of working hours lost due to illness, in a number of holdings where DDT spraying had been carried out, and also in other holdings which were not sprayed, for control purposes. Since weather and other conditions affecting crop yields were the same for both types of holdings, the 15 per cent increase of yield in the DDT sprayed areas and the decrease of man hours of labor required per acre of over 10 per cent in the same areas, can be fairly attributed to the malaria control work carried out. A further proof is the fact that, in the DDT sprayed areas, no working hours were lost due to illness whereas in the unsprayed control areas, there was a loss of working hours of 2.2 per cent.

The report adds that similar investigations are being conducted in relation to the jute crop, rice and jute being the two principal agricultural products of East Bengal.

The spraying operations for the season in the WHO demonstration area of East Bengal have now been completed 193 square miles with a population of 24,000 souls having been sprayed. Direct investigation of the incidence of malaria has shown that excellent results have been obtained in the control of the disease. No malaria infection was encountered in infants up to one year of age during an investigation of the areas sprayed in 1949 and 1950, or in 1950 only, whereas in the unsprayed control areas, there was an infant parasite rate of 7.1 per cent. Spleen rates and parasite rates in adults showed a considerable decrease in the sprayed areas as compared to the unsprayed areas.

Apart from malaria control work, the WHO demonstration team in East Bengal has established a maternal and child health clinic from which skimmed milk is distributed among children and nursing mothers.

The Pakistan Government has established additional malaria control teams in order to extend the area of operations.

NEWER ASPECTS OF URINARY TRACT INFECTIONS

Diagnosis

BAXTER A. SMITH, JR., M.D.
Minneapolis, Minnesota

THE advances in the medical and surgical management of urinary tract infections have made the importance of accurate diagnosis more essential, rather than less important, as one at first might think. At the present time, one has a good chance to conserve renal function which would have been considered beyond retrieve fifteen years ago. One may apply conservative therapy rather than excision and may be able to avoid multiple stage procedures, which would have been considered unwise a decade ago. In order to determine whether medical or surgical treatment is indicated and the proper type of therapy in both, diagnosis must be as precise as possible.

The general recognition of several new entities of diagnosis and types of infection has appeared. The flora of urinary tract infection has changed somewhat since the advent of the present antibacterial agents.

In diagnosis, the standard methods still apply and no short cuts have been recognized. The history and physical examination remain the same and still have their same importance. Palpation of the prostate and examination of the wet prostatic smear are imperative in all urinary tract infections in the adult male. The presence of cervicitis may prevent permanent clearing of infection of the urinary tract.

Some new advances in examination of the urine have been made. Gross inspection, the two glass test, and microscopic examination of the centrifuged sediment in the wet spread are essential. Very often bacilli are seen in abundance with the high dry lens in the unstained preparation. The absence of pyuria or organisms in the second glass, with pyuria in the first glass, excludes the upper urinary tract as the source of pyuria for practical purposes. The sediment of a voided urine from the female is of value only if negative.

Stain of the urine with methylene blue or Gram's stain will usually denote the type of organism present. Culture is necessary to determine the exact infecting organism and in all serious or resistant infections, should be undertaken. In the presence of stone with infection, culture is essential.

If culture shows no growth and antiseptics and antibiotics have not been given recently enough to inhibit growth, tuberculosis must be excluded. Anaerobic infections, such as urinary tract brucellosis or micro-aerophilic streptococcic infection may be present.

Reiter's disease and amicrobic cystitis or "sterile pyuria" have been considered as virus diseases, but proof has been lacking. The status of pleuropneumonia organisms in the genitourinary tract is not settled.

Bacteriological flora of urinary tract infections has changed somewhat since the advent of the antibiotics. Aerobacter aerogenes is a much more frequent offender, and I believe pseudomonas aeruginosa is also, at least where multiple granulating wounds are present as in the service hospitals.

Stain of the urine for tumor cells may be indicated in determining the cause of resistance of infection to treatment and in differential diagnosis.

The presence of stasis, calculus, necrosis, or foreign body in the urinary tract makes treatment of infection difficult or impossible. Stasis in the bladder may be determined by checking the residual urine by catheter, or by a film after voiding during excretory urography. It should be emphasized that females may carry residual.

Excretory urography is indicated in all cases of serious infection, recurrent infection, or of resistant infection in the urinary tract, if total renal function is satisfactory, to exclude stasis, calculus, necrosis, and foreign body. The importance of the plain film preliminary to the injection of dye is emphasized lest stone or foreign body be obscured by the dye. Compression over the region of the iliac crossing of the ureters will usually effect satisfactory filling of the collecting system.

An excretory urogram will not exclude lesions of the bladder. It usually will give sufficient information to determine whether retrograde

---

Read at the annual meeting of the Minnesota State Medical Association, Duluth, Minnesota, June 13, 1950.

pyelography is indicated, but may not exclude lesions minor as to size, such as tuberculosis, epithelioma, or cicatricial pyelonephritis. It frequently will not determine the extent or type of gross disease. Small cortical abscesses and perinephric infection may not give definite pyelographic findings.

The excretory urogram is a good general test of renal function and is of great value relative to determination of the status of the uninvolved kidney in unilateral disease warranting surgery, conservative or radical.

A voiding cystogram, with a film taken just at the conclusion of voiding, will indicate the significance of vesical diverticula in diverticula of questionable importance.

Cystoscopy is necessary to rule out vesical lesions contributing to infection, and operative cystoscopy may cure the lesion, such as ureterocele or vesical papilloma. By indigo carmine excretion, the relative function of the two kidneys may be estimated, but a hypoplastic kidney incapable of supporting life may show a good excretion of indigo carmine.

Retrograde pyelography will give necessary information where excretory urograms may fail and is always indicated when one is in doubt. In the determination of borderline renal function of a kidney, the excretion of phenolsulfonphthalein or the clearance of urea may be determined quantitatively, but it is essential that catheter drainage be good and that all the renal urine be collected. This may be accomplished by using a good-sized bulb catheter or a Garceau catheter. The use of an acorn or bulb catheter gives the best pyeloureterogram. Lateral or stereo films may be very informative. Distention of the renal pelvis, and the making of an upright "emptying film," taken ten minutes after filling the pelvis with dye, may be necessary to determine the significance of otherwise questionable stasis or pain.

With obstruction to the upper urinary tract, estimation of potential function may be possible only after several days of drainage by inlying ureteral catheter and/or the remission of acute infection.

At the present time, mannitol or inulin clearance for glomerular filtration and the diodrast or para-aminohippuric acid clearance for tubular mass determinations do not seem practical except under the supervision of an excellent physiological chemist. The tubular mass and blood flow can be determined accurately by catheterization of the renal vein.

Conclusions

Whereas the antibiotics and chemotherapeutic agents have eased the problem of urinary tract infection no end, diagnosis frequently must be more accurate than before, relative to type and degree of infection and impairment of renal function. Only then can full advantage be taken of the possibilities offered by these medications and improved surgery in the preservation of renal function, our main concern.

A REPORT ON PROPAGANDA BECOMES PROPAGANDA

By slur and smear, the report of the house select committee to investigate lobbying, under the chairmanship of Rep. Frank Buchanan of Pennsylvania, *holds up to public contempt books, articles, and public discussion which find fault with the Truman administration.* The critics are represented as a "billion dollar industry" in lobbying.

On the contrary, the activities of administration spokesmen to influence public opinion and voting on legislation are described as "duties of leadership in matters of public policy" inherent in their "relation to the chief executive." In other words, any bureaucrat who speaks for Mr. Truman and the bureaucracy is discharging a duty; any private citizen or group of individuals opposing the administration is an enemy of the people.

It does not require any very searching examination of these theses to determine that Mr. Buchanan and his "Fair Deal" associates have themselves *unloaded a piece of cunning propaganda under the guise of a report on propaganda. They have used the pretext of investigating lobbying to engage in lobbying.* They are lobbying for big government—specifically, Mr. Truman's big government, and for the liquidation of dissent.

Sen. Taft, opportunely speaking on this subject the same day that Mr. Buchanan's majority burst into print, said that the Truman investigating committees are covering up corruption with whitewash.

The object of the corrupt Truman administration is to corrupt the judgment of the public, so that when everybody has sunk to a similar degradation, the political burglars can steal without even attracting notice. To this cause Mr. Buchanan and his associates have contributed what they could. To say that a few millions spent by people devoted to the Republic and to honesty in public affairs is wrong, while at the same time the Truman administration walks off with 60 or 65 billions of the people's money, is simply a diversionary clamor to cover the flight of the bureaucratic John Dillinger.—*Chicago Tribune,* October 7, 1950.

OFFICE TREATMENT OF URINARY TRACT INFECTIONS

HAROLD J. WALDER, M.D.
Duluth, Minnesota

With the addition of numerous drugs to the armamentarium available for therapy in urinary tract infections, the physician occasionally finds it difficult to decide which agent to employ in an individual instance. A brief discussion of the most important urinary antiseptics and the situations in which they may be utilized to best advantage would appear to be in order.

In an effort to see which organisms we most frequently encountered in the practice of urology, we reviewed the results of 220 consecutive urine cultures, which were reported in our office practice and in two Duluth hospitals (Table I). In column 1 is shown the number of times the various organisms were encountered in this series. Column 2 designates those organisms which split urea. Column 3 indicates their reaction to the Gram stain. Note that the Gram-negative organisms occurred approximately two and one-half times as frequently as the Gram-positive organisms.

I have reviewed the work of several authors, and on this chart have endeavored to evaluate the effectiveness of the various drugs against organisms usually found in the urinary tract. Their effectiveness against these organisms is graded as 1-plus to 4-plus, the drug being most effective against those organisms where the 4-plus occurs. The vacant squares in the chart indicate that the drug or antibiotic has little or no known value in inhibiting or destroying that organism in the genito-urinary tract.

Perhaps the most venerable urinary tract antiseptic is hexamethylenamine, otherwise known as methenamine or "Urotropin." Its effectiveness depends upon the splitting off of formaldehyde in the presence of an acid medium. It is not an antiseptic in its own right, and has been shown by Helmholz to be efficient only when the urine is maintained at a pH close to 5. Time has proven the ineffectiveness of this urinary antiseptic in the majority of infections, but this should not blind one to the fact that methenamine has always been curative in some cases, and that it may be found the only agent, when all others have failed, that will bring about sterilization of the urine.

TABLE I.

Organism	220 Cases	Split Urea	Gram Stain	Mandelamine	Sulfa	Sulamyd	Gantrisin	Penicillin	Streptomycin	Aureomycin } —Lederle Duomycin Chloromycetin—Park Davis Terramycin—Pfizer & Co.

Total Gram-Negative Organisms 172
Total Gram-Positive Organisms 71

Following the discovery that ketogenic diets with the accompanying acidosis were effective in the treatment of chronic bacillary urinary infections, the use of mandelic acid was proposed by Rosenheim. It often induces nausea and vomiting, and after prolonged administration may produce hematuria with casts in the urine.

Very little has been written about methenamine or mandelic acid, *per se,* since 1939. Many physicians now use mandelamine, which is a combination of the two, and it is believed to be more effective than either alone. In 1946, Carroll and Allen reported on the treatment of 200 cases with mandelamine. They pointed out that Escherichia coli is susceptible to the antibacterial action of mandelamine. Eighty-five per cent of their cases responded to treatment. This organism was the most frequently encountered and was responsible for approximately 50 per cent of the urinary tract infections in their series and in ours.

Read at the annual meeting of the Minnesota State Medical Association, Duluth, Minnesota, June 13, 1950.

From the Department of Urology, Duluth Clinic, Duluth, Minnesota.

Proteus vulgaris and Aerobacter aerogenes are highly resistant to this drug. These organisms resemble Escherichia coli in staining and cultural characteristics to such an extent that they are often reported as such. It therefore seems advisable that any Gram-negative rod which resists mandelamine therapy should be investigated further for identification, since the organism may be found to be either a Proteus or an Aerobacter aerogenes. Unfortunately, these organisms are also highly resistant to sulfonamides and penicillin.

Mixed infections due to Escherichia coli and Staphylococci comprised 23 per cent of the cases in this series. Based on the work of Carroll and Allen, only about half of these cases respond to mandelamine alone. However, they showed that if these cases are given mandelamine plus penicillin, results are gratifying—the penicillin being effective against Staphylococci, mandelamine against Escherichia coli.

In all except eight cases treated by Carroll and Allen, the urine remained or became acid while receiving a total of three mandelamine tablets four times a day, without other medication or restriction of diet or fluid intake. The eight patients whose urine remained alkaline were resistant to therapy. Of these, three showed Proteus vulgaris which should respond to streptomycin therapy, and five showed Staphylococci which should respond well to sulfa or penicillin therapy.

The sulfa drugs vary in their effectiveness against various organisms. The factors of solubility in the urine, toxicity, and variations in antibacterial activity must be considered. Trisulfa combinations have been recommended because of their individual solubilities, and they are said to be less toxic than any one sulfa alone. However, Dr. Spink, of the University of Minnesota, objects to sulfathiazole because it produces vacuolization of the renal tubules and other toxic effects. He prefers sulfamerazine and sulfadiazine. Some of the newer trisulfa compounds have sulfamethazine in combination with sulfamerazine and sulfadiazine.

Sulfacetamide (commercially sold as "Sulamyd") has the advantage of high solubility, even in the physiological acid range of the urine, thereby minimizing almost to a negligible point the danger of crystal formation. In addition, it combines the features of good antibacterial activity, low toxicity, and rapid renal elimination, resulting in high urinary level. *In vitro* experiments with bacteria isolated from infections of the urinary tract, performed by Lehr, indicate its effectiveness in the concentrations usually maintained in the urine of a patient under treatment with standard dosages. It is recommended that 3 to 4 gm. be given daily for the first two or three days of the acute urinary infection, followed by 2 gm. (0.5 gm. four times daily) for an additional five or six days. Alkalinization of the urine does not appear to be necessary. However, the incidence of loss of appetite, nausea and vomiting is high, and when it is used in office treatment, the patient should be warned of these possibilities.

Gantrisin is an effective chemotherapeutic agent in some infections caused by Escherichia coli, Pseudomonas aeruginosa (B. pyocyaneus) and Proteus bacilli. Reports of its value in treating infections due to the latter two organisms become more questionable as the drug is more extensively used. Also, there appears to be no relation between the blood or urine sulfonamide levels and its bacteriostatic properties. Reactions similar to those occurring with other sulfonamides occur during the administration of gantrisin. Crystalluria, however, is not observed either in an acid or an alkaline urine.

The introduction of penicillin with its potency in combating coccal infections immediately led to its use in this group of infections, and it has found its chief usefulness in the treatment of Staphylococcus aureus and albus and beta hemolytic streptococcus. Recently, it has been noted that although no resistant strains of gonococci are reported, there are strains of Staphylococci which are developing resistance to this antibiotic. It has almost no place in the treatment of infections caused by Streptococcus faecalis and fails utterly in those produced by Escherichia coli and Pseudomonas aeruginosa (B. pyocyaneus). Initial high dosage is important. However, the necessity for maintaining a consistently high blood level has been overemphasized in recent months. In urinary tract infections, 100,000 units of crystalline penicillin G in water every twelve hours in sufficient in practically all cases. For oral dosage, one should give five times as much as by intramuscular injection. It should be given on an empty stomach. In using penicillin, observe the patient for delayed penicillin reactions a week or so later, such as urticaria or serum-sicknesslike disorders.

Streptomycin has been shown to be effective against various Gram-negative bacilli frequently responsible for urinary infections which are refractory to sulfonamides and penicillin. Most of the large medical centers have laboratory facilities for determining streptomycin sensitivity on urine cultures, but this service has not been available to many physicians.

The results of streptomycin therapy are most impressive in infections caused by Escherichia coli, Aerobacter aerogenes, Proteus ammoniae and vulgaris. Pseudomonas aeruginosa and certain strains of Streptococcus faecalis respond only moderately well (Adcock). Using 2 to 3 grams of streptomycin daily, a blood level of 20 units per c.c. of serum can be attained, and those organisms falling within this range of sensitivity, as determined by *in vitro* studies, may be considered susceptible to therapy. In urinary infections it has been determined that 1 gram per day is sufficient.

The effectiveness of streptomycin is enhanced when the urine is alkaline; around a pH of 7.2 to 7.4. This generally can be attained by the oral administration of sodium bicarbonate or sodium citrate. Potassium citrate may be substituted for the sodium citrate when the cardiac status of the patient poses a problem. When streptomycin is effective, the bacteria generally disappear from the urine in three to seven days.

The neurotoxic effect of the drug on the vestibular apparatus rarely occurs during the usual ten-day course of therapy. It has recently been pointed out that delayed loss of hearing is much more frequent with dihydro-streptomycin than with streptomycin; therefore, Spink and others are avoiding the prolonged use of dihydro-streptomycin.

Aureomycin, chloromycetin and terramycin are all of advantage against essentially the same Gram-negative bacillary infections and Gram-positive cocci, especially those that are resistant to penicillin. They are primarily bacteriostatic and not bacteriocidal. While I have listed these antibiotics together, it is well not to think of chloromycetin as interchangeable with aureomycin. Chloromycetin is not as effective as aureomycin in Staphylococci infections, but it is more effective in Proteus infections. Generally speaking, the dosage of chloromycetin should be approximately two times that of aureomycin or terramycin. Three gm. are recommended the first day, 2.0 gm. for five successive days, then 1.0 gm. daily for an additional four days, all doses being appropriately divided. Results are favorable with this regimen. The drug is well tolerated and devoid of gastrointestinal, neurotoxic, cutaneous or allergic reactions.

If aureomycin is given with milk on an empty stomach, there is less intestinal upset and no decrease in absorption.

Thus we see, when we glance at the chart, that no one drug is effective against all organisms. A Gram stain of the urinary sediment suggests which drug or antibiotic might be most effective, even though the organism has not been specifically identified.

Reports vary in the incidence of finding both bacillary and coccal infections from 21 per cent up to 65 per cent. If one finds both Gram-positive and Gram-negative organisms, there is more than a 50 per cent chance that the Gram-negative organism is Escherichia coli and, therefore, chemotherapy or some antibiotic should be used which is effective against this organism, plus selected therapy against the Gram-positive organisms. In the office treatment of urinary tract infections a combination, such as mandelamine plus penicillin, or sulamyd or gantrisin plus penicillin, may be desirable.

Prior to the advent of sulfonamides in the middle of the last decade, the chemotherapy of urinary infections was more or less on an empiric basis. Whatever benefits were derived from the therapeutic agents were probably the result of changes in the pH of the urine with varying bacteriostatic effect.

During the past ten years, several clinical reports have appeared in the literature on serenium and pyridium. Although one may accept the fact that they do not meet the modern criteria for a "urinary antiseptic," and apparently none of the urinary antiseptics do, they are bacteriostatic against some of the pyogenic organisms and are said to have analgesic effect upon an inflamed mucosa. They are contraindicated in chronic parenchymatous nephritis, especially in patients with a low phenolsulfonphthaline output. We have used these products frequently, but we are never sure in just which cases they will be most advantageous.

Regardless of the form of therapy used, a follow-up of cases of urinary tract infections treated in the office is most important. We should endeavor to define our results as: (1) controlled —symptom free, urinary cultures sterile; (2) improved—symptom free or clinically better, but urinary smears or cultures positive; and (3) unimproved—symptoms and cultures unchanged. This also includes those cases which have relapses.

Of interest is the fact that a remarkable change has been observed in the bacterial flora of urinary tract infections. Especially striking is the decided increase in the frequency of isolating Aerobacter aerogenes and Pseudomonas aeruginosa (B. pyocyaneus). Several authors have noted this trend. Dr. Grayson Carroll believes it is due to the oragnisms' resistance to antibiotics and other drug inhibitors, and as time goes on, these surviving strains will, undoubtedly, constitute a higher percentage of urinary infections as the more susceptible strains are destroyed. It is evident that asepsis must be diligently practiced, when it is realized that such an infection carried to another patient is so pathogenic and so difficult to treat successfully. We are again in need of a new weapon to fight these surviving bacteria. On glancing at the chart, note that the new antibiotics are only moderately effective against Aerobacter aerogenes and of no value against Pseudomonas aeruginosa.

In discussing these two resistant organisms, two new antibiotics should be mentioned. Polymyxin has been shown to be fairly effective against Pseudomonas aeruginosa; and neomycin is effective against Pseudomonas and Proteus infections. However, they have both been found to be nephrotoxic and will probably not appear on the market for general use.

In summary then, urinary tract infections should first be investigated—at least by a Gram stain; then the mode of therapy most effective against the etiologic agent should be used.

ARMY DECENTRALIZES APPOINTMENTS FOR MEDICAL DRAFT REGISTRANTS

The inauguration of a decentralized system of Reserve officer appointments, which will expedite action on applications made by draft-eligible physicians, dentists, and veterinarians, has been announced by Major General Raymond W. Bliss, Army Surgeon General.

Under the new system, the entire processing of Reserve commissions will be accomplished in the six continental army areas and overseas commands for applicants now enrolled under the current draft call. Commissions will be issued by army commanders and overseas commanders to applicants who qualify without referral to the Department of the Army.

For those subject to induction by Selective Service, the following procedure will be followed:

Initially, the registrant will fill out a questionnaire that will include a statement as to whether he desires to accept a commission. This questionnaire will accompany him to his local induction station when he reports for his physical examination. At that time he will be given another opportunity to indicate his willingness to accept a commission, if he has not previously so indicated.

Records will then be forwarded to the appropriate army headquarters where the qualifications of the registrant will be determined. If qualified, the army commander will send the registrant a letter of appointment in an appropriate grade in the Medical, Dental or Veterinary Corps Reserve, with instructions to complete an oath of office within seventy-two hours and notify his selective service board of his commissioned status.

Physicians and dentists accepting commissions under these circumstances will receive the special $100 authorized pay for volunteers.

SIGNIFICANCE AND MANAGEMENT OF SPONTANEOUS PNEUMOTHORAX

W. R. SCHMIDT, M.D.
Minneapolis, Minnesota

SPONTANEOUS pneumothorax occurs more frequently than we realize. At an Army induction center one in 500 examined gave a history of having had a spontaneous pneumothorax.[3,7] It is likely that many of the minor episodes are never diagnosed and are treated as an attack of "pleurisy."

In the majority of our cases there has been no history of abnormal exertion; the symptoms most commonly noted are pain in the chest, usually severe, dyspnea, and frequently cough. The classical physical findings of pneumothorax are present when the lung is collapsed about 40 per cent of its normal volume. A good chest x-ray taken in the upright position will confirm the diagnosis.

There has been considerable confusion as to the significance of an attack of spontaneous pneumothorax. This is not surprising when one considers that in the 1930's it was common teaching in many medical schools to regard tuberculosis as the etiological agent in 95 per cent of all cases. Cecil's *Textbook of Medicine* in the 1940 edition[2] states that 80 per cent are of tuberculous origin. However, since 1933 a number of case reports have been published in which the authors[4] stress the frequency in which spontaneous pneumothorax has occurred in patients with no pulmonary disease, tuberculous or otherwise. A study of 100 Massachusetts General Hospital patients with spontaneous pneumothorax by Meyerson[5] revealed that thirty-six had no demonstrable pulmonary disease, while in sixty-four the pneumothorax was secondary to some pre-existing pulmonary disease. About half of those with pulmonary disease had tuberculous infiltrations; however, the number with activity is not stated.

A study of twenty cases of spontaneous pneumothorax admitted to this hospital reveals the figures shown in the accompanying tabulation.

FINDINGS IN TWENTY CASES OF SPONTANEOUS PNEUMOTHORAX

Age	15 to 30
Number of those with previous attacks	7
Bilateral attacks	1
No history of exertion	17
Pain	20
Severe pain	9
Cough	5
Dyspnea	13
Positive Mantoux	6
Fibrotic infiltration on chest x-ray	5
Emphysema with blebs	2
Negative chest x-rays	13
Total cases	20

It is of interest to note that a history of exertion occurred in only three cases. Three patients first noted the onset of pain when awakening from sleep. Four patients were treated initially as having an attack of "pleurisy" with taping of the chest. One patient was thought to have a "coronary attack," and several electrocardiograms were made before a chest x-ray revealed the proper diagnosis.

Our attitude towards this problem may be summarized as follows: Spontaneous pneumothorax usually occurs because of a rupture of a bulla or bleb on the lung. In a majority of the cases the bleb represents a congenital or acquired weakness in an otherwise normal lung. In others the bleb is a natural sequence of some underlying pulmonary disease such as pulmonary tuberculosis or cystic disease. It is of great importance that we recognize this distinction in the pathogenesis of the pneumothorax as the after-care of the two groups differs.

With this in mind we can formulate a rational plan of management of the patient following recovery from the pneumothorax. In the group that has no demonstrable pulmonary disease we can be reasonably sure the patient will remain in good health; we need not restrict his physical activity beyond a very short recovery period. He must be warned that he has a 14 to 20 per cent chance of a recurrence of the pneumothorax either on the same side or, less likely, on the contralateral side. As a precautionary measure, follow-up chest x-rays can be obtained every six months for a period of two years. In the group in which the x-ray reveals or history strongly indicates underlying pulmonary disease, his follow-up care is dependent on the type of pulmonary disease present. If, for example, there is an area of infiltration suggestive of tuberculosis (and this may appear quite innocent), thorough investigation to rule out activity

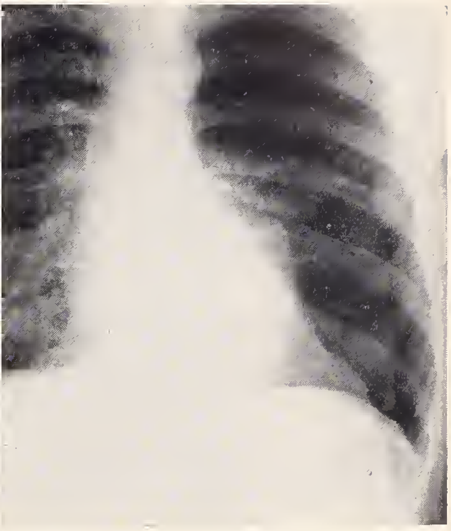

Fig. 3. Case 1. Film, May, 1950. Left lung collapsed. Chronic pneumothorax.

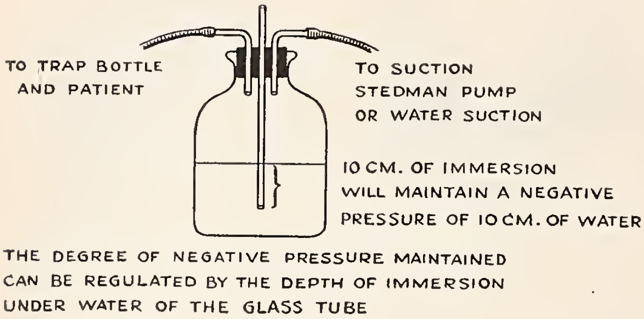
of the lesion is in order, including several sputum and gastric washing cultures. Even when the lesion appears to be inactive, the patient must be followed more carefully than those in the first group. While the number of patients who develop a progression of their tuberculous lesion will be small, we have seen a fair number of patients admitted to the Veterans Administration Hospital with far advanced tuberculosis who gave a history of a spontaneous pneumothorax several years prior to admission. Review of the x-rays taken during the time of the pneumothorax will usually show a small area of infiltration suggestive of tuberculosis.

The management of the patient who develops a spontaneous pneumothorax will vary according to the severity of the attack. Minor degrees of pneumothorax, especially if seen several days after the onset, may require nothing more than symptomatic treatment with the patient remaining on an ambulatory basis. The more severe degrees of collapse require hospitalization. It is common practice in most institutions to allow the lung to remain collapsed on the theory that the fistula will heal more rapidly. The air will then absorb and the lung expand. Undoubtedly most cases will respond to this form of therapy, and when the lung expands quickly and steadily, it will be the treatment of choice.[1] However, when the lung fails to expand steadily and where relapses occur, this method becomes wasteful and should be abandoned for more active therapy. Prolonged hospitalization and loss of time from work is a considerable economic burden to most individuals. Since the pneumothorax in the majority of instances can be regarded as a mechanical accident to an otherwise perfectly healthy individual, it becomes the duty of his physician to restore him to a normal state in a reasonable period of time. The expectant treatment, when unduly prolonged, has an additional disadvantage in that in an occasional case the collapsed lung will become trapped in its abnormal position by a fibrin and later fibrous membrane forming over the visceral pleura. Expansion of the lung then becomes difficult or impossible without open thoracotomy and decortication of the fibrous "peel" from the lung.

The following case report is an example of this complication:

Case 1.—L. E., aged thirty-six, was admitted to the Minneapolis Veterans Hospital on February 28, 1950, because of an extensive spontaneous pneumothorax on the left (Fig. 1). He had had a similar episode in 1947 for which he was treated by three months' bed rest with recovery. Four days after this admission the chest was aspirated and 1000 c.c. of air removed. The subsequent roentgenogram showed almost complete re-expansion (Fig. 2). The collapse, however, returned. Unfortunately, the patient refused more active type of therapy and was continued on bed rest. Eight weeks after the admission reaspiration was done and the lung found to be trapped in the collapsed position by a thickened membrane over the visceral pleura. Decortication was suggested on April 26, 1950, but refused by the patient who left the hospital on May 29, 1950, with a chronic pneumothorax (Fig. 3). The patient has a 10 per cent chance of getting a pneumothorax on the contralateral side which could easily result in sudden death.

In this case, when collapse recurred, more active therapy, namely catheter suction of the pleural space, in all probability would have restored him to a normal status in a few days.



TO TRAP BOTTLE AND PATIENT
TO SUCTION STEDMAN PUMP OR WATER SUCTION
10 CM. OF IMMERSION WILL MAINTAIN A NEGATIVE PRESSURE OF 10 CM. OF WATER
THE DEGREE OF NEGATIVE PRESSURE MAINTAINED CAN BE REGULATED BY THE DEPTH OF IMMERSION UNDER WATER OF THE GLASS TUBE

Fig. 4.

In the event that expansion is not proceeding satisfactorily after several days of bed rest, it is suggested that the air be removed by needle aspiration. There is little danger of producing a high negative intrapleural pressure and thus reopening the fistula by this maneuver since the lung in this early stage will be readily expandible and will fill the pleural space as rapidly as the air is removed.[3]

Failure of the air leak to close promptly (and this is indicated when the lung fails to expand after needle aspiration or when the pneumothorax recurs after aspiration) is an indication for continuous aspiration. An additional indication for this type of therapy is the development of a tension pneumothorax which is a constant source of danger to the patient unless promptly and continuously relieved. Continuous aspiration of the air is easily accomplished by insertion of an intercostal catheter. This is a simple bedside procedure using local anesthesia and a trochar. The catheter is attached to a suction apparatus. We use a Stedman type of suprapubic pump. If no other pump is available, a water faucet suction attachment will be satisfactory. Some type of mercury or water breakover mechanism must be interposed in the suction line in order to avoid producing too high a negative pressure. A negative pressure of 10 cm. of water is ideal. A satisfactory type of regulator which can be made in a few minutes from material readily available in any small hospital is described by Overholt[6] and is shown in Figure 4.

The following case report demonstrates the indications for catheter suction:

Case 2.—Mr. G. B., aged twenty-nine, was admitted July 25, 1950, because of a right spontaneous pneumothorax occurring on July 11, 1950. He was treated for one week by bed rest at which time his dyspnea increased. Chest aspirations were then done with failure of the lung to expand. On admission to the Veterans Hospital the right lung was about 80 per cent collapsed; catheter suction was immediately instituted. Re-x-ray of the chest twelve hours later showed complete expansion. The tube was clamped and removed after a trial of ambulation failed to reopen the fistula. The patient was discharged completely recovered on July 31, 1950, with instruction to have follow-up x-rays at six-month intervals.

Almost invariably the lung expands promptly with this method and remains expanded. The majority of the air leaks will close with great rapidity when the visceral and parietal pleura are maintained in contact by continuous suction for a period of twenty-four to forty-eight hours. When the lung expands, the patient will experience considerable pain requiring opiates for relief. After the lung has been expanded for twenty-four to forty-eight hours, the tube may be clamped and suction discontinued. The tube is then removed as soon as it is evident that the pneumothorax is not recurring.

On removing the catheter, it is well to seal the opening in the chest with collodion and cotton for a few hours to prevent any sucking of air back into the pleural space.

The patient who is afflicted with several recurring attacks of pneumothorax, and particularly when there is a history of bilateral involvement, is best treated by obliteration of the pleural space. This has been accomplished by the induction of a chemical pleuritis with various irritants such as hypertonic glucose, silver nitrate (Brock[1]) and iodized talc (Bethune). We have abandoned other methods in favor of open thoracotomy with scarification by dry gauze of the visceral and parietal pleura along with clamp excision and suture of the bleb and fistula. Suction catheters are introduced into the chest to maintain full expansion in the immediate postoperative period. This procedure is safe, and since it can be done without waiting for the patient to recover from his current attack of pneumothorax, will not require more than a week of hospitalization. The resulting pleural symphysis will prevent recurrence of a pneumothorax that is frightening to the patient as well as disabling and at times dangerous. The following case history illustrates an example of this therapy:

Case 3.—Mr. K. L. L., aged twenty-six, was admitted to the Minneapolis Veterans Hospital on April 21, 1950, because of a left spontaneous pneumothorax. There was a history of an initial attack in 1943 followed by recurrences in August, 1947, June, 1948, and June, 1949. All were on the left side. They were not associated with exertion. Mantoux tests were negative. Thoracotomy with scarification of the left visceral and parietal pleura was done on May 1, 1950, and the patient discharged on May 9, 1950.

The occasional case of chronic pneumothorax with a nonexpandible lung is treated in a similar manner as demonstrated by the case shown below:

Case 4.—Mrs. B. was admitted to St. Mary's Hospital on the service of Doctor T. J. Kinsella on January 2, 1949, because of a chronic pneumothorax of many months' duration (Fig. 5). She had had the various methods of conservative management including re-expansion of the lung with catheter suction on two occasions. The pneumothorax, however, promptly recurred. Finally a membrane formed over the visceral pleura trapping the lung in its collapsed position with the fistula remaining open. She was treated by open thoracotomy and decortication of the lung. The open fistula was easily seen in a nest of blebs on the lingula of the left upper lobe. The fistula and blebs were removed by clamp excision of a small peripheral portion of lung parenchyma with suture behind the clamps. The lung expanded readily. She has been well since (Fig. 6).

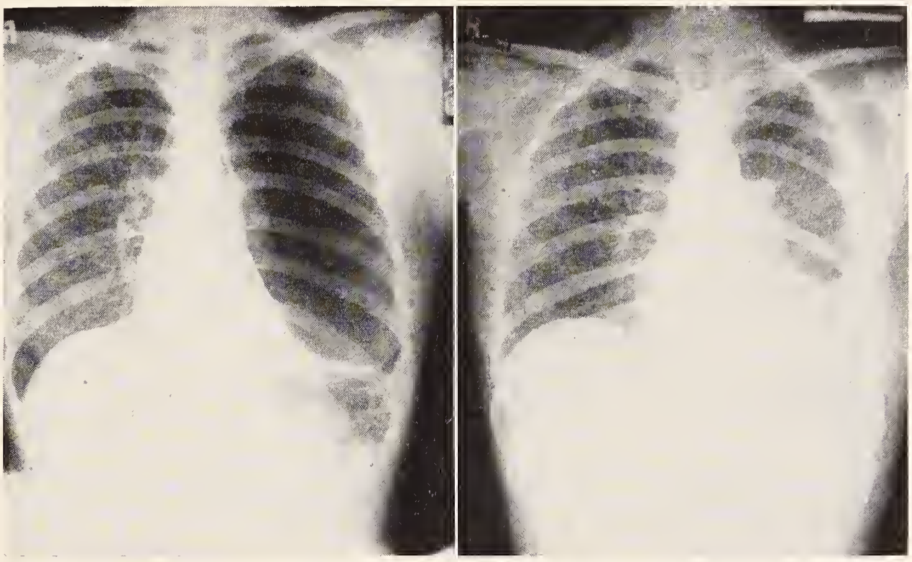


Fig. 5. (*left*) Case 4. X-ray, January 3, 1949. Chronic pneumothorax, left.
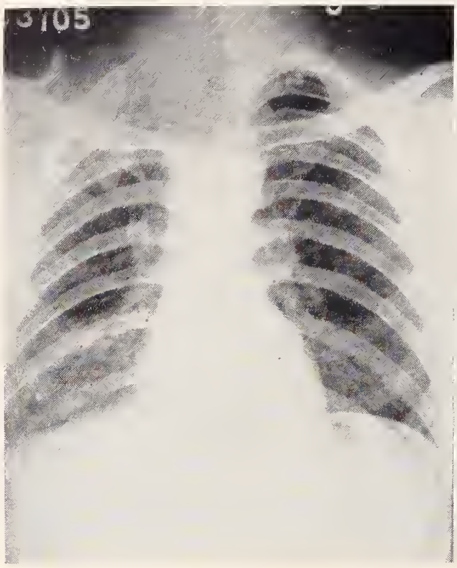
Fig. 6. (*right*) Case 4. X-ray, January 15, 1949. Postoperative re-expansion, left lung, after decortication, excision of blebs and fistula, and scarification of the pleura.

Spontaneous pneumothorax may occur as a complication of surgery. This is particularly hazardous in chest surgery when it occurs in the contralateral side. We have had two deaths in patients who had undergone pneumonectomy and developed a spontaneous pneumothorax on the opposite side postoperatively. It can and does occur following other types of surgery. Every surgeon and anesthetist must be aware of the possibility of this complication in patients who develop respiratory difficulties during anesthesia without other adequate explanation. The anesthetist can readily feel for the trachea which may be shifted from its normal midline position to the side opposite the pneumothorax. The chest will be hyperresonant to percussion. Insertion of a needle into the pleural space which will allow release of the tension pneumothorax is a lifesaving procedure.

The diagnosis may be difficult when the pneumothorax occurs in the postoperative period. Good x-rays are difficult to obtain in a patient who is very dyspneic. Consequently the diagnosis here at times must be based on physical examination alone. The presence of amphoric breathing and hyperresonance to percussion may be the clues to the proper diagnosis. The following case affords a typical example of this problem.

Case 5.—A. S., a Veterans Hospital patient, aged thirty-eight, was admitted on March 3, 1949, because of tuberculosis involving the right upper lobe (Fig. 7). In June, 1946, he had had a right pleural effusion and in March, 1947, a right spontaneous pneumothorax. The lesion in the right apex was present at that time. He was admitted to this hospital in March, 1949, because of progression of the lesion with sputum positive for tubercle bacilli. A three-stage thoracoplasty was done in July, 1949, and a right upper lobe lobectomy on May 10, 1950, because of failure of the thoracoplasty to convert the sputum.

His postoperative course was uneventful except for atelectasis of the right middle and lower lobes which necessitated bronchoscopic aspiration on the second postoperative day, May 12, 1950. A routine film of the chest was obtained immediately after this latter procedure to check on the progress of the atelectasis. Shortly after this procedure the patient became very dyspneic. The attending staff was not aware of the film showing the pneumothorax, and a portable bedside film obtained when the patient was very dyspneic was so blurred by motion that it did not contribute to the diagnosis. The physical findings were not thought to be suggestive of pneumothorax. The true situation was recognized the following day and the air removed from the left chest with prompt improvement in symptoms.



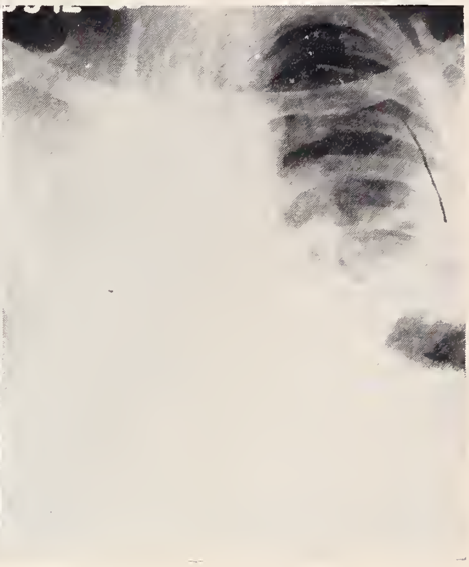


Fig. 7. (*left*) Case 5. Film, May, 1949. Tuberculosis, right upper lobe. History of spontaneous pneumothorax in 1947.

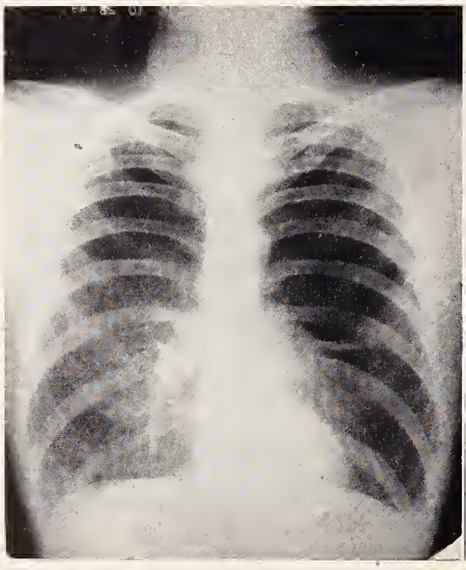
Fig. 8. (*right*) Case 5. Film, May 12, 1950. Patient developed left spontaneous pneumothorax four days postoperatively (right upper lobe lobectomy under thoracoplasty). This occurred two hours after bronchoscopy to relieve right lower lobe atelectasis (photograph retouched).



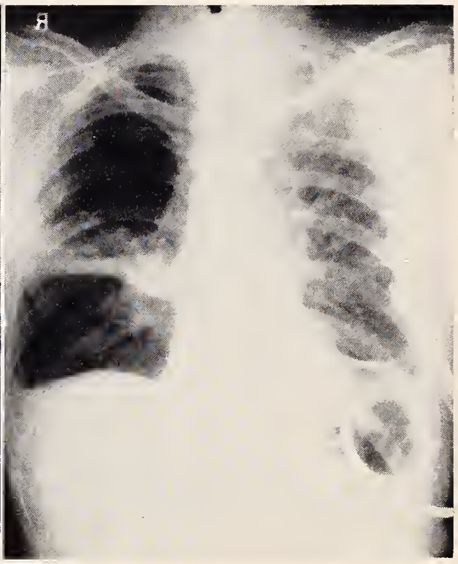


Fig. 9. (*left*) Case 6. Preoperative chest film in a case of giant bullous emphysema. Note the bilateral giant bullae occupying the upper lung fields with smaller bullae in the lower lobes. Note also the compressed pulmonary parenchyma below the large bullae on the left.

Fig. 10. (*right*) Case 6. Postoperative chest x-ray on December 1, 1949, showing left side well expanded after excision of several large bullae. The air-containing bullae on the right side have enlarged, probably due to coughing and straining postoperatively.

As air travel becomes more common we should be familiar with the effects of altitude on air in confined spaces, such as occurs in large pulmonary blebs or spontaneous pneumothorax. At 17,000

URINARY ACETONE—ITS DETECTION AND VALUE IN TREATING AMBULATORY DIABETICS

BURTIS J. MEARS, M.D.
Saint Paul, Minnesota

IN diabetes mellitus the body cannot adequately use its carbohydrates and so turns to fat as a source of energy. Fats, *per se,* cannot be used by the body. They must first be broken down by the liver to the ketone bodies, namely, acetone, diacetic acid and betaoxybutyric acid. The muscles readily use these acids but their capacity to do so is limited. If the ketone bodies are formed faster than they can be utilized by the muscles, acidosis results and the ketone bodies are excreted in the urine, giving an objective sign of acidosis.[2,4]

This acidosis with ketonuria is found in various clinical states such as wasting diseases, strict reducing diets and starvation, diarrhea, et cetera. The acidosis in these conditions has the same etiology as in diabetic acidosis, namely, the formation of ketone bodies from fats faster than the muscles can use them.

With the finding of both sugar and ketone bodies in the urine, a diagnosis of diabetes can be made, because with the benign causes of glycosuria, such as lactosuria and renal glycosuria, acidosis does not occur. Of course, not all patients with diabetes are in acidosis. In a few exceptional circumstances ketonuria and glycosuria can occur without diabetes. For example, starvation, as seen in vomiting and diarrhea, will call for an excess breakdown of fats causing ketonuria, and then when the body is therapeutically flooded with intravenous glucose, glycosuria will also be present. Severe liver disease with malnutrition, faulty glycogen storage, and decreased carbohydrates tolerance, could show ketonuria and the oral intake of carbohydrates could cause a temporary hyperglycemia and glycosuria. Patients on self-imposed, strict reducing diets may develop a temporary diminished carbohydrate tolerance along with increased fat catabolism. Ketonuria will be present, and here again, glycosuria may become apparent after carbohydrate ingestion.

Testing for acetone in the urine by the Rothera method rather than looking for diacetic acid is done by this author because acetone appears first in acidosis and disappears last as the condition is corrected, and is technically easier to detect. A possible criticism of the Rothera test is that it is so delicate that it will show faint traces of acetone before true acidosis occurs, but in this state of affairs, the trace of acetone is a warning against imminent acidosis. It must be remembered that in renal insufficiency, so often seen in the older diabetic, the excretion of the ketone bodies is impaired, and acidosis may exist with a negative or weakly positive test.

The Rothera Test.—To approximately 5 c.c. of urine in a test tube is added about 1 gm. of Reagent I (5 gm. sodium nitroprusside and 200 gm. dry ammonium sulfate, pulverized and mixed).

Reagent II (concentrated ammonia) is carefully layered on top of the urine. A purple ring developing in a few seconds at the junction of the two layers indicates the presence of acetone.[6]

A test so simple and valuable as this should be routine whenever sugar is found in the urine.

Although the present accepted definition of diabetic coma usually depends upon the ascertaining of the level of the carbon dioxide-combining power of the blood, diabetic acidosis can easily be defined as being present whenever acetone in any amount above a trace is found in the urine of a diabetic. Diabetic acidosis is no longer thought to be due to dietary indiscretions but rather due to one of the following conditions: (1) insufficient insulin, (2) infection, (3) trauma either accidental or surgical, (4) hyperthyroidism, or (5) pregnancy.

Whenever the ambulatory diabetic showing a strongly positive Rothera test presents himself for treatment, the decision of hospitalization must first be made. Flushing of the face, dyspnea, hyperventilation, dulling of the sensorium, anorexia and vomiting are all ominous signs and should suggest the necessity of immediate hospitalization.

If ambulatory treatment is undertaken, the following procedures and instructions are suggested:

1. Treat the cause of acidosis, keeping in mind the etiological factors: insufficient insulin, infec-

---

Read at the annual meeting of the Southern Minnesota Medical Association, Mankato, Minnesota, September 11, 1950.

tion, trauma, and the decreased sugar tolerance of pregnancy and hyperthyroidism.

2. Force fluids. There is nearly always some degree of dehydration in acidosis.

3. Adequate carbohydrate intake. In severe diabetic acidosis treated in the hospital where repeated blood sugars are available, much evidence is in favor of withholding sugar for at least twelve hours or until a blood sugar level has started to drop.[1,5] In the acidotic patient treated at home, adequate insulin always carries the danger of a sudden hypoglycemia. A large glucose intake, although perhaps prolonging the hyperglycemia and glycosuria, does not materially prolong the acidosis[3] and is good insurance against hypoglycemia. If there is anorexia or fever, a simple but effective means to insure proper carbohydrates intake is to instruct the patient to drink at least two quarts of fruit juice every twenty-four hours. This amount of juice will give approximately 200 gm. of carbohydrates.

4. Qualitative Benedict's test four times a day.

5. Insulin dosage is adjusted to the amount of sugar found in the urine. All long-acting insulins are stopped until the patient is brought under control. The urine is tested before meals and at bedtime. A dosage of regular insulin is established, depending on the degree of glycosuria and the previous demands of the diabetic. A fairly safe rule is to give the previous dose of insulin four times a day if the Benedict test is 4 plus. Thus a diabetic, who has been fairly well controlled on 25 units of slow acting insulin per day, presenting himself with fever and signs of acidosis, can usually tolerate at least 25 units of insulin four times a day if the glycosuria is 4 plus. As the acidosis is brought under control, the glycosuria will diminish before the acetonuria.

Conclusions

The Rothera test is a simple and delicate test for acetone in the urine. The presence of acetonuria in any great amount signifies an increase in fat catabolism and/or metabolism. In the diabetic, this is the initial step in the production of acidosis.

The rules as to the urine testing four times daily and the adjustment of the insulin dosage to each urine test is not only applicable to the acidosis patient but sometimes is the only method whereby the fragile diabetes of the young, the pregnant and the hyperthyroid can be properly controlled.

A simplified explanation of the etiology of acidosis has been presented.

MODERN TREATMENT FOR PARKINSON'S DISEASE

Modern treatment for the one million victims of Parkinson's Disease in the United States can result in this distressing malady's being well controlled, and often alleviated almost completely, Dr. John C. Button, Jr., chairman of the Medical Advisory Council of the Parkinson's Disease Foundation recently reported.

The disease, which is also known as "shaking palsy," causes progressive paralysis accompanied by uncontrollable trembling. It may be caused by sleeping sickness, influenza, grippe, and in older individuals, hardening of the arteries of the brain.

Dr. Button, who is medical director of the Button Neurological Institute, Orange, N. J., stated that "a large proportion of the public long has been under the mistaken impression that little or nothing can be done for the estimated one million sufferers of Parkinson's Disease in this country. That such a belief is far from the truth is being demonstrated every day in the few institutions where the modern treatment of this condition is properly and adequately given."

The purpose of the Parkinson's Disease Foundation, which is planning to set up units of its national organization in the major cities of the United States, is to provide funds for the treatment of victims of Parkinson's Disease, most of whom have lost their means of livelihood as a result of long continued disability.

The Parkinson's Disease Foundation, which has national headquarters at 744 Broad Street, Newark, N. J., is interested in hearing from individuals and organizations interested in treatment of this disease.

SKIN ALLERGY

Newer Trends in Diagnosis and Therapy

STEPHAN EPSTEIN, M.D.
Marshfield, Wisconsin

SKIN allergy embraces a very wide field. One cannot hope to cover much ground in a brief discussion; therefore, I shall just describe some newer trends in diagnosis and treatment of allergic skin diseases. There are many points which I have to omit, but I have prepared mimeographed lectures on allergic skin diseases which will cover both the points I am discussing here and those we have to miss.*

Like many others, we shall use the terms "dermatitis" or "eczema" only as an over-all classification to denote certain common acute and chronic superficial inflammations of the skin. The terms "eczema" and "dermatitis" are used here interchangeably, although we often reserve the designation of dermatitis for the more acute cases and eczema for the more chronic ones.

Classification

For practical purposes, allergic dermatitis or eczema may be divided on a somewhat pathogenic basis as follows:

1. Atopic dermatitis (neurodermatitis).
2. Contact dermatitis.
3. Infectious eczemas (bacterial, mycotic and other parasitic eczemas), including seborrheic dermatitis.
4. Miscellaneous forms of eczema.

All classifications are arbitrary. Furthermore, very often we encounter a combination of different forms of eczema or one form of eczema may gradually change over into another one. In spite of this, it is important for proper management and evaluation to grasp the principal distinctions between the different forms of eczema and to recognize to which category a case of eczema belongs.

Atopic Dermatitis (Neurodermatitis)

Atopic dermatitis is not just "an allergy." Table I will present the most important contributing pathogenic factors.

TABLE 1. CONTRIBUTING PATHOGENIC FACTORS IN ATOPIC DERMATITIS

1. Atopic sensitivity
2. Other skin sensitivity
    a. Epidermal sensitivity
    b. Infectious sensitization
3. Constitution
    a. Heredity
    b. Neurovascular instability
    c. Personality traits
4. Hormonal factors
    a. Hypothyroidism
    b. Estrogen imbalance
    c. Hormonal deficiency in the male
5. Environmental factors
    a. Psychologic conflicts and emotional upsets
    b. Situations of stress and strain
6. Complications and aggravating factors
    a. Secondary infection
    b. Contact dermatitis
    c. External irritation: mechanical, chemical, actinic, heat, humidity

This is quite a list. No wonder this form of eczema is still our most difficult problem; only a *total* approach, considering *every* angle will give results in more severe cases.

The various forms of atopic dermatitis are skin manifestations of a constitutional disorder which also provides the background for bronchial asthma, hay fever and certain other so-called allergic disturbances. Unfortunately, not much is known about what constitutes this abnormality.

The most common forms of atopic dermatitis are the following:

1. Atopic infantile eczema.[1] *
2. Disseminated atopic dermatitis (neurodermatitis). This form of eczema is observed most often in the adolescent or younger adult, but it may occur at any time of life. It is a dry, chronic eczema which favors the flexor surfaces of the body, especially neck, antecubital and popliteal areas and wrists. In more severe cases, the eczema may also cover the face and scalp or any other part of the body; at times the whole skin may be involved, and we are dealing with a generalized atopic dermatitis. Most common complications are secondary infections. Atopic dermatitis may be accompanied by hayfever, asthma and occasionally by cataracts.
3. Localized atopic dermatitis (lichen simplex chronicus circumscriptus).

From the Department of Dermatology, Marshfield Clinic, Marshfield, Wisconsin, and the Division of Dermatology (director, Dr. H. E. Michelson), University of Minnesota Medical School.

Presented at the annual meeting of the Minnesota State Medical Society, Duluth, Minnesota, June 13, 1950, under the auspices of the American College of Allergists.

*Copies of these lectures on allergic dermatitis, urticaria, and drug eruptions are still available upon request.

*Infantile eczema will *not* be discussed in this paper.

Lichen simplex chronicus circumscriptus is found mostly in nervous, highstrung persons between forty and sixty years of age, but may also occur at other ages, especially around puberty. This condition consists of isolated patches of a chronic dry eczema. Favorite locations are the nape of the neck, vulva and perineal regions in the female, and outer ankles, forearms, scrotum, perineum and anus in the male. Usually only one or a few patches are present. The pruritus is very marked, and the condition may cause discomfort out of all proportion to the objective findings.

4. Moist forms of atopic eczema, especially some cases of "dysidrotic" eczemas of hands and feet, and also some cases of "nummular eczema." The relationship of these forms of eczema to the atopic constitution is still controversial.

Allergic Concept of Atopic Dermatitis

Atopic dermatitis embraces those forms of dermatitis that are associated with atopic sensitivity. Atopic sensitivity of the skin, among other things, is characterized by immediate whealing reactions to tests. Immunologically, it is identical with the anaphylactic type of sensitivity. The antigens are usually proteins. Free antibodies often can be demonstrated in the blood stream. The shock organ of anaphylactic sensitivity in the skin is the vascular-connective tissue layer. A dermoepidermal sensitivity apparently also exists in these individuals.[6]

It would be wrong to assume that sensitization phenomena are the only, or even most important factors, in atopic dermatitis.

Role of Allergy in Atopic Dermatitis.—It would be folly to rely on positive skin tests to find the "cause" of atopic eczema. Scratch and intradermal tests may be helpful in regard to environmental allergens. A careful history and analysis of the case will not infrequently indicate some definite sensitivity to house dust, feathers, molds or pollens, or other environmental allergens. Food tests are notoriously unreliable, especially when done as intradermal tests. On the other side, we must always be aware that a negative skin test does not exclude sensitivity to that particular antigen. Some patients with atopic dermatitis are sensitive to human dandruff and human skin.[8] The clinical importance of these observations has not been determined as yet.

Psychogenic Factors

This aspect of atopic dermatitis has been emphasized, perhaps too much, in recent years. Nervous and psychologic factors play an important part in some instances.[5] Many patients with atopic dermatitis are of the hyperactive and of the hyperreactive type. The nervous tension of these patients is usually apparent; many suffer from hyperhydrosis of the hands and feet.

Psychologic problems play a greater role in the severe generalized cases, especially with acute flare-ups involving the face. Often we find those telling "neurotic excoriations." Walsh and Kierland[11] consider the following characteristic emotional patterns most prominent in generalized atopic dermatitis. Suppressed hostility toward the mother or to another supporting figure was present in most of their cases. The skin was apparently utilized in these patients as the site for expressing strong unconscious conflict relating to exhibitionistic tendencies and a frustrated desire for love and affection.

In those patients whose dermatologic reaction had begun in childhood, the emotional disorder appeared deeply rooted in the personality, and striking results from psychotherapy were not obtained. In that group whose dermatitis began as adults, however, with one exception, improvement in the emotional disorder was paralleled by a complete or nearly complete clearing of the dermatologic reaction.

Other cases indicating psychologic conflicts are the circumscribed lichen simplex chronicus. According to Lewis and Cormia,[4] the psyche unconsciously selects any convenient locus minoris resistentiae; the conflicts are expressed by the type of lesions as well as by the localization.

Treatment of Atopic Dermatitis

Treatment has to consider all or some of the following:**

1. Proper topical treatment.
2. Management of pruritus.
3. Allergic factors.
4. Psychologic factors.
5. Endocrine factors.
6. General supportive measures.

Here I shall discuss only a few newer remedies.

**"Management of Allergic Dermatitis" has been discussed by the author recently in Postgraduate Medicine 8:126-130, August, 1950; the reader is referred to this paper.

Antihistamines.—To be frank, the antihistamines have been disappointing. At least they did not live up to expectations. What *can* we expect from them? In urticaria they are very helpful, and the pruritus can be controlled in many instances. However, there are some cases which do not respond. For these it may be necessary to shift from one antihistamine to another. What is the preferred antihistamine? I do not know. At present I still favor Pyribenzamine or Neoantergan during the day, and Benadryl at night. If these fail, then I prescribe an antihistamine of a different constitution, one of the newer piperazine compounds, such as Perazil or Di-Paralene. These latter drugs have a long-acting effect. In atopic dermatitis and in those cases of contact dermatitis which are connected with swelling and severe itching, we also use antihistamines. They relieve the pruritus more or less. Sometimes but only sometimes, they are very helpful, especially in the acute flare-ups of atopic dermatitis and in poison ivy dermatitis. They do not affect the course of the dermatitis, but the pruritus can be suppressed almost completely in some instances. In severe cases, the parenteral use of antihistamines is often more effective. We use Histadyl 20 to 30 mg. twice or three times a day intramuscularly, or Benadryl 30 to 50 mg. intravenously twice a day. The latter should be injected very slowly. It should not be used in hypertensive patients. The efficacy of these drugs is not entirely due to their "antihistaminic" effect. Many of the antihistamines have also an anesthetic, sedative and antispastic action.

Antihistaminic Ointments.—The antihistaminic ointments are a welcome and helpful addition to the topical treatment of certain itching dermatoses. However, these ointments are used too indiscriminately and often in the wrong place. It is important to know *when* and *for what condition* to use them. They are helpful mostly in chronic pruritus ani and vulvae and in those patches of dry eczema which we dermatologists call lichen simplex chronicus. There are a few more occasions where they may help, such as, an itchy subsiding atopic or contact dermatitis, drug eruptions, insect bites. Do *not* use them in an acute or weeping dermatitis.

Which anthistaminic ointments are preferred? There are numerous such preparations available, and many more on trial. I do not believe there is too much difference between them. Ointments with Histadyl, Trimeton, Thephorin, Benadryl and Pyribenzamine seem to work equally well. I have also had experience with two newer preparations which are not yet available commercially—Perazil cream and Chlorotrimeton cream. Both are well tolerated and compare favorably with other antihistaminic ointments.

There is one drawback to all antihistaminic ointments. Sensitivity to them occurs not infrequently, perhaps as high as 5 per cent in some instances. We must become aware of the danger of sensitization and warn the patient to stop treatment at the first sign of irritation. Otherwise the patient may not realize that he has become allergic to the ointment, because antihistaminics, as well as other anesthetic ointments, often still afford some relief from pruritus even after the patient has become sensitized.

ACTH and Cortisone.—Other new drugs of promise in the treatment of allergic dermatitis are ACTH (adrenocorticotropic hormone) and Cortisone. They are, at times, quite effective in atopic dermatitis and exfoliative dermatitis, and also chronic urticaria. However, the effect in these conditions usually is not as prompt and dramatic as in rheumatoid arthritis or in asthma.

Desensitization in Atopic Dermatitis.—Desensitization in atopic dermatitis is still a controversial subject. It certainly should not be a routine measure, but in persistent, long-standing cases of generalized atopic dermatitis and also in some instances of lichen simplex chronicus, cautious desensitization with a house dust extract is at times very beneficial. In recent years I have preferred a mixture which includes also barn dust, molds, bacterial and fungus antigens. Naturally if there are other known, specific environmental allergens such as ragweed, desensitization may be tried with these alone or in addition to the general mixture. Desensitization in atopic dermatitis is at least as difficult and unpredictable as in asthma. Proper dosage can be established only by experience; customarily we start with a 1:1,000,000 or 1:10,000,000 dilution. At times this must be diluted even more. An overdose is usually recognized by itching and an acute flareup within twenty-four hours after the injection. This is always an indication to reduce the dose to at least one-fourth or even less of the preceding one.

Overdosage may produce severe and long-lasting aggravations.

Contact Dermatitis

Contact dermatitis is usually caused by external contacts with what we call simple chemicals. We distinguish between *toxic* (nonallergic) and *allergic* contact dermatitis.

Toxic contact dermatitis is more often encountered in industrial dermatitis where the use of strong chemicals, solvents, cleaners and abrasives may lead to such an occurrence. In nonindustrial cases, contact dermatitis is usually of the allergic type, although there are also numerous nonallergic contributing factors.

Allergic Contact Dermatitis

Although the allergic nature of this form of contact dermatitis has been recognized for a long time, the mechanism is still not fully understood. Contact dermatitis is provoked by so-called simple chemicals such as inorganic compounds or anilin dyes, in contrast to the highly complex protein allergens encountered in atopic diseases. Apparently the actual antigen is a combination of a simple chemical with a protein. The "simple chemical" is called a hapten. This term denotes that small molecular portion of an antigen which confers upon it its immunologic specificity. The protein used for this combination is probably one of the body's own proteins, but in some instances is perhaps derived from the bacterial flora of the skin.

The complexity of modern life brings all of us in more contact with chemicals that are potentially sensitizers. There are always new sources of sensitization; some produce a rather typical picture.

Contact dermatitis from nylon stockings produces a rather characteristic picture of a weeping dermatitis behind the knees and in front of the ankles. The rest of the leg usually does not show any signs of inflammation, or only a mild dermatitis is present.

Sensitization to DDT appears to be rare when one considers the widespread use of insect sprays containing this chemical. Hollander[3] reports a very acute dermatitis of the exposed parts from this source. I have observed a few cases of dermatitis from such insect sprays. They presented a less severe dermatitis of face and neck, combined with a papular itching eruption of arms and legs.

Dermatitis of the feet is too often considered dermatophytosis or "athlete's foot." Contact dermatitis from shoes and stockings is not infrequent. A sharp borderline of the dermatitis above the ankle is very suggestive.

Furthermore, in contact dermatitis of the feet, the webs between the toes are usually spared in contradistinction to dermatophytosis.

Nail polish, as a source of contact dermatitis, has been recognized for many years but still is often overlooked by the physician. Nail polish dermatitis usually occurs in patches of a more chronic eczema. Preferred locations are the eyelids, the cheeks and the neck. Practically never is it seen on the fingers.

A new source of "cosmetic dermatitis" has been recognized by Furman, Fisher and Leider.[2] Rubber pads or sponges used to apply face powder apparently are a rather frequent cause of contact dermatitis of the face in young women.

Another contact dermatitis very important in the Midwestern area is contact dermatitis from weeds, especially ragweed. This dermatitis covers the exposed areas—face, arms and legs around the ankles; in severe cases the whole body may be afflicted. In many instances the dermatitis persists more or less all year around, because the patient is often a farmer and contacts weed infested grain or feed all the time. Even so, there is usually an aggravation from the end of August to the end of September.

In this form of ragweed dermatitis, the patient is allergic to the *oleoresins* of the plant and not to the protein fraction. Therefore, scratch tests and intradermal tests are negative, but a patch test with the plant or the pollens or an oleoresin extract from the weed produces a dermatitis.

It is important to recognize the etiology of this dermatitis, because the patient can be helped only by avoidance of contact, or by desensitization.

That brings us to the question of desensitization in contact dermatitis. Theoretically, it can be done, but it is practical only in plant dermatitis especially from poison ivy or from weeds. How much can we expect? Not the impossible. If a farmer is highly sensitive to ragweed, the chances are we will not be able to desensitize him to such a degree that he will be able to continue as a farmer during the ragweed season. If his

TABLE II. DIAGNOSIS OF INFECTIOUS ECZEMA

History.—An eruption preceded, complicated or flared-up by infection is suggestive.
Suggestive Morphologic Criteria.—Signs of infection. Sharply outlined lesions, especially with round and polycyclic borders.
Bacteriologic Diagnosis.—Smears and cultures are difficult to evaluate because of the ubiquity of staphylococci and streptococci. Negative results are not convincing either, as they may be due to existing allergy.
Skin Tests.—Severe delayed reactions to bacterial antigens are suggestive, especially when provoking flare-ups.
Focus of Infection.—Suggestive.

degree of sensitivity is less, then it may be possible to raise his level of tolerance to such an extent that he can continue most of his chores if he is careful to stay away from threshing and all excessive exposure to ragweed. How about poison ivy dermatitis? Prophylactically, parenteral or oral desensitization is helpful in many cases, but never give injections of a poison ivy extract during the acute phase of the dermatitis.

Infectious Eczemas

It is only recently that we have recognized, or rather rediscovered, the great role of infectious factors in eczemas. In a general way we may say that an infectious eczema is due to a combination of an infection and an eczema. This association may occur in several ways.

The causative bacteria in infectious eczemas are mainly staphylococcus aureus and streptococcus hemolyticus. However, Escherichia coli, the proteus, the pyocyaneus, and the diphtheria bacillus, as well as others, may also cause infectious eczemas.

The diagnostic criteria of infectious eczema are presented in Table II.

The most common forms of infectious eczema are perhaps the following:

1. Infectious eczematoid dermatitis; this means an acute weeping dermatitis around an infection of the skin, a draining sinus or following an infected injury.
2. Infectious eczema of the ears and behind the ears. In this case, the infection may develop secondarily to a contact dermatitis from metal bows of glasses, or to a seborrheic dermatitis.
3. Infectious eczema of the lower legs, originating from a stasis dermatitis, a varicose ulcer or a lichen simplex chronicus, with or without "id"-like generalized eruption.
4. Infectious eczemas of the hands.
5. Infected contact dermatitis.
6. Infected infantile eczema.

Table III shows the main sources of infection.

TABLE III. SOURCE OF INFECTION

Local Infection (skin)	*Focal Infection or Infestation*
Furuncle	Teeth, tonsils
Draining abscess	Gallbladder
Draining ear	Phlebitis
Impetigo	Respiratory tract
Intertrigo	Gastrointestinal tract
Paronychia	Cervix
Angular stomatitis	Prostate
Dermatophytosis	Monilia infection of the vagina
Moniliasis	Monilia infestation of intestines

The principles governing the treatment of infectious eczema are outlined in Table IV.

TABLE IV. TREATMENT OF INFECTIOUS ECZEMA

1. Evaluation of factors.
2. Local treatment of infection and eczema.
3. Systemic treatment of infection.
4. Correction of contributing factors.
   (Contact sensitivities, food or environmental allergies, anemia, impaired circulation, diabetes.)
5. Supportive treatment.
   (Vitamins, liver extract, proteins, ultraviolet irradiation.)
6. Psychosomatic approach.
7. Removal of foci of infection.
8. Desensitization.
9. Non-specific therapy.

The detailed treatment of infectious eczemas has been outlined in another paper (see footnote on Page 38). Here I shall present only an evaluation of certain antibiotic and antiseptic ointments (Tables V and VI).

TABLE V. ANTIBIOTIC OINTMENTS

Antibiotic	*Recommendation*	*Reason*
Penicillin	Do not use.	Danger of sensitization
Tyrothricin	In less severe infections.	Not a very potent antibiotic, but rarely sensitizing.
Streptomycin	In selected resistant cases (e.g., otitis externa).	Usually inferior to bacitracin and aureomycin. Danger of sensitization.
Bacitracin	*Method of choice.*	Potent antibiotic, low sensitizing potential.
Aureomycin	Most potent antibiotic ointment; but: be Careful!	Sensitization index not yet established.

TABLE VI. ANTISEPTIC OINTMENTS

Antiseptic	*Evaluation*	*Remarks*
Ammoniated mercury 3% to 5%	Efficient and clean.	Watch for sensitivity.
Chloresium ointment	Efficient but messy.	Usually well tolerated.
Furacin	Good antiseptic, staining.	Do not use in eczema; potent sensitizer
Rivanol 0.5% to 1%	Good antiseptic, staining.	Watch for sensitivity during treatment.
Vioform 1% to 3%	Good antiseptic, slightly staining.	Usually well tolerated in eczemas.
Sulfonamides 5% to 10%	At times very efficacious.	Use with greatest care. Potent sensitizers. Sulfadiazine least dangerous.

Apply antiseptic ointment only to *local area* of infection, not to Id-like generalized eruption.
Remember: All antiseptics are sensitizers.

From these last tables it may appear that I am stressing unduly the danger of sensitization. But this is not the case. Patients with infectious eczemas are much more prone than others to develop sensitivities to drugs, especially to ointments. All antiseptics are sensitizers, some more than others.

Drug Sensitivity

Whenever a patient with an infectious, or any other, eczema develops a generalized eruption or an aggravation, think of drug sensitivity.

The most important therapeutic measure is immediate cessation of the suspected medication. Symptomatic treatment should be given both externally and, especially, internally. What to do depends on the symptoms. In a contact dermatitis we start treatment with wet compresses and mild lotions. In most other drug eruptions there is little need for external treatment except in the presence of marked pruritus. In this case we use an antipruritic lotion as follows:

Calmitol 5%
Zinc oxide 10%
Calamine lotion q.s.

or an antihistaminic, or at times an anesthetic ointment.

Fluids should be given freely in most drug eruptions. Laxatives, especially salines, are indicated. Antihistamines are frequently of help in relieving the pruritus. If oral medication fails, we use Benadryl intravenously, or Histadyl intramuscularly.

Desensitization to drugs is not used very widely because most drugs can be avoided. However, in some instances, desensitization is indicated and effective, especially in cases of sensitivity to antibiotics such as penicillin and streptomycin. This applies especially to physicians and nurses who have become sensitized and cannot avoid contact with these antibiotics.

Treatment of Serum Sickness Type of Reaction.—This condition is often rather distressing. The patient has a more or less rough time for five to seven days, then recovers usually rapidly and spontaneously. Antihistamines are usually only helpful in relieving the pruritus, but do not have much effect on the course of the condition otherwise. My favorite medication is calcium gluconate intravenously, 10 to 20 c.c. twice a day, given very slowly.

The intravenous use of procaine, (1 gram in 1,000 c.c. of normal saline) has been very helpful in cases of serum sickness.[10] However, this procedure is not completely harmless; especially in a drug eruption one should think twice before injecting 1 gram of another drug. Furthermore, the fear that intravenous procaine would be contraindicated in serum sickness from procaine penicillin cannot be dismissed completely. It is true that the overwhelming majority of patients who have become sensitized to procaine penicillin are sensitive to penicillin only, and not to procaine, but occasionally the patient is sensitized to the procaine fraction. In such a case an intravenous injection of procaine would be very dangerous. Recently, Schiff and Schiff[7] reported an anaphylactic reaction following repeated injections of intravenous procaine.

Prevention of Drug Eruption.—As long as we have to use drugs, we cannot help causing drug eruptions. But there are certain things we can do to lower the incidence of these reactions.

1. Whenever possible, use drugs that have a low sensitizing potential. For instance, avoid penicillin preparations suspended in oil and beeswax. Reactions from these mixtures occur about twice as often as when aqueous suspensions are used.

2. Do not use a relatively dangerous drug such as gold, or sulfonamides, if more harmless drugs are available.

3. Warn your patient about the possibility of the development of drug sensitivity so that he may stop the drug immediately when symptoms appear.

4. Sometimes reactions from insulin or liver extract can be prevented when antihistamines are given before or with the injection. S. Wm. Simon[9] reduced the number of penicillin reactions by mixing penicillin with Decapryn: 100,000 units of crystalline potassium penicillin G were dissolved in 1 c.c. saline solution which contained 5 mg. of Decapryn Succinate.

Once a patient has developed a drug reaction, the following suggestions may prevent it from turning into a more serious condition:

1. The drug must be stopped at once, and one must make sure that the patient does not take a single additional dose of that particular drug.

(Continued on Page 46)

BASIC FACTS ABOUT GALL-BLADDER SURGERY FOR GENERAL PHYSICIANS

DAVID P. ANDERSON, M.D., F.A.C.S.
Austin, Minnesota

An address entitled "Surgery of the Gall Bladder" was delivered at the second annual meeting of this society on August 3, 1893, by Dr. W. J. Mayo of Rochester. In 1899, Dr. Mayo again talked before the society on the subject of gall-bladder surgery, and his presentation was discussed by Dr. J. B. Murphy of Chicago. Dr. Mayo's observations on surgery of the gall bladder and bile ducts in 1899 were published in the *Annals of Surgery* of that year.[4] It is of interest to note that as early as 1899 he had performed the new operation of cholecystectomy four times and that he had successfully accomplished a cholecystoenterostomy with the use of a Murphy button. These early accomplishments, all of which were apparently presented before this society, were climaxed by Dr. Mayo's classical report in 1903 of 311 operations for benign gall-bladder disease with an astounding mortality of only 2.5 per cent.[3] Cholecystectomy was performed thirty-three times with only one death, and thirty-one operations for common duct stone were reported with only one death.

Since these early days of gall-bladder surgery, cholecystectomy has proved to be a highly successful operation, as Dr. Mayo so correctly predicted. We now know that cholecystectomy, with or without choledochostomy, when performed for colic due to gallstones, is followed by a very high percentage of satisfactory results. However, all too many failures still occur following biliary tract surgery. Some failures, or incomplete relief of symptoms, may be attributed to irreparable damage to the liver and bile ducts because of neglected, long-standing disease prior to operation. Other unsatisfactory results after operation on the gall bladder and bile ducts are the direct responsibility of the physician, and are too often due to the lack of application of proven basic facts in selecting patients for the operation and in making certain that the operative procedure answers all of the problems that may be present.

Whether or not he does his own gall-bladder surgery, the general physician must assume responsibility for the success or failure of the surgical treatment of biliary tract disease. He has the first opportunity to see the patient, often during the significant acute colic, and the best chance to evaluate properly the symptoms and clinical findings. He is the one who advises surgery. If his judgment is poor but his advice followed, many unsatisfactory results will attend. He frequently performs his own surgery or selects the attending surgeon, and, in so doing, is directly or indirectly responsible for any technical surgical failures. It is thus essential that the general physician be thoroughly acquainted with the basic rules to be followed in selecting and preparing patients for gall-bladder surgery, and he must have at least a good idea of what constitutes a safe and adequate operation.

TABLE I. BENIGN DISEASE OF THE BILIARY TRACT, ACUTE AND CHRONIC

Operations	Number	Hospital Deaths	Mortality %
Cholecystostomy	7	..	..
Cholecystectomy	149	1	0.7
Cholecystectomy and choledochostomy	55	3	5.5
Choledochostomy	9	..	..
Total	220	4	1.8

It is our purpose today to discuss certain basic facts about surgery of the gall bladder and bile ducts that must be understood if we hope to continue to improve our results. As a background for this discussion, we have reviewed our own biliary tract surgery. This review, for the sake of completeness, includes all operations wherein the biliary tract was either directly or indirectly involved.

Statistical Data

As shown in Table I, we have performed 220 operations for acute and chronic benign disease of the biliary tract with four deaths. This mortality rate of 1.8 per cent is reasonably satisfactory, but we believe that it can and should be reduced. Reports from the Mayo Clinic[5] and the Lahey Clinic[1] record operative mortality rates of slightly less than 1 per cent in surgery of benign biliary tract disease.

Read at the annual meeting of the Southern Minnesota Medical Association, Mankato, Minnesota, September 11, 1950.

TABLE II. SUMMARY OF HOSPITAL DEATHS IN OPERATIONS FOR BENIGN BILIARY TRACT DISEASE

Patient Sex-Age	Diagnosis	Operation	Complications	Interval
G.N. M-83	Acute cholecystitis; perforation of gall bladder and duodenum; peritonitis; choledocholithiasis with obstructive jaundice	Choledocholithiotomy; cholecystectomy, and closure of duodenal perforation	Wound disruption (healed); broncho-pneumonia	27 days
K.K. F-73	Chronic calculous cholecystitis and choledocholithiasis without jaundice	Cholecystectomy and choledocholithiotomy	Acute coronary occlusion	24 hours
J.W. F-60	Chronic calculous cholecystitis and choledocholithiasis with obstructive jaundice	Cholecystectomy and choledocholithiotomy	Residual common duct stone; suppurative cholangitis	6 weeks
A.K. F-42	Chronic calculous cholecystitis	Cholecystectomy	Massive pulmonary embolus	8 days

A summary of the four postoperative deaths in our series is shown in Table II and is self-explanatory. Suffice it to say that the following additions or corrections now have been made in our technique in the hope of reducing postoperative deaths: (1) controlled anticoagulant therapy with dicumarol is used routinely; (2) exploration of the common duct is routinely accompanied by dilatation of the ampulla of Vater with Bakes dilators, and if there is any question of its patency, the ampulla is explored through a transduodenal incision; and (3) no compromise is made for the sake of speed or convenience in our routine closure of abdominal incisions with stainless steel wire sutures.

TABLE III. OPERATIONS FOR BENIGN BILIARY TRACT DISEASE INCIDENTAL TO OTHER LESIONS

Operation	Number	Hospital Deaths
Subtotal gastrectomy (ulcer); cholecystectomy	2	..
Subtotal gastrectomy (Ca); cholecystectomy	1	..
Subtotal gastrectomy (ulcer); cholecystostomy	1	..
Subtotal gastrectomy (ulcer); choledochostomy	1	1
Subtotal gastrectomy (Ca); cholecystectomy and choledochostomy	1	1
Total gastrectomy and colectomy (Ca); cholecystostomy	1	..
Ileocolectomy (Ca); cholecystectomy	1	..
Incarcerated diaphragmatic hernia; cholecystectomy	1	..
Total	9	2

TABLE IV. SUMMARY OF HOSPITAL DEATHS IN OPERATIONS FOR BENIGN BILIARY TRACT DISEASE INCIDENTAL TO OTHER LESIONS

Patient Sex-Age	Diagnosis	Operation	Complications	Interval
P.G. F-77	Carcinoma of stomach; chronic cholelithiasis with cholecsystoduodenal fistula and complete stricture of the ampulla Vater	Subtotal gastrectomy; cholecystectomy with excision of cholecystoduodenal fistula and stomach en bloc; choledochostomy and division of ampulla stricture	Uremia	5 days
J.L. M-32	Chronic duodenal ulcer with massive hemorrhage; common duct obstruction with jaundice, inflammatory, due to proximity of ulcer to the ampulla Vater	Subtotal gastrectomy and choledochostomy	Massive pulmonary embolus; small, localized left subphrenic abscess	10 days

A summary of operations on the gall bladder and bile ducts incidentally performed, either electively or from necessity, during the course of other operations is shown in Table III. The two postoperative deaths in this small series are summarized in Table IV. It can readily be seen that the deaths were not attributable to the biliary tract surgery and that this additional surgical procedure constituted a very necessary part of the total operation.

TABLE V. OPERATIONS FOR MALIGNANT DISEASE OF THE BILIARY TRACT AND PANCREAS

Operation	Number	Hospital Deaths
Cholecystectomy, choledochostomy and partial hepatectomy (Carcinoma of gall bladder)	1	..
Choledochojejunostomy (Carcinoma of pancreas)	1	..
Choledochostomy (Intraductal carcinoma)	3	1
Radical pancreatico-duodenal resection (Carcinoma of ampulla Vater)	2	2
Total	7	3

On seven occasions we have encountered primary malignant disease of the biliary tract or pancreas. The operations performed are shown in Table V, and the three postoperative deaths in this group are summarized in Table VI.

We have operated upon three patients, all children, with traumatic rupture of the liver and bile ducts. All recovered after varying periods of drainage from the resulting biliary fistulae.

TABLE VI. SUMMARY OF HOSPITAL DEATHS IN OPERATIONS FOR MALIGNANT DISEASE OF THE BILIARY TRACT

Patient Sex-Age	Diagnosis	Operations	Complications	Interval
L.J. F-51	Metastatic carcinoma of liver; primary site; intraductal or pancreas	Exploration and choledochostomy	Carcinomatosis	5 weeks
W.S. F-63	Adenocarcinoma of ampulla Vater	Radical pancreatico-duodenal resection	Re-admitted with late jejunal obstruction due to internal pancreatic fistula	2½ months
R.K. M-63	Adenocarcinoma of ampulla Vater	Radical pancreatico-duodenal resection	Uremia and hepatic insufficiency due to intraductal liver metastases	19 days

Selection of Patients for Gall-bladder Surgery

The most important single factor in improving the results of surgery of the gall bladder and bile ducts is the proper selection of patients for operation. Cattel[2] has shown that patients who have continuing symptoms after cholecystectomy frequently have some other lesion that had been present at the time the cholecystectomy was performed. He states, "The good results are largely dependent upon the care with which these patients are selected for operations, in order to make certain that one is operating upon a patient with symptoms relievable by removal of the gall bladder."

We believe that operations on the gall bladder should be restricted to those patients with gallstones. This does not mean that we can always make an accurate preoperative diagnosis, or that we do not occasionally remove a diseased noncalculous gall bladder. It does mean, however, that we do not advocate surgery for the patient with dyspepsia, vague distress and food intolerances, with x-ray evidence of nothing more than a "poorly functioning" gall-bladder.

The patient with acute cholecystitis or typical acute gallstone colic will almost invariably receive relief from an adequate gall-bladder operation. All such patients should be treated surgically if they are reasonable operative risks. Evidence of gallstones by x-ray is sought in elective cases, and persistent non-filling of the gall bladder on cholecystogram, in a patient with a good history of gall-bladder colic, is taken as presumptive evidence of calculous disease. Preferably all elective patients, but particularly those with atypical symptoms, with or without x-ray evidence of gallstones, should be investigated thoroughly before a decision is made to operate. If this is not done, we will invariably overlook small duodenal ulcers, hiatal herniations and numerous other lesions which may simulate gall-bladder disease.

Selection of Gall-bladder Operations

We must not only select patients for gall-bladder operation but we must perform the type of operation that is best for the particular needs of the patient. It is undeniably true that cholecystectomy is an excellent operation, but the surgeon who treats all gall-bladder disease by cholecystectomy alone is doomed to many failures. In addition to being adequate, the operation must also be safe.

Cholecystostomy is a safe operation, as Dr. W. J. Mayo demonstrated in 1903. However, it is not followed by complete relief of symptoms in a high enough percentage of patients to justify its use except for poor-risk patients or whenever the usual anatomical landmarks are obscured by an inflammatory process. We employed cholecystostomy in approximately 3 per cent of the operations in this series, and with increasing experience we are using it less and less.

Cholecystectomy alone is a satisfactory operation when the disease process is limited to the gall bladder. It is a safe operation, provided the surgeon avoids the pitfalls that lead to technical failures. A careful anatomical dissection under direct vision is probably the best assurance of a safe cholecystectomy. We always clearly expose the common duct and the hepatic duct as well as the cystic and hepatic arteries. We believe that the cystic duct should be ligated flush with the common duct and opened for exploration if necessary, in order to avoid the rare but distressing complication of a retained cystic duct stone. We carefully peritonealize the gall-bladder fossa, using a 0000 chromic suture, and interpose omentum, if necessary, in order to prevent adherence of the pylorus and duodenum to the gall-bladder fossa.

Choledochostomy, usually with cholecystectomy, is a very essential part of the surgeon's armamentarium in treating biliary tract disease. It is now generally recognized that about 15 per cent of patients operated for gallstones will also have stones in the common duct, and that the common duct must be explored in one-third to one-half of all gall-bladder operations in order to avoid overlooking silent common duct stones. In our series we explored the common duct in approximately one-third of the operations for benign disease. Stones were found within the duct in about one-half of the patients explored.

The indications for exploration of the common duct have been repeatedly outlined in the surgical literature by various authorities. The procedure *per se* adds very little to the morbidity of the cholecystectomy, and the gratifying results obtained when "silent" stones and other lesions of the common duct are detected and treated fully justify its frequent use. We have found the graduated Bakes dilators safe and satisfactory for completing the exploration of the common duct and dilating the ampulla of Vater. When one has passed a 7 or 8 mm. dilator through the ampulla, he is much more confident that no residual stones remain within the duct and that any small fragments or debris will readily pass through the ampulla.

When it is difficult or impossible to pass a probe or dilator through the ampulla of Vater, we explore the ampulla through a transduodenal incision. This is often the only way that one can definitely diagnose an impacted stone at the ampulla, a fibrosis of the ampulla, or, rarely, a malignancy of the lower end of the common duct.

Conclusions

We have discussed some of the basic facts about gall-bladder surgery that must be kept in mind if we hope to continue to improve our results. We have especially emphasized the fact that we should almost invariably restrict operations on the gall bladder to patients with gallstones, and in elective cases a thorough preoperative investigation is advisable to detect co-existing lesions which, if untreated, will continue to cause symptoms. The operative procedure selected should be conducted safely and must answer all of the problems that may be present.

SKIN ALLERGY

(Continued from Page 42)

The best way to make certain is to tell the patient to refuse further drugs, because he may otherwise receive one or two more doses before the "stop order" on the hospital order sheet is actually carried out.

2. When the patient has become sensitized to drugs, we ought to tell him what he is sensitive to, so that he can avoid taking this drug in the future. Those patients who have been alerted about them are best protected against drug eruptions or their serious consequences.

The physician who develops consciousness of drug eruptions will be of great help to his patients and will save himself a lot of grief.

All in all, we have not made too much progress in recent years in the management of allergic skin diseases. But we have a better knowledge of many underlying factors which makes treatment of these perplexing conditions a somewhat easier job.

NATIONAL PROGRAM IN REHABILITATION MUST BE EXPANDED

FRANK H. KRUSEN, M.D.
Rochester, Minnesota

PHYSICAL MEDICINE and rehabilitation are combined today. The American Medical Association now has a Council on Physical Medicine and Rehabilitation. In 1949 it established a permanent Section on Physical Medicine and Rehabilitation. Furthermore there is now an American Board of Physical Medicine and Rehabilitation which qualifies physicians in this new medical specialty.

Physical medicine and rehabilitation includes the employment of physical therapy, occupational therapy, psychosocial adjustment and vocational retraining in an attempt to achieve maximal function and adjustment of the handicapped or disabled individual and to prepare him physically, mentally, socially and vocationally for the fullest possible life compatible with his abilities and disabilities.

There is extreme need for expansion of the national program in rehabilitation.

In 1949, a group of more than 800 medical and community leaders, meeting in Washington, concluded that, "To accomplish planned convalescence and rehabilitation for those partly disabled by chronic disease, we need increased understanding among physicians and others serving the chronically ill and aged of the possibilities and techniques of rehabilitation, and an increased number of trained rehabilitation, medical and supporting personnel."

They estimated that to staff an adequate system of rehabilitation facilities in this country it would be necessary to recruit and train 2,500 to 3,000 medical specialists and 10,000 to 12,000 more physical therapy and occupational therapy technical workers, as well as several times this number of additional non-medical rehabilitation personnel such as vocation rehabilitation counselors and social service workers.

They concluded further that "Each year about 250,000 men and women are so disabled by injury or disease that they become incapable of holding a job or of enjoying a normal life"; that "altogether there are many million handicapped people in the United States today"; and that "surveys have indicated that 1,500,000 of them—not including veterans disabled in service—would benefit greatly from rehabilitation services."

To provide services, teaching and research in rehabilitation for this enormous number of handicapped persons offers a tremendous challenge to our voluntary health agencies.

Our national leaders have urged extension of rehabilitation programs.

The number of civilian casualties far exceeds the number of war casualties. Some 265,000 men were permanently disabled as a result of combat injuries during World War II, but 1,250,000 civilians were permanently disabled by accidents alone in the corresponding four years.

"The investments in rehabilitation is an investment in the greatest and most valuable of our possessions, the conservation of human resources." This was the opinion of Bernard M. Baruch when he founded the Baruch Committee on Physical Medicine in 1944.

It has been my privilege to serve as chairman of the Baruch Committee on Physical Medicine and Rehabilitation and to aid in the establishment of research centers in physical medicine and rehabilitation and training programs for medical specialists in this field. In 1949, when I issued the report of the Baruch committee I was able to say that, "Although the full effect of the research and training of physicians will not be felt for some time, there have been immediate effects in the rehabilitation and medical care of thousands of disabled veterans and even more disabled civilians."

Our voluntary health agencies should provide leadership in rehabilitation.

It is the effective voluntary groups like the Baruch Committee, the American Red Cross, the National Foundation for Infantile Paralysis and the Minnesota Society for Crippled Children and Adults which are providing the inspired leadership in extending aid to the handicapped, unequaled in any other country.

More community rehabilitation services and centers are needed.

A subcommittee of the Baruch Committee pub-

From the Section on Physical Medicine and Rehabilitation, Mayo Clinic, Rochester, Minnesota.

lished a report in 1946 giving a basic blueprint of an ideal community rehabilitation service and center. In the ideal community rehabilitation center, envisioned by the committee, patients would be derived from a number of sources. The committee envisioned a traveling field clinic to provide rehabilitation service in rural areas. This field clinic could send certain patients to the rehabilitation center. Other sources of patients would be physicians, self-reference, social and governmental agencies, industry, labor and the civilian hospital.

The program of physical medicine should include physical therapy, occupational therapy and physical retraining for orthopedic, medical, neurologic and other types of patients. In the psychosocial program actual treatment and adjustment would be provided; and in the program of vocational education there would be provision for vocational guidance and testing, vocational retraining and special educational projects.

Also, the Baruch Committee envisioned the need for a laboratory of research in rehabilitation in conjunction with such a center. There should be a dormitory for patients who are unable to travel.

This type of rehabilitation center provides an active and living program which will combat any tendency toward chronic invalidism. All patients are guided toward self-sufficiency and independence—the more fortunate returned to full employment and those with limited disabilities to selective employment. The more seriously handicapped would be provided at least with the opportunity for self-support through the medium of the sheltered workshop, and the severely handicapped with a homebound program of activities which would help to make them self-sufficient.

Rehabilitation centers based on this plan of the Baruch Committee are beginning to spring up all over the United States. The St. Paul Rehabilitation Center is a link in this important chain. This is a major project of the Minnesota Society for Crippled Children and Adults which obtains its funds through its Easter Seal campaign. The St. Paul Junior League and the Wilder Charity also aid in financing the center. It is therefore a democratic institution which belongs to all of those who contribute to its support on a voluntary basis.

Let me stress here that voluntary health groups must continue to support and extend the national rehabilitation program to all types of disabled persons. Every American citizen should give both financial and moral support to this program and all of us should demand that voluntary health agencies continue their activities unhampered.

If our nation is to be successful in providing adequate facilities for restoration of all our disabled citizens we must double, redouble, and redouble again our pioneering, voluntary programs to provide service to the handicapped; train personnel to care for the disabled; and provide medical research in methods of restoration following disease or injury.

In every rehabilitation program it is imperative that the medical service be integrated with educational training and placement.

The physician must share in the responsibility of rehabilitation from beginning to end, but the responsibility should not be his alone. Many other specially trained persons and interested citizens must join the rehabilitation team.

It is my earnest hope that all who read this will fight for a continuation of the activities of our voluntary health agencies in offering improved rehabilitation services for the sick and disabled.

WORLD HEALTH ORGANIZATION SETTLES QUARANTINE COMPLAINTS

Acting as an International Tribunal in arbitrating disputes between governments on quarantine problems, the World Health Organization has dealt with 40 cases since 1949, WHO records show.

In addition, the WHO Expert Committee on Epidemiology and Quarantine, meeting in Geneva, recently heard and settled two other complaints.

The international disputes arise, WHO has explained, from restrictions that may be imposed by governments on travelers or merchandise, sometimes in excess of the provisions of the various International Sanitary Conventions now in force.

WHO has undertaken the task of unifying and replacing these conflicting conventions by a single set of International Sanitary Regulations which will ensure maximum safety with minimum hindrance to trade and travel.

The new regulations will be submitted to the World Health Assembly (WHO's legislative body) in May, 1951, and will enter into force six months after being approved.

"PAINLESS" MYOCARDIAL INFARCTION

HOMER R. WARNER, M.D.
Minneapolis, Minnesota

TO WILLIAM HEBERDEN[4] should go the credit for recognition of the symptoms of disease of the coronary arteries. In 1818 he wrote:

> "They who are afflicted with it are seized while they are walking (more especially if it be up hill and soon after eating) with a painful and most disagreeable sensation of the breast, which seems as though it would extinguish life if it were to increase or continue; but the moment they stand still, all this uneasiness vanishes. The pain is sometimes situated in the upper part, sometimes in the middle, and sometimes at the bottom of the os sterni, and often more inclined to the left than to the right side. It likewise very frequently extends from the breast to the left arm."

Although 132 years have passed since this was written, this characteristic pain is still the most important and often the only clue one has to the presence of coronary artery disease and the threat of sudden death that it carries.

It wasn't, however, until twenty years ago that our present concept of the mechanism of pain in coronary disease was placed on a sound basis by the work of Keefer and Resnik.[5] This was called the anoxemia theory. Painless myocardial infarction had been described prior to this time, and these authors proposed the following as an explanation: Pain can be absent in myocardial infarction either because the subject is relatively insensitive to pain or because the infarction occurs so slowly, only a few fibers being injured at a time, that the resulting sensation is insufficient to reach the level of consciousness.

The frequency with which painless myocardial infarction occurs varies considerably if one is to believe all that is written on the subject in recent years in medical literature. Boyd and Werblow,[2] in 1937, reported one-third of 125 consecutive cases of "coronary thrombosis" occurred without pain. (This paper was typical of many in which a careful distinction between coronary thrombosis and myocardial infarction was not made, the terms being frequently used interchangeably.) In marked contrast to this, was Kennedy's series of 200 autopsied cases of myocardial infarction from the records of the Peter Bent Brigham Hospital.[6] One hundred forty-two were classified as recent, and forty-eight of this group were discarded because an adequate history was not obtained at the time of the infarct. Of the ninety-four remaining, 92 per cent had definite pain, 4 per cent had discomfort only (usually a pressure sensation), and 4 per cent had no pain or discomfort.

A recent report by Behrmann, Hipp, and Heyer[1] supports the conclusion of Kennedy that painless myocardial infarction is relatively rare except under circumstances in which the reason for failure to elicit a history of pain is quite obvious.

A review of 200 consecutive cases of recent myocardial infarction seen from July 1, 1947 to July 1, 1950, at the Minneapolis Veterans Administration Hospital has been carried out with special effort to study the type of pain and the circumstances under which no history of pain at the time of infarction could be elicited.

Many of the patients were not admitted until several weeks after symptoms began. Despite this, an accurate description of the pain could still be elicited as the experience was indelibly impressed on the patient's consciousness in most instances. Included in the study were all cases in which a diagnosis of recent myocardial infarction was established either at autopsy or beyond reasonable doubt by serial electrocardiograms and other clinical criteria. The age distribution is shown in Table I.

TABLE I

Age	*Cases*	*Per Cent*
Under 35	5	2.5
36 to 45	16	8.0
46 to 55	80	40.0
56 to 65	80	40.0
66 to 75	17	8.5
Over 76	2	1.0

Of the 200 cases, 184 (92 per cent) had typical angina, usually described as "crushing," "pressing," "burning," or "severe aching" substernal or precordial pain. The adjective "sharp" was seldom used. In 120 cases, the pain radiated to one

Sponsored by the VA and published with the approval of the Chief Medical Director. The statements and conclusions published are the results of his own study and do not necessarily reflect the opinion or policy of the Veterans Administration.

or both arms or into the neck, and in the rest of this group no radiation was described. Radiation into the lower extremities was not encountered.

In nine cases the pain was not typical, but in all of these but one, the symptoms were suggestive enough of myocardial infarction that the diagnosis was suspected immediately by the admitting physician. The exception was a man with substernal pain which was described as being made worse by his lying on his back, and a mistaken diagnosis of hiatus hernia was made in the admitting room. Others of this "atypical" pain group are listed below:

- "numbness of the left hand accompanied by weakness and dizziness"
- "severe indigestion and shortness of breath"
- "severe sense of fullness in the epigastrium with shortness of breath"
- "aching in the throat with radiation down the left arm"
- "severe pain in the left arm radiating down the forearm"
- "left chest pain described as pleuritic associated with epigastric pressure and vomiting"
- "soreness in the left chest on the day after pneumothorax was initiated"

In the remaining seven cases, there was no mention of pain at the time of the infarct in the admission history. The reason for "no pain" in each of these instances becomes obvious with inspection of Table II in which they are summarized.

Comment

Of course, it cannot be concluded from this series that acute myocardial infarction is never painless in an otherwise healthy individual. One, however, can safely say that it must be quite an unusual occurrence; so unusual in fact, that one need not think too seriously of myocardial infarction in a patient who develops congestive heart failure or an arrhythmia, for instance, unless a history of pain or a suggestive pain equivalent can be elicited. This is obviously not true, however, under circumstances in which pain either could not be appreciated (comatose, under anesthesia, et cetera), or could not be expressed (aphasic) by the patient.

That old myocardial infacts are found at autopsy in patients in whose record no pain has ever been described, is a well-known fact and not at all uncommon. This is best explained by the two factors mentioned by Keefer and Resnik in the report already referred to; namely, the rate with which the infarction takes place, and the patient's threshold for pain. To have an infarct of sufficient size to be recognized clinically occur without exceeding the threshold of pain must be quite rare, unless that threshold has been markedly elevated through the effect of some co-existing pathological state. In this series it did not occur.

Summary

1. Two hundred cases of recent myocardial infarction seen at the Minneapolis Veterans Administration Hospital were reviewed with special reference to the type of pain described when present and the circumstances under which no mention of pain was found in the record.

2. Of these, 92 per cent had classical angina.

3. 4.5 per cent had unusual pain, but still suggestive enough of angina to make myocardial infarction the admitting diagnosis in all but one case.

4. 3.5 per cent of the records contained no mention of pain at the time of infarct, but in all of these instances the failure to elicit a history of pain could be easily accounted for by an associated pathological condition which either elevated the patient's pain threshold or rendered him incapable of manifesting the pain had it existed, or both.

THE PHARMACO-DYNAMIC TREATMENT OF PSYCHONEUROSES BY USE OF CARBON DIOXIDE INHALATIONS

Preliminary Report

C. W. BAARS, M.D.
Minneapolis, Minnesota

IN 1929, Loevenhart et al reported increases in psychic function in various psychotic patients, associated with inhalations of mixtures of carbon dioxide in oxygen. L. J. Meduna of the Illinois Neuropsychiatric Institute at Chicago applied this procedure, though with modified technique, to psychoneurotic and psychosomatic problems.

Meduna conceives of psychoses as disturbances of cortical functions, i.e., of the higher associative functions. The psychoneuroses he considers as disturbances of lower structures of the brain which upset or distort the emotional values of ideas and concepts. He feels that the basic difference between a psychoneurotic and a normal person lies in a "disproportion between excitement and excitability." Because of this disproportion the afflicted individual will develop a low threshold to subnormal stimulation or an unduly strong reaction to normal stimulation.

Anesthesia may be induced through repeated inhalations of carbon dioxide. When given in a mixture of 30 per cent carbon dioxide and 70 per cent oxygen, the former goes into a simple solution in the plasma, while the oxygen, having passed the capillary barrier immediately, gets in a chemical linkage with the hemoglobin. By blocking the utilization of oxygen the carbon dioxide produces a rapidly reversible acidosis (Gibbs et al). The threshold of stimulation of every single nerve cell is increased by the carbon dioxide in direct proportion to the logarithm of the concentration of the carbon dioxide inside and outside the cell membrane. Windle et al showed that the carbon dioxide produces certain unexplained changes in the brain cells which make them stain darker than normal.

Equipment.—The mixture of 30 per cent carbon dioxide and 70 per cent oxygen—obtained in tanks, ready mixed—reaches the patient via a reducing valve and an inhalation mask with a central inhaling-exhaling valve. The reducing valve is equipped with two pressure gauges, one showing the pressure inside of the tank, the other indicating the pressure—in pounds per square inch—actually conveyed to the patient. It is important that the valve between mask and bag is an inhaling-exhaling one, as it prevents the patient from rebreathing into the bag.

Procedure.—During the treatment the patient lies on a bed or treatment table. The assistance of a nurse is not essential. The number of respirations taken by the patient is counted out in a loud tone in order that the patient can hear and remember the last count and so indicate at the end of the treatment the onset of the full anesthesia. At the first treatment it is advisable to give only 20 to 25 respirations. Onset of anesthesia is usually reached after from 10 to 15 respirations, but if consciousness is not lost at the end of the treatment, the number of respirations may be gradually increased during the following sessions.

Depending on the depth of the anesthesia, restoration of consciousness after removal of the mask takes approximately one or two minutes. There are no after-effects to interfere with the patient's immediate dismissal from hospital or office other than a momentary dizziness and occasional "numbness" of the legs.

Preparation of the Patient.—A thorough physical examination should be made with special attention to the respiratory and cardiovascular systems, as active pulmonary tuberculosis, hypertension and organic heart disease are contraindications to this treatment.

Restriction of meals is unnecessary as nausea or vomiting do not occur. Clothing does not have to be removed as there is little or no danger of incontinence. There is no danger of tongue biting, fractures or dislocations.

The patient is given a simple explanation of the nature of his "nervous" trouble and of the nature of the treatment itself. A timid or fearful patient may need reassurance as to the safety of

---

From the Division of Psychiatry, Minneapolis General Hospital, and University of Minnesota Medical School.

the treatment. He is advised to breathe slowly and deeply. In case of panting or rapid breathing, the mask should be removed and the patient instructed again as to the proper respirations. The patient is instructed that he may experience certain dreams, emotions, thoughts or memories or only a dreamless sleep, and he is encouraged to tell all he remembers upon awakening.

In the reported cases every effort was made to avoid any suggestions that might interfere with the objective evaluation of the procedure. For instance, the usual question, "Will this treatment help me, doctor?" was answered with the statement that it was only an experiment and that the result might or might not be gratifying.

Physiological Reactions.—with increasing respirations one distinguishes a definite pattern of reactions in the order mentioned:

1. Subcortical excitation, with increase in respiratory rate, heart rate and blood pressure. Pupils and facial capillaries dilate and perspiration appears. This phase lasts from 6 to 12 respirations.

2. Cortical inhibition (narcosis).

3. Psychomotor and psychosensory excitation, mainly composed of emotional discharges and depending on the patient's personality characteristics.

4. Symptoms of extrapyramidal stimulation, usually appearing around or beyond the thirtieth respiration. Frequently seen are tremors, tetanoid spasms of the hands and fingers, athetoid movements and sometimes Babinsky signs.

5. Signs of decerebrate rigidity. This phase may be reached after 60 to 90 or more respirations and is not observed in ordinary therapeutic sessions.

Number and Duration of Treatments.—Treatments may be given as often as once daily, depending on time available and the need of the patient. Each treatment takes about five or six minutes, including interpersonal orientation before and after administration of the gas.

Improvement may be observed after as few as twenty or as many as 150 treatments. If none is seen after about twenty-five treatments, there is usually little hope of improving the clinical picture by further treatments. The number of respirations during each session will be determined by the degree of response. If no subjective change is reported by the patient, the number of respirations is increased by five for three or four treatments. This may be repeated several times if necessary. The adequate degree of saturation with carbon dioxide can be established usually in about ten to fifteen treatments.

Mode of Action.—Usually four patterns of response may be distinguished:

1. Gradual diminution and disappearance of symptoms without much observable mental reaction.

2. Direct abreaction, with reliving of the pathogenic experiences and discharge of the general and focal tension symptoms.

3. Indirect abreaction, by recalling of a dream with symbolic meaning and which can be analyzed.

4. Spontaneous analysis of forgotten or repressed material, recollected between dreams. Without emotional discharge during the treatments and without dreams, the patient discovers the causal relation of his pathogenic experiences to the actual symptoms.

Indications.—Though the treatment reportedly is ineffective in the obsessive-compulsive neuroses, and gives only transient relief of some psychotic features, good results may be expected in the presence of various psychoneurotic symptoms, expressing either focal tension (spastic colitis, stammering, et cetera) or general tension (anxiety, irritability, et cetera).

Meduna also reports satisfactory results in passive homosexuality and alcoholism.

This treatment was given to twelve patients in the Out-Patient Department of Minneapolis General Hospital. For practical reasons the treatments were limited to three times a week (except Case 4). Five patients refused further treatments after from one to five sessions. Four of them gave as reason that they felt like dying or had other frightening experiences. One gave no reason at all. Two other patients received the treatments at very irregular intervals and showed little or no improvement.

Five patients showed different degrees of improvement.

Case Reports

Case 1.—A twenty-seven-year-old, white, single woman, since January, 1949, had experienced fear, tension, dizzy spells and hostility towards her mother. Clinical impression corresponded with the Rorschach test done in

March, 1949, which indicated a fairly severe anxiety neurosis with some overlay of depression. She received six EST in May, 1949, and showed some improvement. In October, 1949, the symptoms of anxiety returned. She then received a total of forty-six treatments of carbon dioxide inhalations. Anesthesia was usually induced after from 6 to 10 respirations. She usually experienced the same dream in which she saw a big city with many people and much commotion. She began to show subjective improvement with the thirteenth treatment. Her symptoms disappeared gradually during the subsequent weeks. However, at about the thirtieth treatment she felt like slipping back into her previous state. The total number of respirations then was increased to 50, and she again improved rapidly. The Rorschach and Thematic Apperception tests were repeated at the end of the treatments and indicated that she was much less concerned over her unhappiness in the past while her problems did not seem quite as important to her as before. In a letter she wrote me afterwards, she stated: ". . . I feel that the treatments have helped me a lot; I feel more like a person that belongs in this world just like anyone else, but there are still things I don't understand."

Case 2.—A twenty-nine-year-old, single, Mexican woman suffered from phobias, crying spells, guilt-feelings, dizziness, tachycardia, insomnia, et cetera, of at least six months' duration. The clinical impression was that she was suffering from an anxiety neurosis with hysterical features. The Rorschach test indicated adjustment on a rather immature egocentric level, lack of poise and inner security, tendency to be rigid in her thinking, being more of an introvert than an extrovert. She received a total of forty-five treatments. Anesthesia was usually reached between 10 to 20 respirations. Perhaps because of her restricted command of the English language she was never able to tell the contents of her dreams. She began to show definite improvement following the nineteenth treatment, and had no complaints between the twenty-fifth and thirtieth treatments. From there on there was a gradual return of some of her neurotic symptoms, which, however, disappeared again when the number of respirations was stepped up to 50. A repeat Rorschach test at the termination of the treatments still suggested anxiety and hysteria, but she appeared to have more tact in dealing with others, she was more logical in approaching her problems, and she was more extroverted than formerly. Clinically she appeared much improved, her shyness had disappeared, she would look at people when talking to them, she seemed to have more poise and confidence, and her symptoms of anxiety were much less prominent.

Case 3.—A twenty-five-year-old, white, single man had numerous neurotic complaints most of his life. Our clinical impression was anxiety neurosis with early schizoid features. The Rorschach test indicated immaturity with very poor inner control, introspectiveness, anxiety, conflict, tension and marked emotional instability; conclusion: severe maladjustment with prominent signs of hysteria and anxiety. He received a total of twenty-six treatments. Anesthesia was reached only on a very few occasions, in spite of the fact that his respirations were always deep and slow and at times numbered as many as 55. He usually saw colored lights evolving in complicated geometric patterns. Notwithstanding the unexplained absence of anesthesia, the repeat Rorschach test indicated considerable change—the immaturity was much less prominent, he appeared to have much better intellectual control, he was less overly sensitive, he tended to hold back his emotions more without, however, being too rigid. He also seemed to have developed insight into his condition.

Case 4.—A twenty-five-year-old, white, single man was admitted to the hospital with a severe acute anxiety hysteria. Personality study revealed prominent schizoid features. There was a history of epilepsy since childhood. He showed marked improvement with two treatments daily for the first three days and a total of nine treatments within one week. He was readmitted to the hospital several weeks later presenting clinical features of a schizophrenic psychosis, but without symptoms of hysteria or anxiety.

Case 5.—A thirty-four-year-old, white, married man was diagnosed as a depressive reaction in a passive aggressive person with schizoid trends. Due to circumstances the number of treatments had to be limited to twelve. By then he indicated that his depressive features had diminished; he felt more relaxed. He was most impressed with the fact that he had not experienced any craving for alcohol, though he had been a heavy drinker for at least seventeen years. He felt that the treatments were responsible for this.

Judging by the results of these few cases, I feel that the treatment of psychoneuroses by use of inhalations of carbon dioxide deserves a wider experimental trial. It appears that though this treatment may not be able to cure the neuroses, at least it will diminish the morbid emotional response to environmental or other stimuli and favorably influence pathologic reaction patterns, so that additional psychotherapy will be easier and more successful. As this treatment is inexpensive, consumes very little time on the part of the patient as well as on the part of the physician, and is free from any danger, it may be considered as a valuable addition to our therapeutic armamentarium.

TORSION OF THE PEDICLE OF OVARIAN CYSTS

DOUGLAS L. JOHNSON, M.D.
Little Falls, Minnesota

TWISTED ovarian cyst pedicle is a condition which is historically quite common. However, the average practitioner encounters it but a few times during a lifetime of practice.

Testbooks state that torsion is the most important complication of ovarian tumors and that it occurs in 10 to 20 per cent of the cases. Although percentage-wise these figures may be correct, the fact that only five cases were found in the past ten-year period in St. Gabriel's Hospital, a 100-bed general hospital, indicates that its occurence is infrequent. During this same period, the number of major surgical operations of all types was 3,146. Thus, torsion of the pedicle of an ovarian cyst has occurred about every two years in a hospital that averages one major surgical operation daily.

The cause of twisting of the pedicle of an ovarian tumor is not often determined. Since it is a mechanical process, however, there are several mechanical factors involved. First of all the tumor or cyst must be freely movable in order to twist. Typically, this would involve dermoid cysts, fibromas and cystomas. Those tumors which are usually adherent, and therefore not involving a torsion process, are corpus luteum cysts and endometrial or chocolate cysts. Also, an extremely large mass would not be prone to twist, although the cyst may vary from golf ball size to 8 or 10 inches in diameter.

According to some writers, this complication is said to follow some unusual exertion, severe trauma, or a pregnancy that results in increased length of the pedicle. This last factor seems to be recognized as a definite causative agent by several authors.

The symptom complex of twisting of the pedicle of an ovarian cyst, reduced to its simplest terms, consists of an abdominal pain followed by a slowly developing peritonitis. There are of course many variations, depending on the stage of the condition that has been reached.

There is frequently a history of recurrent abdominal pain extending over a period of several weeks or months. These attacks, which are not persistent, are interpreted as slight torsions that correct themselves. In a series of 120 cases reported in England, 119 gave a history of pain previous to the severe attack.

The patient who appears for treatment usually complains of an abdominal pain that may or may not have had a sudden onset. There usually is nausea and vomiting. Usually, if seen early, there will be little or no temperature elevation or leukocytosis. Examination of the abdomen usually reveals a pelvic mass, although bimanual examination may be necessary to reveal it. There is usually acute tenderness over the mass itself, and often over the entire lower abdomen. As the disease progresses, abdominal rigidity, elevated temperature and increased white blood cell count develop.

The symptomatology also varies according to the speed with which torsion occurs, and also with the amount of twisting. The degree of rotation may vary from a few degrees to more than 360 degrees. In one of the cases to be reported later it will be noted that the tumor had rotated fully three complete turns.

The sudden rotation produces an unbearable pain accompanied by other prostrating symptoms and severe shock. The more slowly developing attack may have recurrent pain over a period of a few days, gradually becoming more severe. The severity of the symptoms also increases with the amount of torsion. Usually in an acute rotation there will be some uterine bleeding.

In considering the differential diagnosis, appendicitis looms as the chief possibility. The absence of a mass is probably the chief means of differentiation. Also to be considered are ruptured tubal pregnancy, ruptured ovarian cyst, ureteral stone and strangulated hernia. In each case, careful examination will probably eliminate these other conditions. However, in some cases the diagnosis may not be made until the abdomen is opened.

The pathological effect of the twisting process depends upon the amount of vascular changes created. Partial vascular occlusion with gradual torsion may cause only venous congestion. As the process continues and thrombosis of the

---

Presented at staff meeting of St. Gabriel's Hospital, Little Falls, Minnesota.

veins occurs, the same effects are produced as in a more rapid process. Reaching the advanced stages, this produces gangrene of the ovary, the cyst and usually the tube. The mass appears dark purple or black. Peritoneal irritation may be evident. The thrombosis may extend proximally up along the ovarian pedicle with a predisposition toward postoperative embolism. The treatment of such a pathological process is surgical as soon as the diagnosis can be established. If the diagnosis cannot be immediately made, a period of observation does not significantly increase the risk to the patient. This period will often permit the observer to see the picture develop over a period of a few hours to the point where the diagnosis is definite.

Removal of the cyst usually means the removal of the ovary and tube, since they are usually both involved in the twisting process. The technique of removal consists of double clamping and ligating with peritonealization of the exposed surfaces. Results of surgery are usually excellent, although the operative risk is increased over that of removal of a simple cyst or tumor.

There is some variation of opinion as to whether or not the pedicle should be untwisted before removal. One English surgeon untwists the pedicle and hot packs the cyst. If normal color returns to the ovary and tube, he preserves these structures. A French surgeon untwists the pedicle only when necessary for exteriorization. He maintains that ligation and cutting without untwisting will result in a lower rate of postoperative emboli.

The five following cases illustrate the diagnostic points and some of the errors that may be made in diagnosis.

Case Reports

Case 1.—This twenty-eight-year-old patient was admitted to the hospital November 9, complaining of pain in the lower left abdomen, vomiting, and anorexia. She stated that she had been well until four days prior to admittance, when she was seized with severe abdominal pain, which persisted for two days, but occasionally disappeared entirely. Severe pain returned during sleep the night before admittance. Improvement occurred during the afternoon of the day of admittance. Recurrence of the pain brought her to the hospital during the evening.

The past history revealed that she had had four normal pregnancies. Her youngest child was fourteen months old. An appendectomy had been performed seventeen years previously. Menstrual periods were normal. An episode similar to the present one but milder and lasting three days had occurrd six months previously.

Examination revealed a moderately obese woman, appearing uncomfortable, lying with the legs drawn up, pulse 120, and blood pressure 140/80. A lower abdominal mass was present in the mid-line extending up to the umbilicus or about the size of a six months' pregnancy. It was freely movable and tender. There was also tenderness in the left lower quadrant. Pelvic examination revealed an acute tender mass the size of a five months' pregnancy, somewhat fluctuant, lying mainly to the left of the mid-line.

Diagnostic possibilities considered on admission were: (1) pregnancy with threatened miscarriage, (2) bowel obstruction, (3) left ovarian cyst with torsion of the pedicle.

The white cell count on admittance was 15,500. X-ray examination showed a soft tissue mass probably an ovarian tumor. The temperature was normal on admittance, 99 degrees the following morning, and by that evening had risen to 101.4 degrees. At this time the abdomen was more tender and muscle spasm was appearing. She was taken to the operating room with the diagnosis of ovarian cyst with torsion of the pedicle. It will be noted that this patient presented the typical picture of a pelvic mass and a slowly developing peritonitis.

A large ovarian cyst involving the entire left ovary was found. The pedicle had twisted through an entire 360 degree circle three times. After removal, the tumor measured 5 by 9 inches and weighed 4 pounds and 13 ounces. The walls were thickened by hemorrhage. The postoperative course was uneventful.

Case 2.—This thirty-one-year-old patient was admitted to the hospital January 7, complaining of lower abdominal pain recurring intermittently for a week. On the day of admittance, she had severe abdominal pain starting in the right side with a sudden onset. There was a pregnancy of two months' duration existing.

The patient had pain and tenderness over McBurney's point and right rectus rigidity was elicited. Pelvic examination was not done. Temperature on admission was 100 degrees, white cell count 19,600. Preoperative diagnosis of acute appendicitis or possibly ectopic pregnancy was made.

The patient went to the operating room immediately. The appendix appeared to be normal. Examination of the pelvis revealed a mass of gangrenous tissue in the region of the right tube with a retro-uterine mass about 3 or 4 inches in diameter lying deep in the pelvis. The pedicle was twisted 720 degrees. The tube and ovary were removed with the cyst.

The patient recovered uneventfully and was delivered normally at full term. Pelvic examination might have established the diagnosis preoperatively insofar as the mass was not palpable abdominally.

Case 3.—This patient, forty-six years of age, was admitted to the hospital November 4, having had severe pain in the right lower quadrant of six hours' duration, with nausea, vomiting and a feeling of faintness. There was no history of previous pain. The patient appeared pale and sick and was in great pain. Pulse was 90, blood pressure 102/80.

Examination of the abdomen revealed tenderness deep in the right lower quadrant with some rebound tenderness. White blood cell count was 11,400.

Diagnosis of ovarian cyst with possible torsion was made. The patient was taken to the operating room immediately and a large hemorrhagic cyst was removed. It was filled with blood and was becoming gangrenous. The cyst had twisted one and one-half times on its pedicle. Recovery was complete and uneventful. This patient presented the shock picture of rapid torsion.

Case 4.—This thirty-year-old patient was admitted to the hospital February 21, 1945, with a history of pain in the right lower quadrant starting ten days prior to admittance. This pain had a sudden onset and required repeated use of opiates for relief. The pain had been more or less constant for ten days but was not as severe as when she was admitted. The last menstrual period was January 16. Two days prior to admittance she had severe rectal pain during defecation. On admittance the temperature was 100 degrees, pulse 94. Pelvic examination revealed a hard, tender mass in the left lower quadrant. The uterus was firm and extremely painful to touch. The Friedman test was strongly positive. The white blood cell count was 10,000. A preoperative diagnosis of possible ectopic pregnancy or ovarian cyst was made.

The patient was taken to the operating room, and a large hemorrhagic mass involving the right tube and ovary was found in the cul-de-sac on the right. There were numerous adhesions. The gangrenous mass was not identifiable. However, the opinion of the pathologist was that there was no placental tissue in the mass, and that the diagnosis was a twisted ovarian cyst.

The postoperative course was uneventful. The patient was delivered of a full term infant the following October.

Case 5.—This patient, aged forty-one, was admitted to the hospital on January 9, 1950. She was delivered of a 4-pound, 3-ounce infant spontaneously at 7:00 a.m. on January 10. Twenty-four hours postpartum she developed a distended upper abdomen with repeated emesis of black material. Her pulse rate increased to 160, blood pressure fell to 105/60, white blood cell count 13,000. She had marked sweating, pallor, gray facies, anxious expression and appeared to be in pain. The patient had a temperature of 102 degrees. Pain had a sudden onset.

Diagnosis of bowel obstruction was made, and the possibility of some existing peritonitis was considered. The condition was thought not to be purely a complication of her delivery. Twenty-four hours later, after decompression of the bowel, the patient's general condition seemed to be improved. The white blood cell count dropped in twenty-four hours from 13,000 to 8,600. It was determined, however, that operative interference was necessary to relieve the intestinal obstruction.

At operation a large ovarian cyst with a twisted pedicle was found on the right side. Adhesions from this mass obstructed the ileum about 6 inches from the ileocecal valve. The cyst contained bloody fluid. The right tube was included in the mass that was removed. Recovery was uneventful.

Summary

Five cases have been presented to illustrate the point that in a woman lower abdominal pain with gradually increasing peritonitis and a pelvic mass probably indicate torsion of the pedicle of an ovarian cyst.

NURSING NEEDS INCREASE

Nursing needs have increased in spite of lower death rates, longer life expectancies, and a generally healthier population. The number of people in the United States has increased by an estimated 16,000,000 since the 1940 census. More people are now living to an older age than ever before, and consequently the diseases and disabilities of older people have multiplied. A high standard of living has prevailed since the early years of the war, medical prepayment plans have spread, and public health services have been expanded in many areas. In 1940, 10,087,000 patients were admitted to hospitals in the United States, but by 1948 the number of hospital admissions had risen to 16,422,000.—Pub. Health Reports, August 5, 1949.

LOW-BACK AND SCIATIC PAIN

The Importance of Intraspinal Investigation

HENDRIK J. SVIEN, M.D., and HENRY W. DODGE, JR., M.D.
Rochester, Minnesota

THE RÔLE of protruded lumbar intervertebral disk in the production of low-back and sciatic pain has been emphasized frequently in the literature of the past few years. However, it is well to be reminded periodically that there are numerous causes of low-back and sciatic pain. These can be classified, in general, as follows:

1. Infectious causes: syphilis, typhoid and tuberculous spondylitis, fibrositis, myositis, certain forms of arthritis, herpes zoster, and so forth.
2. Metabolic causes: diabetes, gout, osteoporosis, and so forth.
3. Structural or skeletal causes: congenital deformities such as spina bifida, sacralization of lumbar vertebrae, spondylolisthesis, spondylolysis and similar lesions, hypertrophic changes, and traumatic skeletal lesions.
4. "Peripheral" causes: pelvic tumors, lesions of the hip joint and femur, vascular disorders, and so forth.
5. Diseases of the spinal cord: sclerosis, myelitis.
6. Intraspinal tumors: primary tumors of vertebrae, primary tumors of the spinal cord and its envelopes, and metastatic tumors.
7. Protruded lumbar intervertebral disks.

By means of a carefully elicited history, a thorough physical neurologic and orthopedic examination, and pertinent roentgen-ray survey and laboratory tests, one can generally relegate the case of low-back and sciatic pain under consideration to its proper category. If infectious and metabolic disorders can be ruled out, if skeletal and peripheral causes can be shown to be absent, and if neurologic evidence of disease or tumor of the spinal cord is not present, one logically places the lesion under investigation in the category of protruded lumbar intervertebral disk.

If the patient is suspected of having an "atypical" protruded disk, he will usually be subjected, in addition to the routine study, to further investigation, which will consist of intraspinal studies. These will include spinal puncture with manometric studies, analysis of the spinal fluid and contrast myelography with either air or oil. If oil (pantapaque or lipiodol) is used, the spinal subarachnoid space is examined as high up as the level of the seventh or eighth thoracic vertebra. By these means, the presence or absence of protruded disk can be determined with a high degree of accuracy.

However, if the patient is considered to present the classic or typical syndrome of protruded lumbar intervertebral disk, he may be operated on directly, without intraspinal investigation. Herein lies a serious pitfall concerning which words of warning can justifiably be said. It is not an unusual experience to see a patient who initially presented a "typical" syndrome of protruded disk and who was operated on directly without relief of his pain, but who, on subsequent intraspinal investigation and operation, was found to have a tumor of the spinal cord.

In a recent review of 1,296 consecutive cases of intraspinal operation from the level of the tenth thoracic vertebra down, it was noted that 1,242 operations were carried out for removal of protruded disks, fifty-one operations were done for removal of spinal cord tumors, and in three cases localized arachnoiditis was found. Due to the disparity in length between the spinal cord and the skeletal axis, some of the nerves which comprise the sciatic nerve leave the spinal cord as high as the level of the tenth or eleventh thoracic vertebra. Involvement of these nerves in the spinal canal anywhere between their point of origin and their exit through their respective intervertebral foramina may give rise to low-back and sciatic pain.

Of the fifty-one tumors of the spinal cord in this series, twenty-four were evident on the initial examination. However, in the remaining twenty-seven instances, the working diagnosis, after the initial history and the general, neurologic, orthopedic and roentgen-ray examinations, was "protruded lumbar intervertebral disk suspect." In all twenty-seven instances, neurologic findings were minimal or absent and roentgenologic sur-

---

Dr. Svien is in The Section on Neurologic Surgery, Mayo Clinic, and Dr. Dodge is a Fellow in Neurosurgery, Mayo Foundation, Rochester, Minnesota.

vey showed only a narrowed interspace, slight scoliosis or hypertrophic changes in some cases. Fifteen of the twenty-seven tumors were situated above the level of the fourth lumbar interspace and would have been missed if only direct exploration of the fourth and fifth lumbar interspaces had been carried out. Also, it is likely that many of the remaining twelve tumors which were situated at or below the level of the fourth lumbar interspace would have been missed if only direct exploration of the fourth and fifth lumbar interspaces were carried out, inasmuch as many of these tumors were intradural and presented no extradural manifestation. Furthermore, many of these tumors which masqueraded as protruded disks were of the type which, if removed early before irreparable damage to the spinal cord and cauda equina had taken place, could be removed completely without neurologic residua.

We have so frequently been impressed with the importance of intraspinal investigation that we employ it in every case in which a protruded disk is suspected, no matter how classic is the case. It is only in this way that spinal cord tumors which mimic faithfully the syndrome of the protruded disk can be identified for what they are. Because tumors situated as high as the level of the tenth thoracic vertebra can produce signs and symptoms indistinguishable from those of the so-called typical protruded lumbar intervertebral disk, it is necessary to examine the spinal subarachnoid space, at the time of myelography, up to the level of the eighth or ninth thoracic vertebra.

SIGNIFICANCE AND MANAGEMENT OF SPONTANEOUS PNEUMOTHORAX

(Continued from Page 34)

feet the volume of air in a given space will double. This may be sufficient to produce severe respiratory embarrassment in an individual carrying a degree of pneumothorax or air in emphysematous bullae which is not disabling at sea level. One of our patients, an Army Reserve fighter pilot, developed a pneumothorax which he carried for several days without seeking benefit of medical advice. On the third day, while waiting in the ready room at the air field preparatory to taking up a single seater fighter plane, he fortunately collapsed and was taken to the hospital where x-rays revealed an extensive pneumothorax. Had the pilot been able to hold out long enough to get his plane to 8,000 or 10,000 feet he would very likely have been the victim of an unexplained plane crash.

In the differential diagnosis the lesion most easily confused with spontaneous pneumothorax is a giant bullous emphysema. These lesions produce the so-called vanishing lung and are seen both in infants and adults. Usually careful examination of the x-ray will reveal other cystic areas as well as a ring of compressed atelectatic lung about the giant bullae. It is important to make the proper diagnosis since aspiration of these giant bullae is indicated only as a life-saving procedure. When the blebs are aspirated and the needle removed, the puncture wound of the bleb will invariably leak air into the pleural space causing a tension pneumothorax.

An example of a giant bullous emphysema from the service of Dr. T. J. Kinsella is shown in Figures 9 and 10 (Case 6).

The author wishes to express his appreciation to Dr. T. J. Kinsella for permission to use Cases 4 and 6 from his St. Mary's Hospital Service.

History of Medicine In Minnesota

MEDICINE AND ITS PRACTITIONERS IN OLMSTED COUNTY PRIOR TO 1900

NORA H. GUTHREY
Rochester, Minnesota

(Continued from the December Issue)

Arthur Foote Kilbourne (1858-1934) was from 1889 until his death medical superintendent and administrator of the Second Minnesota Hospital for Insane (Rochester State Hospital), an honored citizen of Olmsted County and the state.

Descended from colonists who settled at Weatherford, Connecticut, in 1636, Arthur Foote Kilbourne was born at Keokuk, Iowa, on January 5, 1858, the son of Edward Kilbourne and Caroline Amelia Foote Kilbourne, both of whom were natives of Connecticut. The other children of the family were three sisters, Louise B. Kilbourne, Carrie Kilbourne (Kellogg), and Mary Kilbourne (Lyon), and two brothers, Henry W. and Alfred L. Kilbourne.

After receiving his preliminary education in the public schools of Keokuk and reading medicine with Dr. MacDonald, of Keokuk, Arthur F. Kilbourne went east in 1880 to matriculate in the medical department of the University of the City of New York. He was graduated in 1883 with the degree of doctor of medicine and entered at once on a service of nearly two years as an assistant physician at the New York City Hospital for Insane, under Dr. A. E. MacDonald, "the czar of Ward's Island." Late in 1884 he came to St. Peter, Minnesota, as second assistant physician at the Minnesota Hospital for Insane.

During his four years in St. Peter Dr. Kilbourne was an able member of the hospital staff and a member and once an officer of the Nicollet County Medical Society. He was married in St. Peter on October 9, 1888, to Miss Ella Donahower, daughter of Mr. and Mrs. F. A. Donahower of that city.

When, in 1889, an investigation was made of the administration of the Second Minnesota Hospital for Insane at Rochester, changes in staff were made and Dr. Kilbourne, on June 6, was appointed acting superintendent of the hospital. Early in November, on the resignation of Dr. J. E. Bowers *(q.v.)*, Dr. Kilbourne became superintendent; he was the second superintendent of the institution, the seventh appointee to the medical staff.

Able, ethical, progressive, loyal to his profession and unfailingly kind to and in sympathy with patients and associates, for forty-five years, until his death, he worked to bring the hospital, well begun in 1879, to its splendid development. His constant effort was toward the benefit of the patients, in scientific treatment and in comfortable and beautiful surroundings. Even his favorite personal hobby, the raising of superior flocks of purebred White Leghorn poultry, was made part of the common good. In 1889 he sponsored at the hospital a training school for attendants and a training school for nurses, the latter of which long functioned successfully under the management of Dr. R. McE. Phelps, Assistant Superintendent. Dr. Kilbourne was one of the first psychiatrists and hospital executives, in the nineties, to maintain that existing methods of committing patients to state institutions for the insane fostered the unfortunate idea that insanity was a disgrace, and to work for improvement; he always insisted on the use of the word *hospital* instead of *asylum*.

Dr. Kilbourne was licensed in Minnesota under the medical practice act of 1883, receiving certificate No. 1468 (R) on June 22, 1887. He was a member of the Olmsted County Medical Society, and affiliated groups, for forty-five years, and at the time of his death of leading local, state and national medical associations, among them the Southern Minnesota Medical Association (a founder, 1892; its second president, 1893-1894), the Minnesota State Medical Association, the American Medical Association, and the American Psychiatric Association (a life member; its president, 1908-1909); this last society was from 1844 to 1892 the Association of Medical Superintendents of American Institutions for the Insane, and from 1892 until the second change of name, the Medico-Psychological Association.

Interested in social and civic affairs, Dr. Kilbourne was active in Masonic circles, was a Knights Templar, and a member of the Rotary Club. For twenty-five years he served on the Rochester Library Board and as senior warden of the Calvary Episcopal Church of the city.

When Dr. Arthur Foote Kilbourne died at his home on November 30, 1934, in his seventy-seventh year, after a considerable period of failing health, he had given fifty years of distinguished service to the state. High tribute was paid him from many sources as gentleman, scientist and executive. Perhaps the most discerning was the comment, "His outstanding trait was his unfailing kindness and tolerance; he always saw the other person's side of any question."

Dr. Kilbourne was survived by his wife, a daughter and a son. Arthur Donahower Kilbourne died on February 14, 1939, at his mother's home in Evanston, Illinois. In 1942 Mrs. Kilbourne, with her daughter, Miss Katherine Kilbourne, returned to Rochester. Mrs. Kilbourne died in Rochester early in 1947.

Horace F. Kilgore, a homeopathic practitioner, born in 1835, was in Pleasant Grove, Olmsted County, in 1873, according to the *History of Homeopathy* (1880). Other reference to his residence and his activities in the county has not been noted by the writer, and it is believed that his stay was short. On December 31, 1883, when he probably had been resident in Luverne, Rock County, for a considerable time, he received exemption certificate No. 702-3 (H), under the medical practice act of that year. There is record also that prior to 1890 Mrs. H. F. Kilgore, of Luverne, filed an affidavit with the Minnesota State Medical Examining Board that she had been engaged in the practice of medicine in Minnesota before July 1, 1887. The name of Dr. Horace F. Kilgore appeared in the first edition of the directory of the American Medical Association, in 1906; information as to graduation from a medical school had not been available.

Axel N. Knudson, or **Knutson (1826-1899),** born in Ofoten, Norway, came with his wife from Norway to southern Minnesota in 1871 and settled first on a farm three miles from Albert Lea. His professional qualifications are not known; notes about him are included here because he was one of a numerous class of practitioners common in the region in those early years.

Left with an infant daughter at the death of his wife in 1873, he presently remarried. When this marriage ended after twelve years, he began to drift from town to town, and during the next fourteen years he lived in Deborah, Iowa;

in Spring Grove, Houston County, Minnesota; in Mabel, Fillmore County; and in Rock Dell and Rochester, Olmsted County. He sought always his fellow Norwegians, carrying with him his medical equipment in three small chests, and giving "Russian steam baths, cupping, bleeding and medical treatment."

This practitioner spent his last two years as a lodger at the home of Mr. and Mrs. Nels Young, of Rochester, in rooms over the harness shop of Campion and Marrens on Third Street. His death occurred as the result of a fall from the sloping roof of a high shed onto which his room opened. The Rochester press described Dr. Knudson as a recluse who long had led a pathetically lonely life, a deeply religious man and an honest exponent of healing as he knew it. The funeral services were held at the Zion Church, Rock Dell, with burial near by. Halvor Oleson of Rock Dell had been his friend and confidant. It was discovered after Dr. Knudson's death that his only daughter, Mrs. Fred Webber, was living in Austin, Minnesota; she had not heard from her father for twelve years.

Sarah (Mrs. F.) Koontz, who was known in her locality as a "magnetic healer," was born about 1835 and in 1876 or a little earlier she came to Oronoco Township, Olmsted County, from Elkhart, Indiana, with her husband, who was a farmer, and two children, Curtis and Alice. The family home was about three miles south of Oronoco, near Stone's Corners. When he was a young man, Curtis Koontz returned to Elkhart, where he became a railway employe. Alice, who was born in Elkhart in 1861, was married in 1882 to Albert W. Clason, of Oronoco Township, and in the community of her early home spent the remainder of her life. She died on November 14, 1899, under chloroform anesthesia, in a dentist's chair in Rochester. She was survived by her husband, four children, and her brother. Mr. and Mrs. Koontz had died some years earlier.

Mrs. Sarah Koontz on December 31, 1883, under the medical practice act of that year, received state exemption certificate No. 703-3 on giving proof of at least five years' practice of healing in Minnesota.

A reminiscent account has come from an elderly man who was a small boy in Oronoco Township in the eighteen seventies. The Koontz family were good citizens. Many residents within a wide radius had faith in Mrs. Koontz' ability as a healer. "She had a wonderful practice, people really thought that she did a lot of good," and they went to her for relief from various ailments. She would never set a price for her treatments (could not, legally?), but after a patient had consulted her two or three times, perhaps for a cold, she would accept a few dollars. Her procedure of healing was to go into a trance, apparently induced by her stroking her brow with her fingertips, using her arms in rhythmic gestures, snapping her fingers on the completion of each stroke as though casting something from her, and talking always in rhyme. When the trance was established, she would approach the patient, make gestures of stroking the patient's forehead although as a rule not actually touching it, and snapping her fingers. If the sufferer had rheumatism, and many persons in that period did have it, she occasionally would touch lightly the aching region. The afore-mentioned small boy of the seventies was taken to her by his mother over his bitter protest that he did not want to go to "that old fool." He was overwhelmed by consternation when Mrs. Koontz said, during the treatment, "You call me a fool, and I will wind you on a spool and send you to school."

Nathaniel S. Lane (1851-1921) was from 1882 to 1909 a physician of Minnesota; in Eyota, Olmsted County, from 1882 into 1888; in North St. Paul from 1888 into 1894; in Winona from 1894 into 1909.

Born at Paterson, New Jersey, on August 1, 1851, Nathaniel S. Lane was the son of an English father, who was an actor, and a French mother, whose surname was Freeman. He had a sister and a brother, John. After the death of his mother, in her thirties, the boy was abandoned by his father in New York City and became a ward of an orphan asylum. Bound out to a farmer in McHenry County, Illinois, he not long afterward ran away to Chicago and there, with courage and persistence that can only be imagined, he obtained an excellent academic education. All his life he was a worker for improved methods of education, perhaps, his daughter has said, because he had seen so much suffering from lack of education. There is evidence that he first came to Eyota in the middle eighteen seventies, for there is recollection that he read medicine in the village with Dr. A. W. Stinchfield, who settled in Eyota in 1873; probably in this period the young man met the Olmsted County girl he was to marry in 1878.

In 1877 Nathaniel S. Lane received his degree of doctor of medicine from the Chicago Medical College (the Medical Department of Northwestern University) and in the same year began medical practice in Stanton, Nebraska. On October 10, 1878, he was married at Rochester, Minnesota, to Emma Virginia Fulkerson, a daughter of the Reverend J. W. Fulkerson of Willow Brook Farm, near Predmore Village, in the region of Marion and Simpson. Mr. Fulkerson had been sent as a missionary to southern Minnesota in 1856 by the Board of Missions of the United Brethren Church; he was for many years an honored citizen of Olmsted County, as today (1947) his descendants are respected residents of Rochester.

In 1882 Dr. and Mrs. Lane returned from Nebraska to settle in Eyota, Minnesota, where the doctor operated a drug store and followed his profession, during the greater part of his residence of six years in partnership with Dr. Stinchfield. By 1887 he had acquired interests in North St. Paul, notably a drug store in partnership with Howard E. Barto, also of Eyota, and after taking a postgraduate medical course in New York City early in 1888, he removed to North St. Paul in April of that year to enter practice with Dr. Edgar A. Holmes. Dr. Holmes, as noted earlier, had been a boy in Eyota and, like Dr. Lane, had studied medicine with Dr. Stinchfield; he removed to St. Paul in April, 1888, from Oronoco.

After six successful years in North St. Paul Dr. Lane returned to southeastern Minnesota, to Winona; there in November, 1901, he joined a clinical group as a specialist in diseases of the ear, nose and throat, and remained until his health, never good, forced his retirement from practice in 1909. His associates in Winona were outstanding in the medical profession of the state: J. B. McGaughey, E. D. Keyes, Donald B. Pritchard, H. Lichenstein, Oswald Leicht and Hugh F. McGaughey, son of J. B. McGaughey.

Dr. Lane was a member of fraternal organizations, among them the Masonic lodge. He was a founder of the Olmsted County Medical Society, when it was re-established in December, 1885, a member of the Southern Minnesota Medical Association, the Minnesota State Medical Society (from 1886), the American Medical Association and the Winona County Medical Society. His state license, No. 677 (R), issued on January 10, 1884, was filed in Olmsted County on February 21 of that year.

On his retirement from medical practice Dr. Lane, drawn by the climate of the Northwest and the Pacific Coast as favorable to his hobby of horticulture, lived in the West for two years, first in Spokane, Washington, and next in California. From 1911 into 1913 Dr. and Mrs. Lane were in Predmore and Simpson, to care for the venerable Mr. and Mrs. J. W. Fulkerson in their last years. From 1913 into 1916 Dr. and Mrs. Lane were in St. Paul, and in the latter year removed to Evanston, Illinois, to be near their only child, Ruth Lane (Mrs. Edward R.) Ladd. Of ample means, the doctor in Evanston, as elsewhere, engaged in his hobby of raising flowers and fruit; his beautiful gardens still are recalled.

Talented and able, quiet, reserved, and always kind, Dr. Lane is well remembered. He died in Evanston on September 4, 1921, after two years of complete invalidism, the result of a stroke. After her husband's death Mrs. Lane made her home with Mrs. Ladd. Mrs. Lane died on September 12, 1934, and was buried beside her husband in the Evanston Memorial Park Cemetery. Ruth Lane Ladd, a graduate of Northwestern University, has given Dr. Lane's medical diploma to the university's medical department for its archives.

H. H. Lang, according to the *Minnesota, Dakota and Montana State Gazeteer and Business Directory* of 1884-1885, was in Byron, Olmsted County, in that period. Other mention of this physician has not been noted by the writer.

Benjamin F. La Rue was a physician in Eyota, Olmsted County, for about a year from November, 1868, into November, 1869. Although his birthplace and parentage have not been learned, it seems probable, judging from his association with Wabasha County, that he was related to the La Rue family of that region: Professor G. S. La Rue, who in the eighties was a druggist, bookseller and grocer of Plainview, came to Plainview with his parents when he was ten years old. Charles La Rue, of Greenfield, an early settler of the county, came there in 1862.

In Eyota Dr. La Rue had his office in the residence of Mr. B. A. Grubb. When he left Eyota, it was evidently to improve his professional knowledge, for in 1870 he was graduated from Rush Medical College. In that year he began practice in Lake City, Wabasha County, and for the next nine years was in Lake City or in Read's Landing, the latter also on the Mississippi River, near Wabasha.

In notes about a meeting of the Wabasha County Medical Society *(History of Wabasha County,* 1884) held on December 8, 1870, at the office of Dr. Francis H. Milligan, of Wabasha, mention was made of two new names, F. Lessing and B. F. La Rue), on the roster. "The other name [La Rue] new in the record, was the recording secretary. How or when these two joined does not appear, nor when Dr. B. F. La Rue of Lake City was chosen secretary, but they entered by the 'strait gate' for they were not the kind of men to climb up some other way." Dr. La Rue again was elected secretary on January 16, 1872, at a meeting at the office of Dr. Nathaniel F. Tefft, of Plainview.

In 1879 Dr. La Rue removed from Wabasha County and southeastern Minnesota to Appleton, Swift County. He was licensed in Minnesota on November 26, 1883, receiving certificate No. 402 (R). He was listed as at Appleton in successive issues of the directory of the American Medical Association from 1906 to 1916, inclusive.

Joseph Alexander Leonard (1830-1908), although a qualified physician of excellent training and a leading citizen of Rochester, Olmsted County, for fifty years, neither practiced medicine in Minnesota nor used the title "Doctor," it is believed, in this state. A sketch based on detailed accounts of his life is given here because of his long and distinguished career, in which he contributed much to county and state in many positions of responsibility, some of which had to do with medical affairs.

Born on January 24, 1830, at Cambridge, Maryland, Joseph Alexander Leonard was the youngest of the five children of the Reverend William Leonard, member of the Philadelphia Conference of the Methodist Church, and Harriet Laverty Leonard; these parents were natives respectively of Salisbury, Maryland, and Berks County, Pennsylvania. After some years at West Chester and Columbia, Pennsylvania, the family in 1840 removed to Philadelphia, and there Joseph A. Leonard received his early education and worked in a dry goods store and in a book publishing house. When he was seventeen years old he entered the office of Professor James McClintock, lecturer on anatomy and surgery at the Philadelphia Medical College. He was graduated from this college three years later, in 1851, still six months under legal age. Dr. Leonard practiced medicine at Dowagiac, Michigan, until the summer of 1853, when he removed to Whitewater, Wisconsin. In Whitewater he continued practice for a year and a half and began newspaper publication. In December, 1856, with his partner he moved the *Whitewater Gazette* to Waukesha, Wisconsin, and consolidated it with the *Waukesha Plain Dealer,* founding the *Waukesha Republican.* In the spring of 1858 Dr. Leonard went to Madison to serve as clerk of the committee of the state legislature appointed to investigate loans of the state school funds.

In June, 1858, Dr. Leonard arrived in Rochester, Minnesota, and here he studied law under the Hon. M. W. Fay, was admitted to the bar, became Mr. Fay's partner, and in 1859 became county attorney, the first to be elected in the county; under state government the office of county attorney superseded that of district attorney, which had obtained under territorial government. Appointed by President Lincoln, Dr. Leonard was the first Republican postmaster at Rochester. During the Civil War he was appointed by the President a captain of commissary and served from May, 1864, until the close of the war with the First Division of the Sixteenth Army Corps, a command which included four Minnesota Regiments. At the close of hostilities he was stationed at Selma, Alabama, as depot and post commissary; he returned to Rochester in August, 1865, with the brevet rank of major.

In November, 1865, with Walter S. Booth, Dr. Leonard purchased the *Rochester Post* and returned to newspaper editing and publishing. Beginning in January, 1868, he served two terms as president of the Minnesota Editorial Association; in 1868 also he was elected state senator from Olmsted County. In May, 1874, appointed by President U. S. Grant, he became register of the United States Land Office at Jackson, Minnesota, an office which he held until August, 1875. In the latter year he was appointed by Governor Cushman Davis of Minnesota a member of the first board of directors of the Minnesota Inebriate Asylum, at Rochester, and was treasurer of the board until he resigned in 1876; this hospital, as stated elsewhere, before completion of the buildings, and after much argument as to its proper function, became the Second Minnesota Hospital for Insane, which was opened officially on January 1, 1879.

Between July, 1881, and July, 1893, the Honorable Joseph A. Leonard was successively United States consul at Leith, Scotland, two years; consul general at Calcutta, India, three years; and consul general at Shanghai, China, four years. During intervals between assignments he published the *Rochester Post.* From 1896 to 1903 he was probate judge of Olmsted County.

Joseph A. Leonard was married on October 30, 1861, to Kate Cowles, of Rochester. Born in New York on December 19, 1842, Kate Cowles was a daughter of Zalmon John Cowles, a native of Litchfield County, Connecticut, and Sarah Huber Cowles, who was born in New York. Mr. and Mrs. Cowles were married in Geneva, New York, in the late eighteen thirties and came to Olmsted County, Minnesota, in 1858. Their children were Martha, Helen A., Kate, Augustus B., Torris, Sarah V. and Frances Kachicqua. Helen Cowles was married on September 8, 1869, to Dr. Reginald M. Reynolds *(q.v.)*, of Rochester, later of Fergus Falls, and finally of Redlands, California. Frances Kachicqua Cowles became the wife of the Hon. Elmer E. Adams, of Fergus Falls.

An undertaking of the last nine years of Dr. Leonard's life was the gathering and preparation of historical and biographical data toward a local history; Leonard's *History of Olmsted County* appeared in 1910, two years after the death of its chief author, on December 28, 1908. Mrs. Leonard died on January 17, 1909, survived by her two daughters, Miss Maude Leonard, of Rochester, and Mrs. Kate Leonard Kelly, of Chicago.

John Quincy Adams Low (commonly, Quincy A. Low), long in Wabasha County, was for a time in 1873-1874 a physician and surgeon in Rochester, Olmsted County.

Born in Vermont in 1848, John Quincy Adams Low came west with his parents in 1860 to Wiscoy Township, Winona County, Minnesota. The boy spent his early years on the home farm and attended the local school. At seventeen years of age he enlisted, on February 21, 1865, in the Second Minnesota Regiment of Cavalry, from which he was mustered out on November 22, 1865.

On returning home from the service he entered Hamline University, then in Red Wing, Goodhue County, where he completed four years of study. In the next three years he read medicine in the offices of Drs. William H. H. Richardson and Franklin Staples, of Winona, and during this time attended two courses of lectures at the medical department of the University of Michigan. In 1873 he was graduated with the degree of doctor of medicine from the Long Island College Hospital, New York, and at the same time received an addendum diploma for special work in operative surgery.

Although the Rochester residence was not mentioned in the history of Wabasha County (1884), from which a portion of the foregoing was drawn, it is obvious that Dr. Low came to Rochester immediately after graduation. There were occasional newspaper comments on his practice; for instance, that on December 9, 1873, he assisted Dr. Hector Galloway to perform "an operation for hairlip on an infant child whose parents live at Rock Dell."

In January, 1874, Dr. Low removed from Rochester to Wabasha, where he had an office over Jewell's Hardware Store. He was married on January 24, 1875, to Miss C. E. Finch, of Hennepin County. In 1877 he became a member of the Wabasha County Medical Society and for several years served as secretary; he early was admitted to the Minnesota State Medical Society and the American Medical Association. Licensed in Minnesota on November 24, 1883, he received certificate No. 370 (R), which he duly filed in Wabasha County on December 13. Dr. Low was county health officer in 1883, at least, and was a member of the local United States board of pension examiners in the early eighteen nineties.

After more than twenty-five years in Wabasha, Dr. Low removed to a farm home near Crookston, it is said, and there continued his medical practice. On November 15, 1907 the *Journal of the Minnesota State Medical Association and* *the Northwestern Lancet* stated that Dr. Low had removed to California to make his home.

Jesse N. McLane, physician and surgeon, second member (Dr. Martin T. Perrine, the first) of his profession in the frontier settlement of Rochester, Olmsted County, arrived from Indiana in the summer of 1855. Record indicates that for the first few years of his residence he was more active as a city and county officer and promoter of real estate than as a practitioner.

On July 25, 1855, Dr. McLane was appointed the first register of deeds of Olmsted County by Territorial Governor Willis A. Gorman and on October 9, 1855, duly was elected to the office, which he held into 1857. In 1856 he was one of a committee to arrange for the erection of a suitable building for the use of the county officials, and in that year also he was one of a committee to solicit subscriptions to send an agent to Washington, D. C., in the interest of the Root River Valley Railroad. In 1857, the county being without a court house, the courts were held in Morton's Hall, on Main Street, and the meetings of the county commissioners in Dr. McLane's building, a small frame structure, the first of the sort on Broadway, on a portion of the present site of the Cook Hotel Building. In 1861 the doctor was chairman of the supervisors of Rochester Township and that summer was prominent in organizing a great county celebration, in Rochester, of Independence Day. During this early period, it has been said, his residence was a few blocks off Broadway, on Zumbro Street, which then was little more than a footpath.

When Rochester Lodge No. 21 (A.F. and A.M.) was organized in Rochester on August 24, 1857, at Le Sueur Hall, Dr. McLane was one of the charter members and was made Senior Deacon .

The first reference noted to Dr. McLane as a practicing physician appeared in the *Rochester City Post* on July 4, 1863, announcing his professional card elsewhere and describing him as a prudent, skillful and experienced physician; his office and residence were with Lewis McLane on Franklin Street, between College and Second Streets. The card appeared at intervals until in October, 1864, the doctor went to New York City for six months to attend courses of medical lectures. Editorial comment was: "A well-read library during the intervals of an extensive practice and an occasional attendance upon medical lectures are the invariable marks of a reliable and skillful physician, who has already gained and who will maintain a standing in the front ranks of his profession."

In the autumn of 1865 Dr. McLane, genial and highly esteemed citizen, with his family removed to Huntsville, Alabama, thence to Meridian, Mississippi, and next to Pensacola, Florida. Although it has been stated that Florida remained his headquarters, he was in Chattanooga, Tennessee, in 1873 and for a considerable time thereafter as one of a company engaged in the construction of a blast furnace for the manufacture of iron.

John Lewis Martin (1806-1885) was from 1856 to his death, farmer, Wesleyan Methodist minister and actively practicing homeopathic physician in southern Minnesota, successively in Mower, Olmsted and Dodge Counties. He has been mentioned as in Fillmore and Jackson Counties also, but exact record has not been available. Dr. Martin has been described as a small, wiry, bewhiskered man, dignified and respected, who commonly rode on horseback to make his professional calls and to relieve in the pulpits of his brother clergymen.

Born on September 17, 1806, in Madison County, New York (his birthplace sometimes is given as Albany, Albany County, New York) John Lewis Martin was one of a family of seven children whose parents were John L. Martin, from the north of Ireland, a teacher in a school for boys, and Mary Martin, a seamstress, a native of Edinburgh, Scotland. In early adult years he was a clerk in a store. His medical training is unknown; one of his descendants has recalled that he had a medical certificate that had been issued in New York State. Dr. Martin was married in Albany, New York, to Emmeline J. (the name later was changed to Elizabeth Ruth at his request) Berghes, a teacher of music. About 1850 he came with his wife and children to Valparaiso, Indiana, and in 1856, by ox cart, into Mower County, Minnesota, where he farmed in Section 15, Frankford Township, and practiced medicine over a wide surrounding region It is said that he conducted the first neighborhood school of the community in his log house, and that during the diphtheria epidemic of 1866 he rendered valiant service. Mrs. Martin died on December 10, 1870, in her fifty-first year, and was buried in Frankford Cemetery. Still in Frankford in 1874, it is said that during the next two years Dr. Martin and his children were living in or near the village of High Forest, Olmsted County.

For some months in 1876 and early 1877 a Dr. Martin, a homeopath, was in Eyota, Olmsted County, in partnership with Dr. Isaac M. Westfall, and it appears probable that this was Dr. John L. Martin. Dr. Westfall long was a well-known farmer, preacher and practitioner in and near Rochester; his stay in Eyota was short.

In 1877 Dr. Martin settled in Wasioja, Dodge County, so that his children, Fannie, Julia, Fehlena, Amanda, Elizabeth, John, Lewis and Albert (three other children died in infancy) might be educated at the Wasioja seminary. (The seminary, founded by local Free-Will Baptists in 1860, after a few years came under the sponsorship of the Wesleyan Methodist Church. In the course of time the school, as noted elsewhere in this paper, experienced several changes in name as well as a decline in fortune. After the building burned, in 1905, the seminary was not reorganized.)

In Wasioja Dr. Martin engaged in preaching and medical practice. He died in Wasioja, from cardiac disease, on September 22, 1885, and was buried beside his wife in Frankford Cemetery. In 1942 his children were long since dead; several grandchildren and great-grandchildren survived.

St. V. Martinitz, native of Bohemia, was in southern Minnesota in the eighteen seventies and perhaps longer. For a few months in 1874 he was in Owatonna, Steele County. Beginning in August, 1874, the newspapers of Rochester, Olmsted County, published his professional card, "Eclectic physician, office over Central Meat Market. County and city practice," and various notes about his activities. His practice extended as far as Rock Dell to the west and Greenwood Prairie to the east; his hazardous experiences with floods in the Zumbro River and its tributaries, and with storms, were those of his contemporaries.

When in 1878 Dr. Martinitz with his wife spent several months in Europe visiting Bohemia, studying in Vienna, Munich and Paris, his practice was conducted by young Dr. Seth Scott Bishop, newly arrived in Rochester from Fond du Lac, Wisconsin.

In January, 1879, Dr. Martinitz removed from Rochester to Northfield, Rice County. In 1893 a letter came from him, then practicing in Cedar Rapids, Iowa, under the "time act" of that state, informing a Rochester resident that he had been appointed a member of the "Official Council of the World's Congress." In 1896 he was listed in a four state medical directory as of Cedar Rapids; his name did not appear in the first edition (1906) of the directory of the American Medical Association or in later editions.

William Worrall Mayo (1819-1911), one of the earliest physicians and surgeons in the state and in Olmsted County, and his two sons, William James Mayo (1861-1939) and Charles Horace Mayo (1865-1939), all of Rochester, Olmsted County, held a unique position in the practice of medicine in Minnesota. The sons from boyhood received professional training under their father, were graduated each from an excellent medical school of the Middle West and came into practice in the formative period of medicine and surgery when asepsis and antisepsis had been recognized but were not yet established.

William Worrall Mayo was born in the parish of Eccles, near Manchester, England, on May 31, 1819, a son of James Mayo and Ann Bonselle Mayo, who was a daughter of John Bonselle and Tenneson Worrall Bonselle. Members of the Bonselle and Tenneson families crossed to England with the Huguenots fleeing France; the Worralls were a well-established family in Manchester. James Mayo was of the Wiltshire Mayos, among whom were physicians and scientists, who in 1527 came into Lancashire; in his line for generations the names *William* and *James* had been used. When James Mayo died in 1826 his widow removed to the village of Salford, near Manchester, with the six children, Ann, James, William Worrall, Esther, Sarah and Mary.

William W. Mayo received his early education in the schools of Salford. Later he was a special student in chemistry, physics and microscopy under John Dalton, the physicist, in Manchester. He first studied medicine at the Pine Street Medical School in Manchester and later at medical colleges in London and Glasgow. In 1845 he came alone to New York City, where for some months he was employed in the drug room of Bellevue Hospital, and 1846 he began the westward journey from New York by inland waterways that led to Lafayette, Indiana. There, in 1849, after engaging in different occupations, he resumed the study of medicine, under the preceptorship of Dr. Elizur H. Deming. On February 14, 1850, he was graduated from the Indiana Medical College, at La Porte, of whose faculty Dr. Deming was a member, and returned to Lafayette to begin practice. In 1851 Dr. Mayo entered partnership in practice with Dr. Deming and in the following year, an accepted story runs, with Dr. Deming and Dr. William H. Byford attempted to revive the Indiana Medical College, which had closed in 1850; the effort was abandoned when fire destroyed their building and equipment.

On February 1, 1851, William W. Mayo was married at Galene Woods, Michigan, to Louise Abigail Totten Wright. Of Scotch and English descent, Louise Wright was born in Jordan, Onondaga County, New York, on December 23, 1825; an orphan since childhood, she came in 1843 to the home of relatives in Michigan and later to La Porte, Indiana, where she met William W. Mayo. A sturdy, handsome young woman, she was the equal in courage and intelligence of her husband. The first child of the marriage, Horace, died in infancy; a daughter, Gertrude Emily, was born in 1853.

In 1853 Dr. Mayo accompanied Dr. Deming to St. Louis, Missouri, where the older man was joining the faculty of the medical department of the University of Missouri. In St. Louis Dr. Mayo served as unofficial assistant to Dr. John T. Hodgen, the professor of anatomy at the medical school; in the spring of 1854 he applied for and received an ad eundem degree of doctor of medicine from the university, and returned to Lafayette. His increasing distaste for the malarial climate of Indiana, however, soon drove him forth, on an eventful journey to the

Northwest that brought him to Minnesota by way of a Mississippi River packet that he boarded at Galena, Illinois.

Arrived at St. Paul, then a town of about 4,000, he was favorably impressed and at once returned to Indiana for his family. After his home was established in St. Paul, Dr. Mayo in the ensuing two years, eager to learn more of the picturesque new country and to study Indian customs, made various trips on foot and by canoe into the North Shore region of Lake Superior; from the village of Superior he engaged in frontier activities. On appointment by Governor W. A. Gorman he became a commissioner of Superior County (Duluth County) and for some weeks was temporary chairman of the board; with a Mr. Burke he designated a county seat, the site of which now is unknown. As deputy sheriff of Chisago County he took the census in the lake shore region. For the Northwest Exploring Company he visited prospectors to adjudge the worth of their copper claims; and near the present site of Duluth he staked out a homestead claim, which later was jumped.

In the spring of 1856 Dr. Mayo followed the Minnesota River southwest as far as Cronan's Precinct in Nicollet County, near Traverse des Sioux and four miles north of Le Sueur. There his wife joined him and for three years the family lived on a farm that belonged to an uncle of Mrs. Mayo. Although not farming, the doctor allied himself with local agrarian affairs and ever after was concerned in furthering the interests of farmers. In this locality he returned to the practice of his profession, combining practice, as did other pioneer physicians, with incidental occupations to earn a living. Early in 1859 he removed to the village of Le Sueur where with the aid of his brother James, who had emigrated from England a few years earlier, he built a comfortable home for his growing family. Two children had been born in Nicollet County: Sarah Frances, who died in infancy, and Phoebe Louise (1856-1885). In this home* on June 29, 1861, William James Mayo was born.

Because of his ability and his multiple activities Dr. W. W. Mayo by 1861 was known and esteemed over a wide territory as citizen and physician. In August, 1862, when draft boards were established to act on applications for exemption from military service in the Civil War, he became the examining surgeon for Le Sueur County. In that month, when there came the uprising of the Sioux Indians and the siege and battle of New Ulm, Dr. Mayo was one of the physicians who hastened to New Ulm to care for the wounded. When the uprising was over and thirty-eight of the Indian leaders were hanged at Mankato on December 26, 1862, Dr. Mayo came into possession of the body of Cut Nose, a warrior whom he had encountered unpleasantly some years earlier when the chief and two other Indians had accosted the doctor on one of his lonely professional rides and attempted to steal his horse. The skeleton of Cut Nose Dr. Mayo carefully prepared and articulated, and in later years at Rochester he used it to teach his boys Will and Charlie osteology.

---

*In 1932 the house was designated by the Minnesota State Highway Department as a historical site; in 1934 Drs. W. J. and C. H. Mayo presented the property to the village of Le Sueur.

(To be continued in the February issue.)

J. F. Norman, M.D.

President, Minnesota State Medical Association, 1951

President's Letter

January first, this year, is much more than the beginning of a new year; it is the beginning of the second half of the twentieth century. This may mean that we are beginning a new epoch with continued advances in the arts, sciences and techniques of the past fifty years. In the half century just past we have witnessed the most remarkable progress. The Medical Sciences have kept apace with the others, and this new knowledge has been applied to extending man's life with alleviation of much of his suffering. The average citizen lives longer, more comfortably, and he knows that he is protected from the great epidemics which used to decimate mankind. This has been brought about by free medical men, working because they wished to, and not at the behest of a super government which might place the scientist and worker where it wished, and might even order the researcher and the physician to make reports which adhered to the party line.

It was these past fifty years that saw the rise of the clinics which became so great a part of the scientific advancement of the time. The physician in practice also had available the great University Centers, and now the added advantage of having several educational courses brought to his own locality, furnished by the University Center.

Physicians were interested in the scientific advances of their time and also in the art of practicing medicine, which means the getting of this new knowledge to their patients. They were not politically minded enough or well-enough organized to realize that they were being confronted by an entirely new type of propaganda which would take from them the management of their own profession. It was at this point that the American Medical Association made the momentous decision of bringing the facts to the people. It was found that the physicians of the United States were not "too proud to fight." Out of this new policy of the American Medical Association came the publicized campaign which sought to bring to the public the view point of organized medicine. The year 1950 has been a memorable one.

Looking ahead, we hope to see a continued advance in the science and art of caring for the ill. We are justified in expecting great progress, as with free men working without governmental restraint, greater accomplishments than we dreamed of in the past should be ours in the future.

Now, I would express my very great appreciation of the honor you have been so kind as to bestow on me. It will give me great pleasure to have an opportunity to meet many of the men of the state. This will be an inspiration to me as it has been in the past. I shall attempt to perform any task that may come to me. It will be a source of comfort to know that Mr. R. R. Rosell, our Executive Secretary, and others will make smooth the work of the Minnesota State Medical Association, and that Mr. Manley Brist, our legal advisor, will continue to give us his very valuable aid.

I wish to extend to the members of the Minnesota State Medical Association my very best wishes for a very Happy New Year.

J. F. Norman

President, Minnesota State Medical Association

AMA DUES

IT is not surprising that confusion exists in the minds of some of our members as to American Medical Association dues and membership. The following, we believe, is an accurate statement of the present status of the subject.

Membership dues in the Minnesota State Medical Association for 1951 are $30.00; in the AMA $25.00. Both sets of dues were payable with County Society dues to the treasurer of the County Society on January 1, 1951. The AMA membership dues of $25.00 includes a subscription to the *Journal of the American Medical Association.*

In order to be listed as a Fellow of the AMA in 1951, an additional $5.00 is payable to the AMA direct, at 535 N. Dearborn Street, Chicago 10, on receipt of a bill for such dues. A Fellow of the AMA is entitled to attend the scientific meetings of the AMA and to take part in such meetings. He is also privileged as a Fellow to receive one of the specialty journals published by the AMA in place of the *Journal of the American Medical Association.* Only an active member of the AMA may become a Fellow.

Commissioned medical officers of the U. S. Army, Navy, Air Force and Public Health Service, upon nomination by the Surgeon General of the respective service, and the permanent medical officers of the Veterans Administration, who have been nominated by its Chief Medical Director, may become Service Fellows upon approval of the Judicial Council of the AMA. Service Fellows need not be members of a County or State Medical Association nor the AMA, and they do not pay Fellowship dues. They, however, do not receive the *Journal of the American Medical Association* except by payment of the subscription price of $15.00.

If a local County Society regulation permits, a Service Fellow may become an active member of that society and enjoy the same privileges as any other active member.

A regulation which is not generally appreciated is that an active member becomes delinquent if his dues are not paid by December 31 of the year for which dues are prescribed and shall forfeit his active membership in the AMA if he fails to pay the delinquent dues within thirty days after notice of his delinquency has been mailed by the secretary of the AMA to his last known address; also, that members of the AMA who have been dropped from membership for non-payment of dues cannot be reinstated until such indebtedness has been discharged.

Previously, membership in a County Medical Society and State Medical Association automatically meant membership in the AMA. That applied up to 1950—the first year AMA dues were required. Now the rather incongruous situation exists that a physician can be a member of a component County Society and State Medical Association but not of the AMA, which is composed of the State Medical Associations. As representation in the AMA House of Delegates is based on one delegate for every 1,000 AMA members or fraction thereof from each state, the percentage of state members who pay their AMA dues becomes important.

CORTISONE AND ACTH

CORTISONE and ACTH are powerful drugs —atomic-like in action! I recall the lectures at the Mayo Clinic of that philosopher-king, the late Dr. Henry Plummer, on myxedema patients. He would compare the myxedema patient to an automobile deeply mired in the mud. To free the car, he explained, one would have to slowly ease it out of the mud. A quick pull, or the application of an explosive force would liberate the car to be sure, but it would also tear it to pieces with the force. So Doctor Plummer, knowing the myxedema patient was mired in deep physiological stasis due to lack of thyroid substance, would, by the same process of reasoning as in the liberation of a mired car, ease the patient back to the highway of well-being by prescribing small doses of thyroid to start with and, gradually, over weeks and months, increasing the dose until normalcy was achieved.

I have followed the use of Cortisone and ACTH, through excellent reports. Just recently have these drugs become universally available to the medical profession. I have not yet used them. I fear and respect their latent powers. Were I to use them, I would surely follow Doctor Plummer's rule in their administration—small doses over months of time in order to give the mired body an opportunity to ease out of the deplorable condition it is in. One must remember that the majority of conditions for which these drugs are used, have developed over a period of years. To expect to bring about a complete restoration in a few weeks' time is too drastic. Is it any wonder that one encounters serious complications such as mental changes, diabetes, perforated gastric ulcers, skin manifestations of hirsutism, hyperpigmentation, striae atrophica, to say nothing of possible injury to tissues—injuries not observable right away, injuries that may, in time, show up and possibly cause more serious trouble than that with which the patient is already suffering. It seems to me, too little time has passed by to allow these powerful drugs to be used universally. More time and study, especially on more remote effects, should be given. Doctor Plummer's technique in the administration of these drugs should be given a thorough consideration.

These drugs are really ATOMIC in power!

J. J. Heimark, M.D.

PUBLIC RELATIONS

ON DECEMBER 3 and 4, the Third Annual Medical Public Relations Conference was held at the Statler Hotel in Cleveland. Mr. Lawrence W. Rember, secretary to the General Manager, Dr. George F. Lull, and his staff deserve a great deal of credit for having arranged for a most informative meeting addressed by members of the profession from all over the country who had had experience in the various phases of public relations. The meeting was attended by some 340 members of the profession and executives of various county and state medical societies. The attendance demonstrates the interest manifest in the subject. Until two years ago, the AMA laid little emphasis on the many faceted subject of public relations. With the employment of Whitaker and Baxter and the increase in dues to provide for intensive public relations activity, the picture has changed, and the threat of removing medical practice from the domain of private industry has been temporarily averted. There is no reason, however, for members of the medical profession to be complacent or to rest on their oars in approaching the new year or for that matter the years to come. Washington is full of schemers who will submit bills to Congress from time to time with socialism in view.

The establishment of proper public relations between the medical profession and the public cannot be left to the AMA alone. Each state medical association and each county society should have its Public Relations Committee and, fully as important, each individual physician should make it his business to see that his relations with his patients and the public are as they should be. Medical public relations constitute doctor-patient relationship in its many phases. It means providing the best medical care possible to the public at a price they can afford to pay. It means availability of a doctor when he is needed and the elimination of unnecessary operations and medical care. It means taking part in civic affairs and contributing to community chests.

Our profession has been subject to vilification on the part of those who would like to sacrifice the welfare of the public by substituting government medicine for private practice in order to satisfy their political ambitions. Some of the falsifications of certain of these political figures have been answered in an outstanding manner by our national president in 1950, Dr. Elmer L. Henderson of Louisville, Kentucky. The choice of Dr. John W. Cline of San Francisco to head the AMA in 1951 was wise. He has shown himself to be able in word and deed and should be an inspiring leader.

Some minor points were brought out at the Cleveland meeting that local societies might wish to note. In some societies, special meetings are arranged for the new members just embarking on the practice of medicine. Few have had any instruction in medical schools on the economic phase of practice. Indoctrination programs might well include discussion of the matter of fees. Some of the newer members have expressed the opinion that they must charge high fees inasmuch as they have been in the service and the older members of the profession have been reaping a harvest while staying at home. They forget mayhap that there was a World War I. At any rate overcharging is poor public relations. The new mem-

AMA INTERIM SESSION CITES PROGRESS, NEW GOALS

Considered "the finest four-day refresher," the AMA Clinical Session held in December in Cleveland featured reports on progress made in the National Education Campaign, renewed vows for continued efforts to defeat the socialized medicine threat, and set forth toward new goals in medical public relations during 1951. Approximately 5,000 doctors from all over America met at Cleveland to hear speakers and listen to reports of past activities and plans of 1951 programs.

Trustees Vote "Medical Aid" Fund

One of the most dramatic developments came when it was announced to the House of Delegates that the Board of Trustees had voted to provide a "half million dollars out of its National Education Campaign Fund, which was raised to defend medical freedom, for the aid and support of medical schools which are in need of additional financing." The announcement was made by Dr. Louis H. Bauer, chairman of the Board of Trustees, who pointed out that there is growing public awareness that federal subsidy has come to be a burden, not a bounty, for it is bringing intolerable increases in taxation, and "is dangerously increasing federal controls over our institutions and lives of our people."

PRESIDENT PRESENTS KEY VIEWPOINTS

Dr. Elmer L. Henderson, president of AMA, presented to the House of Delegates, several major positions of the AMA. Emphasizing the policy of private aid to medical education, rather than control-producing federal subsidy, Dr. Henderson stated:

> "Many other sources of financial aid to medical education have been overlooked, and the profession's responsibility to assist actively in gaining additional support for the schools has not been fully recognized. Events of the past year have made it clear that there are those who interpret the American Medical Association's opposition to the bills for federal aid to medical education presented before Congress, as indifference to the problems of the medical schools and the needs of the nation for adequate facilities for the training of physicians."

He declared, "We must make it clear that the profession is not indifferent to these problems. Let us face clearly our obligation individually and collectively to provide significant financial assistance to the medical schools and to study other ways by which we can help them meet their problems."

The president explained the splendid work being done with respect to the program of hospital standardization. He cited the meetings of the American Medical Association with the American Hospital Association, the American College of Surgeons and the American College of Physicians, as making real progress toward developing a coöperative program "in which the best interests of the public, the hospitals and the profession will be considered."

Dr. Henderson stressed the continued need for establishment of more public health units throughout the country, stating, "Effective and properly operated public health units is basic to the maintenance and improvement of the health of the people."

Praises Small Business' Aid

Summarizing the AMA's National Education Campaign, Dr. Henderson lauded millions of Americans throughout the nation for their active support of this vital program:

> "That unselfish, spontaneous support came from more than 65,000 individuals, firms and associations, with the vast majority located in the small cities and small towns of America. They represented not 'big business' but the 'grass roots' life of the nation."

Warns of Overconfidence

"The November elections brought defeat to a number of the most outspoken advocates of compulsory health insurance, and also to a number of candidates who hedged on the issue. The elections also provided a general repudiation of the over-all trend toward state socialism," said the AMA president. However, he sounded a note of warning against overconfidence because of these good results:

> "We still have much work to do before all the basic issues confronting us are finally resolved. To relax now, under the delusion that we already have achieved complete victory, would be to invite a renewed attack by the socializers at a later date. We cannot afford to relax either our vigilance or our effort."

WHITAKER AND BAXTER REPORT ON PROGRESS

A full and factual report on the public significance of medicine's advertising campaign was presented by Miss Leone Baxter of Whitaker and Baxter, before the House of Delegates. Miss Baxter related that, "No profession ever has had a more spectacular demonstration of public confidence than that given to American doctors in their nationwide October advertising program. Never before has one profession, business or industry found thousands of unrelated groups, in virtually every area of the country, coming forward in its defense."

Miss Baxter told the delegates that the purpose of the advertising program was to prove that the American public does not want a Government-directed medical system and is with medicine in the battle against compulsion. She said that people in every corner of the country came forward "to state their views, to take their public stand with medicine, and to spend two million dollars of their own money to do it." She commented:

> "This support did not come from 'big business' and 'reactionary interests' as Mr. Oscar Ewing recently proclaimed it would. It came, with real grass roots strength, from tens of thousands of small advertisers along the Main Streets of America—from drug stores, insurance agents, banks, movies, utilities, churches, medical care plans, dry goods stores, hospitals and clinics, restaurants, laundries and plumbers. . . .
>
> "It (the doctors' campaign) has impelled an important segment of the country to declare publicly its confidence in the medical profession and in medicine's ability to meet the medical needs and solve the medical problems of the people."

Rounding out the report, Clem Whitaker, Director, National Education Campaign, summarized the campaign so far and previewed several aspects of the program for the coming year. Discussing progress medicine has made in the past critical years, Whitaker stated that when medicine was on the defensive, some of the tasks which looked hopeless were by-passed and often called for considerable public support which medicine hadn't then achieved. But, he added:

> "Today, American medicine is in the strongest public position it ever has held, because the people have been given the facts on this issue and have spoken out sharply against the abridgement of individual freedom in our country."

Emphasizes Labor's Position

"There *is* enlightened leadership in labor which has no intention of following Washington bureaucrats and socializers down the dead-end street which leads to regimented serfdom," Whitaker averred. He said that winning labor support is one of AMA's important objectives for 1951:

> "The unions have turned against the Communists who infiltrated their ranks—and are throwing out those who are disloyal to America. And now there are the first signs that many in labor are beginning to recognize that State Socialism and Communism are next of kin. That isn't only good news for doctors; that is good news for all America. . . .
>
> "In Camden, Arkansas, during the American Medical Association's nationwide advertising program, the AF of L unions of that community published a full page of supporting advertising, taking public position beside the doctors of their city. That was an impressive indication of the grass roots labor support which medicine can win when doctors take the facts to the members of their local unions."

LABOR MAN SPEAKS FOR DOCTORS' PROGRAM

American doctors attending the Clinical Session heard the stirring talk of a union president, affirming his organization's stand with American medicine against socialization in any form. The speech of William L. Hutcheson, General President, United Brotherhood of Carpenters and Joiners of America, brought these heartening words before the House of Delegates:

> "I am against socialized medicine. So is the organization which I have the honor of heading. . . . This probably does not jibe with the feelings of a good deal of the rest of the labor movement, because much of the pres-

sure for 'free' medical care is coming from labor organizations. But it does reflect my sentiments and the sentiments of our recent convention. . . .

"Saving a dollar has never been distasteful to me. In fact, I like to get as much for my money as the next man. That is one of the reasons why I oppose socialized medicine. It is no bargain. It looks cheap the way the backers present it, but when you dig down under the fancy layer of propaganda frosting you find that it can be mighty expensive. The British people have already discovered that fact."

Mr. Hutcheson cited figures showing that in the wealthier districts of London there is one doctor for 1,261 patients while in the poorer East End the ratio is one doctor to every 2,472 patients. In some of the other boroughs, the average is 2,897. The speaker remarked:

"If that isn't the 'one horse and one rabbit' recipe transferred from the meat pie maker's kitchen to the national health program, then I need new reading glasses. . . . For all the planning that has been done, there is still an uneven distribution of doctors in London. If the backers of the national health program are to achieve their objective of equal health protection for all, the next step must be to tell doctors when and where and how they are to practice. Therein lies my greatest fear of socialization."

Carpenters Want Freedom, Too

Mr. Hutcheson pointed out that carpenters are an independent lot, warning that socialization of medicine or any other industry or business would just as surely bring on socialization of his own profession:

"I do not know much about doctors, but I know quite a bit about carpenters. . . . The first bureaucrat who told a carpenter he had to work in Little Rock when he wanted to work in Lancaster would be gumming his food for lack of teeth. Carpenters want to be free agents; free to work where they want to; free to negotiate the terms of their wages and working conditions through collective bargaining; yes, even free to leave the industry and try their luck at something else if the spirit moves them.

"They will retain these freedoms only so long as all other groups retain them too. Socialization is like a wolf with a tapeworm; once it starts gnawing, it never can stop. Socialized medicine would only be the first bite out of our free enterprise system; it would not be many years before the carpenters would be feeling the teeth of socialization on the seats of their overalls. Anyway you look at it, socialized medicine is no bargain and the carpenters want none of it."

Respects Doctors' Stand

Mr. Hutcheson's union members, speaking through his speech, showed a high regard for medicine's public opposition to the inroads of socialism:

"We in the labor movement have our own cross of regimentation to bear. The fight you are making is part of the same war. It is a war against concentration of authority in a few hands in Washington. As a veteran of forty years in the labor movement, I know what it is to fight for human rights. I am happy to take my stand beside you."

MINNEAPOLIS CHIROPRACTOR PLEADS GUILTY TO PRACTICING MEDICINE WITHOUT A LICENSE

Re: State of Minnesota vs. Earl F. Seeliger

On December 20, 1950, Earl F. Seeliger, thirty-two years of age, a licensed chiropractor with offices at 402 Wesley Temple Bldg., Minneapolis, entered a plea of guilty in the District Court of Hennepin County, to an information charging him with the crime of practicing medicine without a license. Seeliger was sentenced by the Hon. Frank E. Reed, Judge of the District Court, to pay a fine of $200; the fine was paid.

The defendant Seeliger was arrested on December 6, 1950, following an investigation by the Minnesota State Board of Medical Examiners into a complaint made by Mrs. Rudolph Cimbura, 839 Como Avenue, Saint Paul. Mrs. Cimbura stated that she took her ten-year-old son to Seeliger in January, 1950, because the boy was ill. Mrs. Cimbura stated that, following an examination lasting approximately two hours, Seeliger made a diagnosis of influenza. Mrs. Cimbura stated that part of the examination consisted of having the boy hold a device in each hand, the device being attached to a machine by means of wires. Mrs. Cimbura stated that she asked Seeliger if the boy was not suffering from appendicitis. He replied: "No, it is a case of good old 1918 flu." The boy was given chiropractic adjustments on two occasions. Seeliger also prescribed and furnished certain drugs and medicines, notwithstanding the fact that he has only a chiropractic license. Mrs. Cimbura stated that the boy became seriously ill and was removed to a Saint Paul hospital. A doctor of medicine was called, who stated, following an examination, that the boy was suffering from acute appendicitis. The boy was operated upon and subsequently recovered.

Minneapolis Surgical Society

Meeting of May 2, 1950

The President, Ernest R. Anderson, M.D., in the Chair

THE AXILLARY ARTERY AND ITS BRANCHES

Their Variations as They Pertain to Radical Mastectomy

HERBERT W. PETERSON, M.D.
Minneapolis, Minnesota

A thorough knowledge of regional anatomy is one of the outstanding prerequisites which a surgeon must possess in order to complete a surgical procedure satisfactorily. In most instances, a knowledge of the usual anatomical findings is sufficient for carrying out the uncomplicated operation. Variations from the usual should be known in order that the surgical dissection can be facilitated.

Surgery of the breast, in order to be properly and completely expedited, requires a thorough understanding of the anatomical relationships of the axilla and its surrounding structures. This knowledge includes the usual textbook findings as well as the abnormalities which are not always described in a book of anatomy. With this thought in mind, this subject was selected for study and review. In the final analysis, the more meticulously and completely the axillary vessels and their tributaries can be stripped of their covering tissue, together with their adjacent nodes and fat, the better is the prognosis and chance for survival of the patient.

Anatomical abnormalities pertaining particularly to the blood vessels are often encountered. These variations must be accurately recognized in order that a thorough dissection may be performed without accident. Undue trauma incident to a lack of adequate knowledge could be damaging or even disastrous.

Sixty-seven axillas of cadavers were studied in the anatomical laboratory at the University of Minnesota. This study was concerned chiefly with the axillary artery and its first four branches. An attempt was made to determine the exact point of origin of these branches. Obviously, it cannot include all the possible variations from the usual because the series is not sufficiently large. However, it does represent an over-all picture of the common variable findings encountered when radical mastectomy is performed. The veins, although possessing many more branches and ramifications than the arteries, are considered to accompany their respective arteries. They also carry the same terminology. No attempt at description of surgical technique for radical mastectomy is intended. Each surgeon has his own modification of the original Halsted[2] operation. The primary interest of this study is focused upon the blood vessels of the axilla.

American medical literature appears to be rather limited in respect to this phase of the subject. The most comprehensive and enlightening study for comparison was that of Gesselevitsch,[1] a German anatomist, who was concerned mainly with the anastomoses of blood vessels and the collateral circulation in the region of the axilla and shoulder joint. His analysis was based upon the dissection of 176 cadaver axillas, together with nine x-ray examinations of axillary vessels injected with radiopaque materials. It has been interesting to note the general similarity of conclusions arrived at by Gesselevitsch when compared with those of this study.

For purpose of review, the axillary artery is a continuation of the subclavian artery. It begins at the lateral border of the first rib and terminates at the medial margin of the latissimus dorsi muscle. Beyond this its continuation receives the name of brachial artery. The entire axillary vessel measures approximately 5½ inches in length. Anatomists[2,4] usually divide it into three segments depending upon its relationship to the pectoralis minor muscle. The first, or most medial, portion measures about 1 inch in length and extends from the first rib to the medial border of the pectoralis minor muscle. The second division, about ¾ to 1 inch long, lies directly under the pectoralis minor muscle close to the insertion of the latter into the coracoid process of the scapula. This third and longest segment, from 3 to 3½ inches in length, extends from the lateral border of the pectoralis minor muscle to the inner border of the latissimus dorsi muscle.

As you may have noted, very little mention has been made of the fifth and sixth branches, namely, the anterior and the posterior circumflex humeral arteries. The reason for this is that these two vessels are, so to speak, out of bounds in the routine radical mastectomy. They are not often encountered unless they have direct communication in their origins with the subscapular artery. They are, however, very important in the collateral circulation and anastomoses in the event that the axillary artery is inadvertently or otherwise ligated or sectioned.

The axillary vein, although not dealt with directly in

Inaugural thesis.

c. from subclavian	8 times
d. from second port. of ax. (indepen.)	4 times
e. thor. acr. trunk (second port.)	2 times
f. from pect. br. of thor. acr. trunk (cec. pt.)	2 times
(eight times from sec. pt. of ax.)	

TABLE II. VARIATIONS WHICH WERE OBSERVED IN THE THORACOACROMIAL ARTERY

Thoracoacromial Artery (a. thoracoacromialis; acromiothoracic a.; thoracic axis)	
Relation to pectoralis minor m.	
Proximal (med. to)	19 times
Under (post. to)	47 times
Distal (lat. to)	1 time
Variations in type of origin:	
a. forms thor. acr. trunk with lat. thor.	5 times
b. forms thor. acr. trunk with lat. thor. and subscap.	2 times
c. forms thor. acr. trunk with lat. thor. and sup. thor.	1 time
d. from two trunks under pec. minor m.	2 times
e. fan-like trunk up over med. bord. p. min.	11 times
f. gives off lat. thor. as sep. branch	2 times

TABLE III. LATERAL THORACIC ARTERY AND ITS VARIATIONS

Lateral Thoracic Artery (a. thoracalis lat.; long thor. a; ext. mammary a.)	
Relation to pectoralis minor. m.	
Proximal (med. to)	3 times
Under (post. to)	52 times
Distal (lat. to)	12 times
Variations in type of origin:	
a. forms thor. acr. trunk with thor. acr.	5 times
b. forms thor. acr. trunk with thor. acr. and subscap.	2 times
c. forms thor. acr. trunk with thor. acr. and sup. thor.	1 time
d. from common trunk with subscapular	2 times
e. from subscapular	2 times

this discussion, is very important to the dissectionist or surgeon. It becomes the "landmark" in the process of exposing the axilla and its vessels. After sectioning the insertion of the pectoralis minor muscle several salient features present themselves. The axillary vein becomes the first major vessel encountered. It varies considerably in size. In some instances the lateral portion of it is so small that it could easily be mistaken for one of its branches, such as the subscapular vein. It bifurcates early in its second and third portions much more often than does the artery. This may produce unique patterns of branches and anastomoses. Finally, its position is quite inferior to the clavicle, especially in its second and third segments. This should caution one to proceed slowly and carefully while exposing and stripping it of its adjacent tissue.

Comments

There are certain comments to be made as a result of this study which should be helpful to the surgeon in performing radical mastectomy. After severing the insertion of the pectoralis minor muscle and upon opening of the coracoclavicular fascia, the axillary space is, so to speak, unlocked. The axillary vein immediately presents itself with its branches and the corresponding branches from the axillary artery. The vein lies upon and slightly below the axillary artery. It is quite inferior to the clavicle. If the pectoralis minor muscle is further freed by ligating and sectioning of the pectoral branch of the thoracoacromial artery, the axillary vessels become more clearly exposed. As dissection and stripping of the vessels progresses the following findings and variations of each axillary branch from the artery may be anticipated.

The superior thoracic artery is the smallest derivative. It is relatively unimportant and is sacrificed during the removal of the pectoralis major and minor muscles. It is apt to be present 64 per cent and absent 36 per cent of the time. When it is present and identified, it originates from the first portion of the axillary artery, the usual origin, in 59 per cent of cases. It arises from the subclavian artery 18 per cent of the time and from the second segment of the axillary artery 18 per cent of the time. In 5 per cent of dissections it will have some other origin.

Fig. 6. Collateral circulation after ligature of axillary artery.

The thoracoacromial artery, the second largest branch, can be expected to originate from the second portion of the axillary artery in 70 per cent of cases and from the first portion in 28 per cent of cases. It has a common origin with the superior thoracic, the lateral thoracic and the subscapular arteries 13 per cent of the time. It has variations in its manner of origin 22 per cent of the time, but these variations are relatively unimportant.

The lateral thoracic artery ultimately assumes a common course with its corresponding vein and the long thoracic nerve. It is the third largest branch from the axillary artery. It is almost always ligated and sectioned when performing radical mastectomy. It originates from the second portion of the axillary artery 77 per cent of the time. In 18 per cent of dissections it should stem from the third portion and in 5 per cent of dissections from the first part of the axillary artery.

TABLE IV. VARIATIONS IN THE SUBSCAPULAR ARTERY

This artery presented the greatest number of variations.

Subscapular Artery
(a. subscapularis)

Usual findings: single origin from third port. of ax. between lat. border p. min. and lat. dorsi	39 times
Variations:	
a. lat. to med. border of lat. dorsi. m.	5 times
b. from common tr. with lat. thor.	2 times
c. forms th. acr. tr. with th. acr. and lat. thor.	2 times
d. gives off lat. thor.	2 times
e. bif. at origin and gives off th. dor. and cir. scap.	4 times
f. same trunk as ant. and post. circumfl. humeral	5 times
g. gives off ant. circumfl. humeral	2 times
h. gives off post. circumfl. humeral	2 times
i. gives off a. and p. circumfl. humerals	1 time
j. early bif. of ax. with subsc. from radial	1 time
from brachial	2 times

The subscapular artery, in most instances, represents the lateral boundary of the axillary space. From a surgical standpoint it is the most important branch of the axillary artery to be considered during radical mastectomy. It has the greatest number of variations when compared to the others. It can usually be kept intact, but stripping it, its accompanying vein and the thoracodorsal nerve of adherent tissues is imperative. Its usual,

TABLE V. INCIDENTAL OBSERVATIONS

Cephalic Vein	
a. empties into axillary vein	48 times
b. empties into subclavian vein	16 times
c. not accurately determined	3 times
Axillary Vein (relatively large or small)	
a. large	39 times
b. small	28 times
Medial Cord (brachial plexus)	
a. Prominent	18 times
b. Not prominent	49 times

single origin from the last segment of the axillary artery and its subsequent branches into the circumflex scapular and thoracodorsal arteries may be expected in 57 per cent of cases. Eight per cent of the time it courses lateral to the medial border of the latissimus dorsi muscle. In 16 per cent of dissections the subscapular artery gives off the anterior and posterior circumflex humeral arteries either independently or by a common trunk. After an early bifurcation of the axillary artery, in 4.5 per cent of cases the subscapular artery arises from either the brachial or radial arteries. This last possibility is exceedingly important and should always be kept in mind.

The anterior and posterior circumflex humeral arteries are usually considered to be out of the field of dissection during the routine, radical amputation of the breast. However, they may have a common origin with the subscapular artery or an origin from the resulting arteries formed immediately after early bifurcation of the axillary artery in its third portion.

Summary

Sixty-seven axillae of cadavers were dissected, and a study of the axillary artery, its usual branches and their variations from the usual pertaining to radical mastectomy was made. A semischematic drawing of the collateral circulation after ligature of the various segments of the axillary artery has also been presented.

Discussion

Dr. Carl O. Rice.—I have been very much interested in these studies of Dr. Peterson in that I have been following his work throughout the period in which he has been doing them. I am aware that he has conducted a very carefully outlined procedure of dissection.

Radical breast surgery is an anatomical dissection. It is important that the surgeon know the anatomy of the axillary region and its variations in order that he can more confidently carry out the technique of radical mastectomy.

Until one has reached the anatomical region beneath the pectoralis minor muscle, no important structures are endangered. After this area is encountered, it is well to know all of the variations, lest permanent, avoidable damage be done to nerves and blood vessels which may be encountered out of their usual normal relationship.

Dr. Peterson has illustrated the variations of anatomical relationship in this area. It will be interesting to await the publication of this paper in order that his drawings can be studied more extensively. If each of us could spend a small fraction of the time that Dr. Peterson has devoted to this study, we would be well repaid by obtaining a greater knowledge of the anatomy of the axillary region. These variations which Dr. Peterson has described cannot be learned from standard textbooks of anatomy.

I am happy to see Dr. Peterson become a member of our society on the basis of this inaugural thesis.

Dr. C. D. Haagensen, associate professor at Columbia University Medical School, New York, New York, presented a paper entitled "Surgical Technique in Carcinoma of the Breast."

William H. Rucker, M.D.

PUBLIC RELATIONS

(Continued from Page 73)

bers may well be addressed on the various activities of the society by the chairmen of the various society committees on medical ethics, legislative activities, medical economics, voluntary health insurance and public relations. In some societies, the new members are invited several times a year to sit in with the executive committee in its deliberations. In some localities, the members of the local press are invited to dine with the society officers and members of the Public Relations Committee once or more times a year. Personal acquaintanceship leads to better understanding.

It is with a feeling of uncertainty that most of us approach the new year. We can hold ourselves responsible for our public relations as a profession. We pray for Divine guidance for those responsible for the public relations of our nation.

As in the case of other highly infectious diseases, the spread of tuberculosis can only be controlled by the isolation of the patients with active, sputum-positive infection from those who are susceptible to the disease but who have not yet contracted it. This is not being done and cannot be done among the American Indians for whom hospital accommodations are not provided by the Bureau of Indian Affairs and for whom funds are not available to expand the contractual service with non-government-operated sanatoriums—Fred T. Foard, M.D., J.A.M.A., February 4, 1950.

"... it was discovered that Dramamine ... is a powerful preventive of motion sickness."

—Editorial: Dramamine,
GP 2:27 (July) 1950

DRAMAMINE® BRAND OF DIMENHYDRINATE

—for the prevention and/or treatment of motion sickness

For the dizziness, nausea or vomiting caused by motion, Dramamine has given unusually satisfactory results, prophylactically and therapeutically. Supplied in 50 mg. tablets and in liquid form. G. D. Searle & Co., Chicago 80, Illinois.

RESEARCH IN THE SERVICE OF MEDICINE SEARLE

In Memoriam

WILLIAM STANFORD EMMERSON

Dr. William S. Emmerson of Waconia died on April 19, 1950, at the age of seventy-two.

Dr. Emmerson was born at Caesarea, Ontario, April 3, 1878. He obtained his medical education at the University of Minnesota, graduating in 1904. After practicing in Minneapolis a year he moved to Mayer, Minnesota. He was a member of the Scott-Carver County Medical Society, the Minnesota State Medical Association and American Medical Association.

GEORGE H. FREEMAN

Dr. George H. Freeman, superintendent of the State Sanitorium at St. Peter for twenty-three years before his retirement in 1948, died December 2, 1950, at Butte, Montana, at the age of sixty-seven.

Dr. Freeman was born at Perham, Minnesota, January 5, 1884. His medical degree was obtained from the University of Minnesota in 1905 and he interned at Ancker Hospital, Saint Paul. He joined the staff at Saint Peter Sanatorium in 1906 and remained there until 1912 when he became superintendent of the State Sanatorium at Willmar. In 1925 he became superintendent of the sanatorium at Saint Peter.

Dr. Freeman was one of the very first in Minnesota to be certified as a specialist in psychiatry, and many present leaders in the specialty received their training under him. Even after retiring in Minnesota, he continued in the field as superintendent of Montana State Hospital at Warm Springs, Montana.

Dr. Freeman was a member of the Nicollet-LeSeuer County Medical Society, the Minnesota State Medical Association, and the American Medical Association. He was also a member of the American College of Physicians and Surgeons and was a past president of the State Neurological Society.

Dr. Freeman is survived by a son, Dr. John Freeman of Rochester, Minnesota. His wife died in 1946.

A. E. HENSLIN

Dr. A. E. Henslin, a practitioner in Le Roy, Minnesota, for fifty-six years, died on November 25, 1950, at Cresco, Iowa. He was eighty-five years of age.

Dr. Henslin was born June 20, 1865 at Racine, Wisconsin. He obtained his medical education at the College of Physicians and Surgeons at Keokuk, Iowa, graduating in 1891. His internship was served at Trinity Hospital, Milwaukee. He practiced for a short time at Adams before going to Le Roy. He, along with Dr. O. H. Hegge of Austin and Dr. G. J. Schottler of Dexter, had each served his community over fifty years and were honored at a testimonial dinner given by the Mower County Medical Society in 1947.

Dr. Henslin married Mary L. Pinckney in Spring Valley in 1905. She died in 1914. One son, Dr. M. E. Henslin of Cresco, Iowa, survives him, along with two sisters.

Dr. Henslin had been a member, as well as president and treasurer, of the Mower County Medical Society for thirty years. He was automatically a member of the Minnesota State Medical Association and the American Medical Association.

CHARLES B. LENONT

Dr. Charles B. Lenont, a pioneer Mesabi Range physician, passed away November 5, 1950. He was eighty-one years of age.

Dr. Lenont was born at Northfield, Minnesota, September 30, 1869. He graduated from the University of Minnesota medical school in 1898. He practiced medicine at the Soudan Hospital for six months and then worked for two years for Dr. Harwood in the Fayal Hospital at Eveleth.

Early in 1901 Dr. Lenont moved to Virginia and the next year erected the Lenont hospital which he operated until the Virginia Municipal Hospital was opened in 1935. With the opening of this hospital, he formed the Lenont-Peterson Clinic in conjunction with Edward N. Peterson of Eveleth. Dr. Lenont remained in active practice, limiting his work to general and orthopedic surgery until his retirement in 1942.

Dr. Lenont was a fellow in the American College of Surgeons, a member of the St. Louis County Medical Society, the Minnesota State Medical Association, and the American Medical Association.

The various business enterprises which engaged Dr. Lenont's attention included the Dunka River Lumber Company of which he was president, the Stanley Mining Company, and a 1,000 acre farm in the Babbit area for the growing of potatoes.

He was much interested in curling being one of the founders of the Virginia Curling Club. He later established a trust fund to be used in furthering interest in this sport. He was a charter member and past master of the local Order of Masons, and Aad Temple, Duluth, Ancient and Arabic Order of the Nobles of the Mystic Shrine and a member of the Benevolent and Protective Order of the Elks.

In addition to the widow, Dr. Lenont is survived by one son, Stanley of Virginia; three daughters, Mrs. Emerson McNeil of Duluth, Mrs. Cedric Adams of Minneapolis, and Mrs. James Giblin of Virginia; six grandchildren, and one brother, Granville, of Livengood, Alaska.

R. C. RADABAUGH

Dr. R. C. Radabaugh of Hastings, well-known as a Republican leader in the state, died after a brief illness on November 24, 1950, at Mounds Park Hospital, Saint Paul, Minnesota.

"... *in the minds of men...*"

In treating the disorders that exist in the minds of men, psychiatric nursing plays a vital role. Proper care can be given patient's only by properly trained psychiatric nurses.

In view of the present shortage of such trained nurses, and the desperate need for them, the Glenwood Hills Hospitals School of Nursing, Neurology and Psychiatry is appealing to you physicians for aid in solving this problem.

By sending us the name of a promising nursing candidate in your community—a girl aged seventeen or over, with a high school education—you will be doing your part to alleviate this critical nursing shortage.

Our one-year course in psychiatric nursing is tuition-free. Our graduates have an excellent professional career before them.

Please send the name of a potential nursing recruit to

BIRTCHER

BLENDTOME

Portable

Electrosurgical Unit

. . . a MODERN LOW-COST SURGICAL UNIT for all minor and various major surgery.

The Birtcher BLENDTOME is a surprisingly practical unit for office surgery. With this lightweight unit, you have *all* the electrosurgical procedures of major units—electro excision, desiccation, fulguration and coagulation. While not meant to be compared to a large hospital unit, the BLENDTOME has been successfully used in many TUR cases. Such facility indicates the brilliant performance of the BLENDTOME.

ALL 4 BASIC SURGICAL CURRENTS

1. *Tube Generated Cutting Current.*
2. *Spark-Gap Generated Coagulation Current.*
3. *A controlled mixed blend of both above currents on selection.*
4. *Mono-polar Oudin Desiccation-Fulguration Current.*

Never before has a surgical unit of such performance been offered at the low price of the Blendtome.

Write "Blendtome Folder" on your prescription blank or clip your letter head to this advertisement. Reprint of electrosurgical technic mailed free on request. Please indicate your specialty.

R. C. RADABAUGH

(Continued from Page 82)

Dr. Radabaugh was born at Zumbro Falls, Minnesota, March 17, 1890. He attended high school at Rochester, Minnesota, Hamline University, the University of Minnesota and the University of Illinois, where he obtained his medical degree in 1917. After interning at the University Hospital in Chicago, he practiced in Mazeppa, Minnesota, then left his practice to serve as Lieutenant in World War I. Following his return from service, he practiced in Hastings and in Saint Paul.

Dr. Radabaugh was State Republican chairman from 1938 to 1944, leading the G.O.P. organization through three successful Minnesota campaigns. He also managed Stassen's unsuccessful bid for the presidential nomination in 1944.

He was a member of the American College of Surgeons, the Ramsey County Medical Society, the Minnesota State Medical Association, and the American Medical Association. He was also a member of the Dakota lodge, A.F.&A.M., Hastings; the Scottish Rite; Osman Temple of the Shrine, Saint Paul; Acacia fraternity, and the Phi Rho medical fraternity.

Dr. Radabaugh is survived by his wife, Lois, two daughters, Charlotte of Hastings and Virginia (Mrs. Philip Simon) of Los Angeles.

ERNEST L. STEPHAN

Dr. Ernest L. Stephan of Hinckley passed away at his home November 13, 1950.

He was born at Cleveland, Ohio, January 27, 1869, the son of Judge Daniel Stephan of the Supreme Court of Ohio, who was one of the honorary pallbearers at the funeral of Abraham Lincoln.

Dr. Stephan came to Pine County as a boy and attended the schools in Pine City, later serving as County Superintendent of Schools in Pine County. He obtained his M.D. degree from the University of Minnesota Medical School in 1893 and began practice at Hinckley in time to figure heroically in the Great Hinckley Fire of 1894, helping others and himself, escaping on the Great Northern train through the flames to Duluth. He immediately returned on the first relief train and worked for hours treating the burned and identifying the dead.

He married Clara Hay of Pine City in 1896. He is survived by one son, Angus S. Stephan, of Harris, Minnesota, and one daughter, Mrs. E. L. (Ruth) Beyer, of Kansas City. Mrs. Stephan and a foster son, Raymond, preceded him in death.

Dr. Stephan served as surgeon for both the Great Northern and Northern Pacific Railroads. He was a charter member of the Hinckley Lodge A.F. and A.M. and for many years belonged to the Modern Woodmen and the Royal Neighbors of America. He was a member of the Pine County Medical Society, the Minnesota State Medical Association, and the American Medical Association.

◆ Reports and Announcements ◆

AMERICAN ACADEMY OF GENERAL PRACTICE MINNEAPOLIS CHAPTER

The annual meeting of the Minneapolis Chapter of the American Academy of General Practice was held in Minneapolis on December 11. Dr. Herman E. Drill, Hopkins, was elected president of the organization. Other officers elected include Dr. E. G. Oppen, vice president; Dr. Alexander J. Ross, secretary-treasurer, and Dr. Aaron Friedell, program chairman, all of Minneapolis.

AMERICAN COLLEGE OF PHYSICIANS

A six-day postgraduate course in peripheral vascular diseases, sponsored by the American College of Physicians, was held in Rochester November 27 through December 2. Director of the course was Dr. Walter F. Kvale of the Mayo Clinic. Principal speaker at a special dinner during the course was Dr. William S. Middleton, president of the American College of Physicians and dean of the University of Wisconsin Medical School.

WESTERN SURGICAL ASSOCIATION

The fifty-eight annual meeting of the Western Surgical Association was held in Minneapolis November 29 through December 2. Several hundred surgeons from throughout the nation watched operations in Minneapolis hospitals and attended clinics at Minneapolis General and Veterans Hospitals. A feature of the session was a group of reports on experimental work done by the University of Minnesota Department of Surgery. Forty scientific papers were presented during the meeting.

NATIONAL CONFERENCE ON MEDICAL SERVICES

The twenty-fourth annual meeting of the National Conference on Medical Services will be held February 11 in the Red Lacquer room of the Palmer House in Chicago.

The meeting is of special interest to presidents, secretaries, and public relations personnel of state and county medical societies.

FELLOWSHIP AVAILABLE

Ten fellowships supported by the Graduate College of the University of Illinois will be awarded to qualified scholars who contemplate academic careers in the medical and allied sciences. Stipends of $1,800 to $2,400 are available for medical and dental graduates with a maximum of $3,000 for unusually well-qualified applicants. Exemption from tuition fees is provided for all appointees.

(Continued on Page 88)

ANNUAL CLINICAL CONFERENCE

CHICAGO MEDICAL SOCIETY

March 6, 7, 8, 9, 1951 • Palmer House, Chicago

A conference planned to keep physicians abreast of the new things which are developed from year to year.

Special feature of the 1951 Conference—DAILY TEACHING DEMONSTRATION PERIODS from 11:00 to 12:00 noon and 1:30 to 3:00 P.M. Demonstrations will cover:

- Amputations and Prostheses
- Patients Treated with ACTH and Cortisone
- Dermatologic Clinic
- Organization of a Blood Bank
- Neurological Clinic
- Sterility Tests
- Speech Without Larynx
- Proper Application of Casts and Splints in Fractures
- Local Anesthesia
- Fluid and Electrolytic Balance in Surgery
- Use and Misuse of Obstetrical Forceps
- Common Problems in X-Ray Interpretations
- Laboratory Tests (Diabetes, Proper use of Insulin, Prothrombin Tests)

Thirty-four outstanding teachers and speakers will present half-hour lectures on subjects of interest to both general practitioner and specialist.

Four PANELS on timely topics

Scientific exhibits worthy of real study and helpful and time-saving technical exhibits.

The CHICAGO MEDICAL SOCIETY ANNUAL CLINICAL CONFERENCE should be a MUST on the calendar of every physician. Plan now to attend and make your reservation at the Palmer House.

It is advisable to use
a preparation whose
action and potency
are known.

FELLOWSHIP AVAILABLE

(Continued from Page 86)

Registration for work toward M.S. or Ph.D. degrees is required.

Applicants need not have completed clinical internships. Minimum requirements are Bachelor's and M.D. degrees. Evidence of scholarship and promise of research ability are primary considerations. The fellowships provide an opportunity for research experience in the basic sciences and the application of these sciences to clinical investigation.

Applications must be received by February 15 with selections to be announced by April 1. Forms may be obtained from the Associate Dean of the Graduate College, University of Illinois, 808 S. Wood Street, Chicago 12, Illinois.

MINNESOTA SOCIETY OF NEUROLOGY AND PSYCHIATRY

The regular dinner meeting of the Minnesota Society of Neurology and Psychiatry was held at the Town and Country Club, Saint Paul, Tuesday, January 9, 1951.

Proposed active members ballotted upon were Drs. Jorge A. Lazarte and Sidney K. Shapiro.

The scientific program was as follows:

1. Clinical Application of the Electroencephalogram (Inaugural thesis) — V. Richard Zarling, M.D.
2. The Cardiac Risk of Electroshock Therapy (Inaugural thesis) — Clarence J. Rowe, M.D.

CANCER STUDIES

The Minnesota Department of Health is now in the process of analyzing the reports of cancer patients who were hospitalized in Minnesota during the last three years. Added to this will be an analysis of positive cancer biopsies from pathologists received during 1950. This three-year study of cancer incidence and distribution in Minnesota will furnish data for special studies on cancer to determine what may be necessary to facilitate diagnosis, treatment, and follow-up of cancer patients in many areas of the state.

There are now assembled in the files 15,000 cancer cases reported by hospitals throughout the state and over 5,000 biopsy reports of positive cases.

This study was undertaken as a time-limited project. From earlier reports already published and occasional surveys made on this data, it seems evident that there is little change in the cancer picture from year to year. In view of this observation it seems reasonable to assume that sufficient material may be on hand at the present time to give the over-all picture of cancer in Minnesota.

In consideration of the above, the Minnesota hospitals and pathologists have been asked to temporarily discontinue the reporting of cancer cases to the Minnesota Department of Health.

During the three years of the study, there has developed a co-operative spirit between hospitals, medical profession and the Minnesota Department of Health as evidenced by the fact that every hospital and all pathologists have sent reports of cancer cases. The staff of the Minnesota Department of Health working on this project is deeply grateful for the fine co-operation of all those who supplied material for the study.

CONTINUATION COURSE IN CARDIOVASCULAR DISEASES

Dr. Emile Holman, Professor of Surgery, Stanford University School of Medicine, San Francisco, will be the visiting faculty member for the course in Cardiovascular Diseases to be presented at the Center for Continuation Study on February 15 to 17, 1951. Dr. Holman will also deliver the annual E. Starr Judd Lecture in Surgery on the evening of Thursday, February 15. His subject will be "Experimental and Clinical Observations on Constrictive Pericarditis."

E. STARR JUDD LECTURE

The eighteenth E. Starr Judd Lecture will be given by Dr. Emile Holman, professor of surgery, Stanford University School of Medicine, San Francisco, on February 15 at 8:15 p.m. in the Amphitheater, Medical Sciences,

The late E. Starr Judd, an alumnus of the Medical School of the University of Minnesota, established this annual lectureship in surgery a few years before his death.

WASHINGTON COUNTY SOCIETY

At the annual meeting of the Washington County Medical Society the following officers were elected: Dr. George McC. Ruggles, Forest Lake, president; Dr. Ray G. Johnson, Stillwater, vice president; Dr. E. Sydney Boleyn, Stillwater, secretary-treasurer; Dr. Boleyn, delegate; Dr. Wade R. Humphrey, Stillwater, alternate delegate; Dr. Johnson, censor for 1951-1953.

NATIONAL SOCIETY FOR CRIPPLED CHILDREN AND ADULTS

The National Society for Crippled Children and Adults will hold its 1951 annual convention in Chicago, October 3 through 6. Sessions will be held in the Palmer House. New techniques and new advances in the care and treatment of crippled children will be emphasized throughout the convention meetings by medical and other leaders in the specialized professional fields concerned with crippling conditions.

Woman's Auxiliary

PRESIDENT EXTENDS GREETINGS

Mrs. Charles W. Waas

To every Minnesota doctor's wife, and particularly to our own Auxiliary members, may I extend wishes that the New Year will give to each one her share of health, good fortune and happiness.

MEMBERSHIP REACHES 2,048

Mrs. John Dordal

The state treasurer was pleased and proud of the work done by all the county treasurers. To be able to meet the "deadline" with all 2,048 members paid up, was the result of splendid co-operation of the county treasurers and of some five presidents whose county treasurers were vacationing. The National President complimented Minnesota on its fine record.

Many auxiliaries have started collecting 1951 dues. Each auxiliary should try for an "every doctor's wife" membership. When all possible dues are in, please send them to the state treasurer promptly.

PROMINENT AUXILIARY MEMBER DIES

Mrs. Rachel S. Branham, wife of Dr. Donald S. Branham, St. Peter, died in Mankato on October 31, 1950. Mrs. Branham was the first president of the recently organized auxiliary of Freeborn county. The Branhams first moved to Albert Lea in 1924 where Dr. Branham practiced until 1941 when he entered active military service. The Branhams returned to Albert Lea in 1946 and continued to maintain their home there until July 1949. At that time, they moved to St. Peter, where he is now assistant superintendent of the St. Peter State Hospital. Mrs. Branham became an active member in the Nicollet-LeSueur County Medical Auxiliary after moving to St. Peter.

She is survived by her husband, Dr. D. S. Branham, a son Robert of South Saint Paul, a granddaughter, Pamela Ann, and a sister, Miss Marie Johnson, Coleraine.

PRESIDENT-ELECT REPORTS ON STATE PRESIDENT CONFERENCE

Mrs. F. P. Moersch

In November, 1950, Mrs. Charles W. Waas, state auxiliary president, and myself attended the Seventh Annual Conference of State Presidents, Presidents-Elect and National Chairmen of Standing Committees of the Woman's Auxiliary to the American Medical Association in Chicago. The theme of the conference was "Public Service Through Health Education." It was a good meeting, both stimulating and inspiring. Minnesota doctors' wives should be determined to make the Woman's Auxiliary to the Minnesota State Medical Association even more important than it is at the present time.

Mrs. Herold, Shreveport, La., National President, called the conference to order. She and Mrs. Wahlquist, Minneapolis, President-Elect of the national auxiliary, contributed a great deal toward the successful conduct of the meeting.

In addition to panel discussions by committees on organization, public relations (Mrs. Waas participated in this panel with a talk on Health Days), program, Today's Health, legislation, and reports of standing committee chairmen, talks were heard by Dr. Ernest B. Howard, Assistant Secretary of the AMA; Dr. George M. Lyons, Special Assistant of the Atomic Medicine Section and Chief Radio Isotope Section of the Veterans Administration; Dr. W. W. Bauer, Director of the Bureau of Health Education of the AMA; Dr. Thomas Hull, Director of the Bureau of Exhibits of the AMA; Ralph Greer, Director of Motion Pictures of the AMA; Miss Leone Baxter and Clem Whitaker, Directors of the National Education Campaign of the AMA.

The work of the auxiliary was praised by guest speakers, who referred to the organization as "the right arm of the AMA," and as "ball carriers for the AMA." Those attending were assured that the AMA appreciates the help it is receiving from the auxiliary members.

After taking stock of the Woman's Auxiliary to the Minnesota State Medical Association, it was felt that Minnesota has a splendid organization. All but a few counties are organized and these counties have members at large. However, in checking over the roster, it was discovered that there are many eligible women whose names do not appear as auxiliary members. Belonging to the auxiliary stimulates interests in health matters, and members can serve better as a liaison between the doctors and the public. It must be evident to all that, in these critical times when there are forces at work threatening liberties and whittling away at freedom, the auxiliary should stand back of the AMA in its fight against socialized medicine.

To the president-elect falls the duty of being organization chairman. If, therefore, any auxiliary members have problems which come under this department, please write to me.

As one of the auxiliary committee chairmen has said: "It's never too late to be what you might have been."

Best wishes for the coming New Year!

There is a difference between talent and genius. Talent does what it can, genius what it must. But it is the little more that makes the difference.

WHERE ALCOHOLICS ACHIEVE INSPIRATION FOR RECOVERY

Where gracious living, a homelike atmosphere and understanding companionship contribute to successful rehabilitation.

200 acres on the shores of beautiful Lake Chisago

The methods of treatment used at the Hazelden Foundation are based on a true understanding of the problem of alcoholism. Among the founders of the nonprofit Hazelden Foundation are men who have recovered from alcoholism through the proved program of Alcoholics Anonymous and who know the problems of the alcoholic. All inquiries will be kept confidential.

A DISTINGUISHED BAG

with a *Distinguishing* feature

"OPN-FLAP"

HYGEIA MEDICAL BAGS

. . . it holds ⅓ more!

The famous patented "OPN-FLAP" feature, designed with the advice of physicians, permits opening of Hygeia Bag to the full length and width of top, thus allowing ⅓ more space for packing. Hygeia is the only medical bag that can be packed to the very top and easily zipped closed without crushing or jamming the contents. Made of the finest top grain leathers by luggage craftsmen, the "OPN-FLAP" Hygeia Medical Bag is preferred by doctors everywhere.

Of General Interest

ACTH and Cortisone Contraindicated in Tuberculosis.—A warning against the use of ACTH and cortisone in patients with active tuberculosis has been issued by the Committee on Medical Research and Therapy of the American Trudeau Society, medical section of the National Tuberculosis Association.

Because of their apparent adverse effect on resistance to tuberculosis, the committee also urged that the hormones be used with "extreme caution" in persons with possible latent tuberculosis and that, as a caution, physicians examine their patients for tuberculosis before instituting hormone therapy for any cause.

The full statement follows:

"Because the action of ACTH and cortisone upon the factors of resistance to tuberculosis has been shown to be deleterious in at least three species of experimental animals (mice, guinea pigs and rabbits), and there is strongly suggestive evidence along the same lines in human beings, it is recommended that these substances *not* be used in patients with active tuberculosis, and that they be used with extreme caution even in human beings with possible latent tuberculous infection, until such time as, further investigative work has shown that such administration may be safe. The routine diagnostic examination for tuberculosis of patients under physicians' care is especially necessary for patients who are being considered for ACTH or cortisone therapy."

* * *

Dr. Philip H. Soucheray has become associated with Dr. John R. Meade in the practice of internal medicine, with offices at 836 Lowry Medical Arts Building, Saint Paul.

* * *

Dr. R. E. Carlson and **Dr. Manley F. Juergens** of Stillwater attended a course in child psychiatry at the University of Minnesota from November 27 to December 1.

* * *

Dr. Dean Sherwood Luce of Canton, Massachusetts, was chosen by the AMA delegates at Cleveland in December as the family doctor of 1950. Dr. Luce, at the age of seventy-four, is still answering calls day and night and has been since 1905 when he first put out his shingle in Canton.

* * *

It was announced on November 29 that **Dr. Wallace R. Anderson,** a former pediatrician at the Austin Clinic in Austin, was en route to Japan in Army service. Dr. Anderson, who held a commission in the Naval Reserve, had been called to active duty about two weeks previously and assigned to duty with the Army.

* * *

Dr. John Briggs, Saint Paul, spoke on the subject of cardiac arrhythmias at a meeting of the Minnesota Society of Anesthesiologists in Saint Paul on December 2.

* * *

Dr. Wade R. Humphrey of Stillwater recently returned from a visit to his native state, Virginia.

* * *

Dr. Walter Eisenman, formerly of Coleraine, has begun a fellowship in obstetrics and gynecology at the Mayo Foundation in Rochester.

* * *

Dr. and Mrs. J. F. Weir returned to Rochester late in November after a three-month tour of Europe. Dr. Weir, head of a section in medicine at the Mayo Clinic, attended the First International Congress of Internal Medicine in Paris and visited clinics and hospitals throughout Europe.

* * *

The new coroner for Todd County is **Dr. A. J. Lenarz** of Browerville, who won the office in the November general election when his name was written on the ballot by many of his friends. No candidate had filed for the office. Dr. Lenarz, a graduate of Marquette University, has practiced in Browerville since 1936.

* * *

On December 1, **Dr. R. I. Gruys** dissolved his partnership with the Cottonwood County Clinic and established his own practice in Windom. Dr. Gruys has practiced in Windom since July, 1949.

* * *

Dr. Benjamin Spock, former Mayo Clinic staff member, has joined the University of Pittsburgh Mental Health Center. At Rochester Dr. Spock was co-director of the Rochester Health Institute. At Pittsburgh he will be professor of child development and a staff member in the Department of Pediatrics at Children's Hospital and the Graduate School of Public Health.

* * *

December 10 was Appreciation Day at Buffalo Lake when local residents gathered to honor **Dr. E. C. Gaines** for his fifty years of medical service in the area. The day's festivities included a banquet at noon, an afternoon program of talks and music, an "open-house" supper, and an evening of visiting and renewing old acquaintances.

Dr. Gaines is a graduate of the University of Minnesota Medical School. He moved to Buffalo Lake from Steen in November, 1900.

* * *

It was announced on November 30 that **Dr. Harold S. Orwoll** of St. Peter had enlisted in the medical corps of the Navy and had moved to Decorah, Iowa,

to await orders to active duty. Shortly before he joined the Navy Dr. Orwoll had been elected county coroner.

* * *

Dr. I. L. Mitby, formerly of Aitkin, has opened offices for the practice of medicine at 7634 Lyndale Avenue South, Richfield (Minneapolis suburb). Dr. Mitby was in practice at Aitkin for twelve years.

* * *

Dr. E. T. Rechlitz, who was associated with Dr. F. G. Folken in the Folken Clinic at Albert Lea since 1948, has moved to Beloit, Wisconsin, to open his own practice. Dr. Rechlitz is a graduate of the Marquette University School of Medicine.

* * *

Five **Mayo Clinic** staff members officially retired at the annual meeting of the staff in Rochester on November 20. They are Dr. W. L. Benedict, Dr. A. C. Broders, Dr. N. M. Keith, Dr. G. B. New and Dr. R. M. Wilder. Together the five had served a total of 169 years with the clinic.

At the election of staff officers Dr. Paul A. O'Leary was elected president, Dr. A. C. Davis, vice president, and Dr. N. B. Coventry, secretary.

* * *

In Annandale the front of the office of **Dr. Lester H. Bendix** has been remodeled. The new front is more modern in appearance, with aluminum-trimmed windows set in a brick facing.

* * *

Dr. John W. Helland of Spring Grove was presented with a special plaque, in recognition of his twenty years of service to the Houston County Christmas Seal organization, at the annual meeting of the Houston County Farm Bureau in Spring Grove late in November.

* * *

Dr. E. S. Boone, formerly with the Veterans Administration in Sioux Falls, South Dakota, began practicing medicine at Luverne just after January 1.

* * *

Dr. Philip S. Hench and **Dr. Edward C. Kendall,** both of Rochester, and **Dr. Thaddeus Reichstein,** Swiss professor, were presented with the Nobel Prize in medicine at ceremonies in Stockholm, Sweden, on December 10. The award was made by King Gustav VI.

On December 13, Dr. Hench crowned the Swedish queen of Christmas, Lucia, at a special festival. The honor of placing the crown was given to Dr. Hench since funds raised at the festival will be used for research for rheumatic children.

* * *

In November residents of Carlton and the surrounding area launched a campaign to forestall possible recall into military service of **Dr. E. A. Pasek,** the only physician in the community. They asked for deferment of Dr. Pasek, a veteran of World War II, on the grounds that he is essential to the health and welfare of the community.

Dr. Eivind Klaveness, Saint Paul, celebrated his eightieth birthday on November 25. He announced that he had no intention of ever retiring from active practice.

* * *

Dr. Karl Pfuetze has resigned as medical director and superintendent of the Mineral Springs Sanatorium, effective January 15, to become medical director and superintendent of a new 500-bed tuberculosis hospital now under construction at the University of Illinois Medical Center in Chicago.

Dr. Pfuetze joined the staff of the Mineral Springs Sanatorium in 1940 as assistant to the late Dr. William Beadie, then superintendent. When Dr. Beadie resigned in 1941, Dr. Pfuetze was named acting superintendent. His appointment as superintendent and medical director came a few months later.

* * *

Dr. Russell M. Wilder, who recently retired as professor of medicine and head of a section in medicine at the Mayo Clinic, has taken a position with the United States Public Health Service.

* * *

Dr. Edward C. Sargent of Austin spoke on the subject of cancer over station KAUS, Austin, on November 30. The talk was sponsored by the Mower County Cancer Society.

* * *

A community celebration was held in Fisher on November 26 to honor **Dr. William H. Hollands** for his forty-one years of medical service in the area. Dr. Hollands began his practice in Fisher in 1909, immediately after he had completed his medical training. He has always been active in community affairs and has served as health officer and as mayor for two terms.

* * *

Dr. John E. Teisberg has become associated in the practice of industrial medicine and surgery with Dr. Robert J. Richardson. Their offices are located at 2395 University Avenue, Saint Paul.

* * *

Dr. John R. Fischer, Owatonna, was elected Steele County coroner by a write-in vote of more than 1,000 during the general election in November. No candidate filed for the office.

A graduate of the Washington University School of Medicine, Dr. Fischer has been practicing in association with Dr. J. A. McIntyre in Owatonna since July.

* * *

Dr. Louis B. Woolner, Rochester, spoke on "Primary Hyperparathyroidism: A Study of 112 Consecutive Cases" at a meeting of the Minnesota Pathological Society at the University of Minnesota on November 21.

HOSPITAL NEWS

The results of recent elections of hospital staff officers at three Minnesota hospitals are as follows:

St. John's Hospital, Saint Paul.—Dr. Herbert L.

Storm Warning

MANY women see but do not identify the first disturbing signs of the menopause, and therefore reach their physicians' consulting rooms in double trouble—with anxiety superimposed upon the original symptoms.

At such times, especially, the physician needs an estrogenic product of recognized uniformity and potency—one which, like *dorestro* Estrogenic Substances, has proved its reliability through long compliance with the highest scientific standards, plus widespread clinical use.

When storm warnings are out and prompt action is indicated, *dorestro* will meet your requirements fully.

Dorestro Estrogenic Substances are packaged to provide ample choice of potencies in both oil and aqueous media.

Dedication ceremonies for the **Dr. Henry Schmidt Memorial Hospital** at Westbrook were held on November 26. The dedication address was given by Dr. George A. Earl of Saint Paul. Tours were conducted through the new structure, and lunch was served to visitors.

* * *

Dr. Karl S. Klicka, formerly of Mount Vernon, New York, has become medical director of **St. Barnabas Hospital** in Minneapolis. He previously was director of the Woman's Hospital in New York City. A graduate of Western Reserve University, Dr. Klicka took advanced training in hospital administration at the University of Chicago.

* * *

The **Murray County Memorial Hospital** at Slayton was dedicated on December 12, with Governor Luther Youngdahl as the principal speaker. The modern forty-eight-bed hospital is X-shaped in design and can be expanded by future construction to a maximum of seventy-two beds.

* * *

A birthday party for the thirty-year-old **Charles T. Miller Hospital** in Saint Paul was held on December 6. Attending the party were employes, trustees and the medical staff of the hospital, which was founded on December 1, 1920. Among the entertainment was a showing of motion pictures taken by Dr. Vernon Smith of Saint Paul.

* * *

A group of residents of Red Lake Falls met on November 13 to formulate plans for a campaign to raise funds to equip and furnish the new **St. John's Hospital** at Red Lake Falls. An advisory committee was formed, and plans were made to select key leaders at a future meeting.

* * *

St. Barnabas Hospital in Minneapolis has established a medical photographic laboratory, believed to be the only full-time, completely equipped department of its kind in Minnesota outside of the University of Minnesota Hospitals. In charge of the laboratory is Leslie Hier, Jr., a trained medical photographer. The laboratory is housed on the first floor of one of the hospital's buildings.

BLUE CROSS—BLUE SHIELD NEWS

Physicians of Minnesota should be interested in knowing that for the past two months over 6000 claims for medical service have been paid by Blue Shield each month. Prior to that time the highest monthly case load slightly exceeded 4900. In addition to these claims paid, however, were some 600 claims which were rejected, and the item most frequently responsible for rejection was that the claimant was not a Blue Shield subscriber.

Of the 6,009 cases, 4,403 were for hospitalized patients and 1,606 were for compensable services rendered in the physician's office. The total payment was $205,167.76 for care rendered in the hospital and $22,562.20 was for office care.

Participating doctors of medicine received $39,317.15 for 1,774 medical cases, $138,720.82 for 3,297 surgical cases and $35,399.00 for 660 obstetrical deliveries. Minnesota non-participating doctors of medicine received $1,437.72 for 46 medical cases, $5,674.49 for 78 surgical cases and $360.00 for 51 obstetrical deliveries. Physicians practicing out of the state of Minnesota were compensated for 147 cases in the amount of $6,820.75.

Blue Shield enrollment for October 1950 increased by 7,407 participant subscribers or 2,516 contracts. The total contracts in effect as of October 31 was 147,505 and the total number of persons covered was 385,512. On October 31 Minnesota Blue Cross had 377,295 contracts in effect with 1,023,572 participants.

The number of medical forms received daily varies from approximately 250 to 400. In addition there is a considerable amount of correspondence relative to general Blue Shield information and inquiries as to our method of determining payment. Due to the volume of inquiries and also the similarity of reply in many instances it has seemed expedient and economical to utilize form letters insofar as possible. However, at such time as the work load and assignment of trained personnel permits, every effort will be made to personalize the greater part of Blue Shield correspondence.

Much consideration is being given to the question of foreknowledge. The Blue Shield contract excludes benefits for the first ten months of the contract for the treatment of a condition known by the subscriber or any of his dependents to exist at the time the contract is applied for. Medical history on such claims is obtained from the attending physician; medical history of previous care will also be requested from the subscriber. The determining factor in such cases is not the knowledge of the need for surgery or treatment, but the knowledge of the existence of the condition.

At this time Blue Shield wishes to extend to the medical profession every good wish for a happy and successful New Year and to express our appreciation for its co-operation and assistance in the past.

We need to teach people not only how to avoid tuberculosis, how to recover from tuberculosis and how to stay recovered, but also how to be healthy and how to make the most of life. . . . We cannot do an effective job in tuberculosis unless we do also a thoroughly good job of health education—that is, education in health.—Iago Galdston, M.D., Nat. Tuberc. A. Tr., 1949.

SIR WILLIAM OSLER. *Aphorisms from his Bedside Teachings and Writings.* Collected by Robert Bennett Bean, M.D. Edited by William Bennett Bean, M.D. 159 pages. Price, $2.50. New York: Henry Schuman, Inc., 1950.

To be the "Boswell" to Sir William Osler would be a labor of love under any circumstance. The Doctors Bean have accomplished their task admirably in this collection of aphorisms. Osler's humanistic approach to medicine has rarely been equaled. His writings could be cosmopolitan, sophisticated, or humorous, but always pertinent to the occasion. Unfortunately, taking a phrase out of the whole text often makes the statement trite or does not convey the whole meaning. The authors hope that these aphorisms will spur the reader into reading the whole essay from which they were taken.

This little volume should have wide appeal.

C. E. Rea, M.D.

THE NATIONAL FORMULARY. Ninth Edition. Prepared by the Committee on National Formulary, under the supervision of the Council by authority of the American Pharmaceutical Association. Official for November 1, 1950.

Each druggist in Minnesota according to law must have a copy of the U. S. Pharmacopoeia, the National Formulary and the U. S. Dispensary.

The Pharmacopoeia was first published in 1820 and consisted of preparations considered by members of the medical profession to possess the greatest therapeutic merit.

The U. S. Pharmaceutical Association was formed in 1852. In time, the need of pharmacists for another standard volume to contain the many much-used preparations not included in the U.S.P. became apparent. The U. S. National Formulary of Unofficial Preparations was the result. The first volume appeared in 1888.

In 1906, the name of the volume was abbreviated to National Formulary and, according to the terms of the Federal Food and Drugs Law, was declared "official" as well as the U. S. Pharmacopoeia.

The National Formulary contains no secret drug nor is any drug admitted under a proprietary or trade-mark name or if the composition or process of manufacture is secret. No claims are made for therapeutic value of any of the items contained.

The National Formulary is published now more frequently than every ten years. The eighth volume became official on November 25, 1946, and the ninth on November, 1950. Although revision results in addition and deletion, many of the newer remedies are conspicuous by their absence.

The pharmacist is well equipped with a U.S.P. and the N.F. He could probably get along just as well without the U. S. Dispensatory. The physician has little need to refer to any of the three and is kept up to date by reference to New and Non-official Remedies.

C. B. D.

PRINCIPLES AND PRACTICE OF SURGERY. By Jacob K. Berman, A.B., M.D., F.A.C.S., Associate Professor of Surgery, Indiana University School of Medicine; Associate Professor of Oral Surgery, Indiana University School of Dentistry; Chief Consultant in Surgery, Billings V. A. Hospital, Ft. Benjamin Harrison, Ind.; Director of Surgical Education and Surgical Research, Indianapolis General Hospital. 1378 pages. Illus. Price $15.00. St. Louis: C. V. Mosby Co., 1950.

This is a new textbook of surgery which the student will find unique because of two features. The first is its emphasis on basic sciences and their correlation with surgical principles. Second is the author's style, borrowed from Hippocrates who taught by aphorisms or maxims, concise statements of principle. This imparts a somewhat choppy quality to the text but will be attractive to the student in his quest for "pearls."

The book includes a short historical review followed by several chapters on the local response of tissues to various forms of injury such as trauma and infection. Fluid balance, hemorrhage and shock are dealt with extensively. The subsequent review by systems is detailed and adequate with the possible exception of the chapter on bones and joints which omits any description of fractures.

Tables, illustrations, and microphotographs are excellent, and scattered throughout are sketches of operative technique in sufficient detail to give the student some idea of surgical treatment. This is a feature generally not found in standard texts.

Supplements the sun...
removes the shadow of RICKETS

Rickets may be found in apparently healthy and well nourished infants due to an insufficient intake of vitamin D plus inadequate exposure to ultraviolet rays.

It is now generally accepted that a vitamin D supplement should be given regularly not only to infants but to older children and adolescents. Mead's Oleum Percomorphum With Other Fish Liver Oils and Viosterol is useful for this purpose.

Mead's Oleum Percomorphum

1. Is a highly potent† source of natural vitamins A and D.
2. May be given in drop doses that are easily administered and well tolerated, and is supplied in capsule form also.
3. Has a background of sixteen years of successful clinical use.

†Potency: 60,000 U.S.P. units of vitamin A and 8500 U.S.P. units of vitamin D per gram. Each drop supplies 1250 units of vitamin A and 180 units of vitamin D; each capsule, 5000 units of vitamin A and 700 units of vitamin D.

Supplied in 10 cc. and 50 cc. bottles; and in bottles of 50 and 250 capsules.

MEAD'S
OLEUM PERCOMORPHUM

obar pneumonia with bacteremia

fter initiation of Chloromycetin therapy the temperature returned o normal within forty-eight hours, and prompt subsidence of the ough and chest pain occurred."[1]

ronchopneumonia

linically, the child improved rapidly and was out of the oxygen ent in 24 hours and afebrile in 36 hours."[2]

rimary atypical (virus) pneumonia

n the first evening of Chloromycetin treatment the subjective symptoms vere less severe, and within 24 hours his fever began to settle."[3]

Chloromycetin is effective against practically all pneumonia-causing organisms. Response is strikingly rapid, temperature drops, the lungs clear... and your patient is convalescent.

Chloromycetin is unusually well tolerated. Side effects are rare, severe reactions almost unknown.

There Is No Magic

YOU CANNOT expect to retain your profits from your practice as a physician regardless of taxation unless you provide yourself with income protection. You daily strive to make and save enough for unforeseen needs, then along comes an accident or illness taking everything, even to the point of putting you in debt—all because you procrastinate about securing income protection.

YOU CAN expect to secure the best value in non-cancellable Accident and Sickness insurance through the plan investigated and tested by your Society. DELAY holds no increased value—ACT NOW.

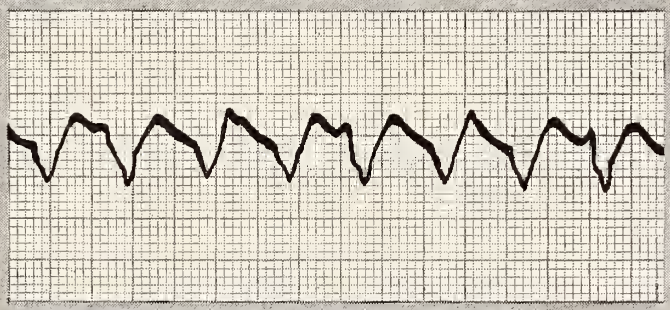
a new drug . . .

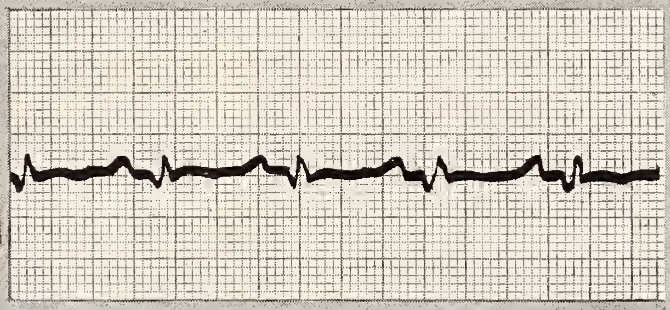
for the treatment of ventricular arrhythmias

PRONESTYL *Hydrochloride*

Squibb Procaine Amide Hydrochloride



Lead II. Ventricular tachycardia persisting after six days of oral quinidine therapy (8 Gm. per day).



Lead II. Normal sinus rhythm after oral Pronestyl therapy.

Oral administration of Pronestyl in doses of 3-6 grams per day, for periods of time varying from 2 days to 3 months, produced no toxic effects as evidenced by studies of blood count, urine, liver function, blood pressure, and electrocardiogram. Pronestyl may be given intravenously with relative safety.

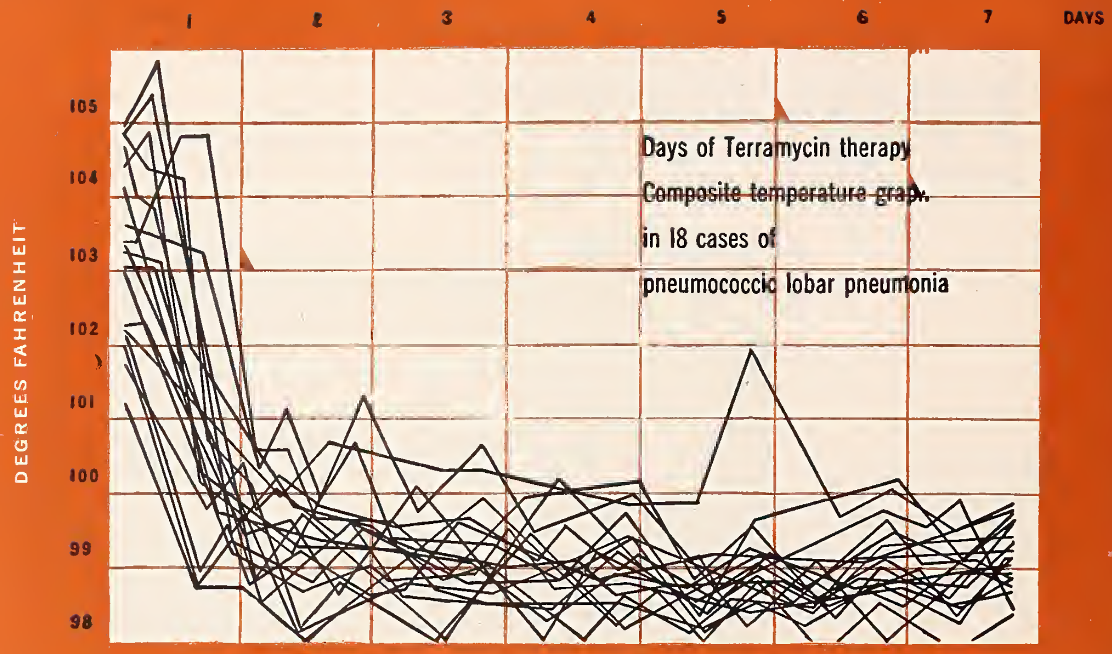
PRONESTYL IS A TRADEMARK OF E. R. SQUIBB & SONS

Pronestyl Hydrochloride Capsules, 0.25 Gm., bottles of 100 and 1000.
Pronestyl Hydrochloride Solution, 100 mg. per cc., 10 cc. vials.

For detailed information on dosage and administration, write for literature or ask your Squibb Professional Service Representative.

SQUIBB MANUFACTURING CHEMISTS TO THE MEDICAL PROFESSION SINCE 1858.

PNEUMOCOCCIC LOBAR PNEUMONIA



Days of Terramycin therapy
Composite temperature graph
in 18 cases of
pneumococcic lobar pneumonia

CRYSTALLINE

Terra

"With the exception of one subject . . . there was a dramatic fall in the temperature within twenty-four to thirty-six hours after the first dose of terramycin was given. The major decline in fever occurred during the first twenty-four hours after institution of therapy."

"Improvement in the acute symptoms . . . usually coincided with the fall in temperature. In many instances . . . symptomatic improvement actually preceded the fall in temperature."

Melcher, G. W.; Gibson, C. D.; Rose, H. M., and Kneeland, Y.: J. A. M. A. 143:1303 (Aug. 12) 1950.

Antibiotic Division **Pfizer**

"Excellent" and "dramatic" response

"The response to terramycin therapy was considered excellent in every case and there were no cases in which treatment failed."

Melcher, G. W.; Gibson, C. D.; Rose, H. M., and Kneeland, Y.: J. A. M. A. 143:1303 (Aug. 12) 1950.

Dosage: On the basis of findings obtained in over 150 leading medical research centers, 2 Gm. daily by mouth in divided doses q. 6 h. is suggested for most acute infections.

Supplied: 250 mg. capsules, bottles of 16 and 100;
100 mg. capsules, bottles of 25 and 100;
50 mg. capsules, bottles of 25 and 100.

MEAT...and the PROTEIN NEEDS of the DIABETIC

Not less but *more protein* than the traditional gram per kilo of body weight recommended for the non-diabetic individual promotes an increased sense of well-being in the diabetic patient. Liberal amounts of biologically excellent protein, such as that provided by *meat,* are therefore especially useful in dietotherapy.

For supporting the well-being and vigor of the patient, increasing his resistance to infection, and minimizing many of the degenerative changes common in diabetes mellitus, maintenance of body protein reserves is particularly important.[1, 2] The former belief that protein foods, especially meat, engender hypertension and arteriosclerosis, is no longer tenable. On the contrary, deficits in dietary protein are apt to initiate anemia, hypoproteinemia, and retrogressive processes in the kidneys and other organs or tissues.

Ample amounts of high-quality protein foods in the prescribed diet—including generous amounts of meat—are important for maintaining a good nutritional state in the diabetic patient. Such a diet provides the nutritional essentials required in overcoming infections and in prompter healing of traumatic wounds.

Meat, however, is valuable to the patient for more than just its biologically excellent protein. It also furnishes important amounts of iron, thiamine, riboflavin and niacin, and of the newly discovered vitamin B_{12} which, among its several functions, promotes efficient utilization of protein.

ESTINYL®

(Ethinyl Estradiol)

ESTINYL

hinyl estradiol, a derivative of
natural follicular hormone.

ESTINYL . . .

Relieves symptoms rapidly—within 3 days in some patients
vides a "real lift"—a characteristic of estrogens derived from natural sources
Is simply administered—One tablet daily for most patients
s economical—cost is within means of all requiring it.

Schering CORPORATION · BLOOMFIELD, NEW JERSEY

CAMP Scientific Support Fitting Courses stress the importance not only of theory but also the practical application of knowledge in clinical "workshops." Above is shown a group of fitters being instructed in the practical fitting of a patient (pendulous figure type) with a Camp orthopedic back brace.

A BASIC CAMP CREDO

"Education before Sales"

"How skilled is the fitter who assumes the duty of carrying out my instructions when I prescribe a scientific support?"

Camp Scientific Supports are sold and fitted in reputable stores in your community.

Every physician is justified in asking that question.

This year will mark the 23rd annual series of Camp Scientific Support Fitting Courses under medical supervision. Beginning in New York City, they will be held in principal cities throughout the nation. Estimated enrollment will include over a thousand representatives from reliable stores in all parts of the country. These courses are conducted by our Training Director, Medical Director, Designer and a staff of registered nurses. In addition to the formal sessions the nurses are constantly instructing smaller groups and individuals in countless other cities.

Since 1929 we have trained more than 16,000 fitters in the United States and Canada. That is why Camp research, Camp design and Camp craftsmanship can provide the ultimate in service to the patient.

When Lactation Fails

℞ LACTOGEN®

When the supply of breast milk is inadequate or when lactation fails entirely, there is no better formula than Lactogen. Designed to resemble mother's milk, it consists of whole cow's milk modified with milk fat and milk sugar. It differs, however, in one important respect: the protein content of Lactogen in normal dilution is one-third greater than that of mother's milk—2.0% instead of 1.5%.

A Complete Infant Formula In One Package

Lactogen contains all the ingredients of a well-balanced infant formula. In addition, it is fortified with iron to compensate for the deficiency of this mineral in milk.

Easily Prepared . . . Merely Add Water

Lactogen is simple to use. The prescribed amount is stirred into warm, previously boiled water. Either a single feeding can be prepared, or the entire day's quantity can be made up and stored in the refrigerator until used.

THE NESTLÉ COMPANY, INC.
COLORADO SPRINGS, COLORADO

ACCEPTED
COUNCIL ON FOODS AND NUTRITION

NOTABLY HIGH IN PROTEIN CONTENT
Lactogen contains a generous amount of protein . . . more than enough to satisfy every protein need of the rapidly growing infant.

Nothing Competes with the Lure of Sweets

Use it in Sulfonamide Therapy

Tasty Suspension with "Built-In" Alkalinizer

Palatable, orange-flavored DUOZINE Suspension provides, per teaspoonful, 0.15 Gm. each sulfadiazine and sulfamerazine, plus 1.5 Gm. sodium citrate. It's especially good-tasting when diluted in water or fruit juice. In 1-pint bottles.

YOU'LL pave the way for successful sulfonamide therapy when you appeal to small fry with candy-like, good-looking DUOZINE *Dulcet* Tablets. These medicated cubes not only taste but look like a treat—there's nothing about them to remind children of medicine.

But here disguised is a stable, uniformly potent sulfadiazine-sulfamerazine combination (equal parts). These drugs, according to a recent report[1], " . . . qualify at present for first and second place, respectively, as components of any mixture."

With DUOZINE *Dulcet* Tablets, mother can administer accurate dosage merely by counting out the prescribed number of tablets. Dosage can also be readily adjusted to adult needs, and you'll find many grown-ups who prefer this tasty medication to ordinary tablets.

The next time sulfonamides are indicated why not combine treat and treatment? DUOZINE *Dulcet* Tablets in 0.3-Gm. and 0.15-Gm. potencies, bottles of 100. Abbott

How mild can a cigarette be?

● Every day, more and more smokers—and among them many, many doctors—are discovering for themselves just how mild a cigarette can be. They're making their own 30-Day Camel Mildness Tests—smoking Camels regularly for 30 days.

It's a sensible cigarette test. As a doctor, you know there can be no valid conclusion drawn from a one puff comparison—from a trick test that calls for hasty decisions. The Camel 30-Day Test asks you to make a day after day, pack after pack comparison.

If you are not already a Camel smoker, why not try this test? Judge Camel mildness and the rich, full flavor of Camel's choice tobaccos in your own "T-Zone"—the real proving ground for a cigarette. See if the Camel 30-Day Test doesn't give you the most enjoyment you've ever had from smoking!

Make your own 30-Day Camel Mildness Test in your own "T-Zone"— That's T for Throat, T for Taste. See if you don't change to Camels for keeps!

All Children Can Benefit from
this Hot Drink at Breakfast

The problem of encouraging children to eat an adequate breakfast finds easier solution when Ovaltine in hot milk is recommended as a breakfast beverage. Many children clamor for a hot drink at the morning meal and Hot Ovaltine is the right kind of drink to recommend.

A cup of Hot Ovaltine makes an excellent contribution of virtually all essential nutrients, adding substantially to the nutritional start for the day. It also serves in a gustatory capacity by enhancing the appeal of breakfast and making other foods more inviting.

The nutrient contribution made by a cup of Ovaltine is apparent from the table below. Note the wealth of essentials added to the nutritional intake by making the simple recommendation of adding a cup of Hot Ovaltine to the child's breakfast.

AUREOMYCIN

The insatiable demand for aureomycin throughout the world has necessitated not only a tremendous expansion of our production capacity in the United States, but the setting up of highly complex technical organizations in other countries, looking toward eventual universal distribution of this extraordinarily valuable antibiotic. The huge tanks in which the basic fermentations are carried out have a capacity of 20,000 gallons each. Rigid precautions are taken to avoid contamination by viruses (actinophages) which feed upon actinomyces, and by other microorganisms, which may necessitate the discarding of an entire batch. The efficiency of this fermentation has been increased steadily since the first introduction of aureomycin. This has been accomplished for the most part by the use of improved media and of higher-yielding mutants.

Aureomycin is now available in a number of convenient forms, for use by mouth and in the eye. New forms of this antibiotic of unsurpassed versatility are constantly being brought out.

Pure Crystalline Vitamin B_{12}

The Only Form Of This Important Vitamin Official In The U.S.P.

PREFERRED BECAUSE

potency, purity, and lack of toxicity of *crystalline* vitamin B_{12} are clearly established.

Potency: Potency of this U.S.P. product is accurately determined by precise weight.

Purity: Pure anti-anemia factor.

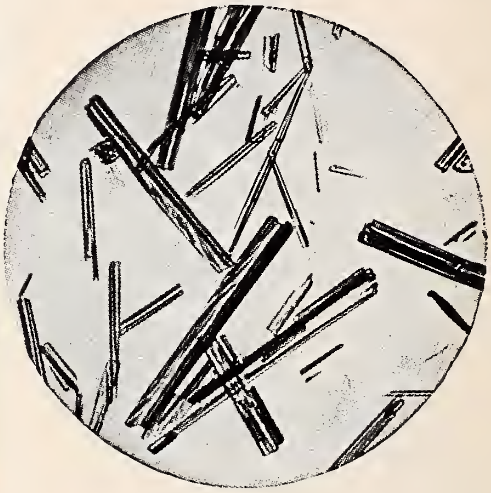
Efficacy: Produces, in microgram dosage, maximum hematologic and neurologic effects.

Tolerance: Extremely well tolerated; "no evidence of sensitivity" has been reported.

Toxicity Studies:

In recent pharmacologic investigations, extremely large doses of *crystalline* vitamin B_{12} (1,600 mg./Kg.) caused no toxic reactions in any of the animals treated. In contrast, 3 mg./Kg. of a "*concentrate*" caused fatal reactions in 100 per cent of the animals treated.

Merck—first to isolate and produce vitamin B_{12}—supplies Crystalline Vitamin B_{12} in saline solution under the trademark Cobione.* Your pharmacist stocks Cobione in 1 cc. ampuls containing 15 micrograms of crystalline vitamin B_{12}.



Crystalline Vitamin B_{12}

Cobione is the registered trade-mark of Merck & Co., Inc. for its brand of Crystalline Vitamin B_{12}.

For Your Security and Peace of Mind

A Disability Life Income Program for Eligible Members of Your State Professional Group

Lifetime Protection
for both
Sickness & Accidents

A SILENT PARTNER . . . Continental's Companion Policies

ACCIDENT AND CONFINING SICKNESS

Pays $ 400	Monthly Benefits first 2 years ($200 1st mo.) and
$ 300	Monthly Benefits thereafter for Life.
Pays $ 600	Additional Monthly Benefits First 3 Months for Hospital Disability.
Pays $ 7,500	Accidental Death Benefits, $12,500 Double Indemnity.
Pays $10,000	Loss of Hands, Feet or Eyes, $15,000 Double Indemnity (or)
$ 5,000	Cash, & $400 monthly first 2 years, $300 monthly thereafter. Adjusted benefits for disabilities occurring after age 60.

SPECIAL FEATURES

No Cancellation Clause,—Standard Provision 16

No Terminating Age,—Standard Provision 20

No Increase in Premium,—Once Policy is Issued

Grace Period 15 Days

Non Pro-Rating,—Standard Provision 17

Non-Assessable,—No Contingent Liability

Non-Aggregate,—Previous Claims Paid do not limit Company's Liability

Unusually Complete Protection

- ★ Pays Monthly Benefits from 1st Day to Life.
- ★ Pays Benefits for both Sickness and Accident.
- ★ Pays Lifetime Benefits for Time or Specific Losses.
- ★ Pays Regular Benefits for Commercial Air Travel.
- ★ Pays Benefits for Non-Disabling Injuries.
- ★ Pays Benefits for Non-Confining Sickness.
- ★ Pays Benefits for Septic Infections.
- ★ Pays Whether or not Disability is Immediate.
- ★ Waives Premiums for Total Permanent Disability.
- ★ Renewal is guaranteed to individual active members, except for non-payment of premium, so long as the plan continues in effect for the members of your designated organization.

"Premarin"—a naturally occurring conjugated estrogen which has long been a choice of physicians treating the climacteric—is earning further clinical acclaim in the treatment of functional uterine bleeding.

The aim of estrogenic therapy in functional uterine bleeding is to bring about cessation of bleeding, and to produce subsequent regulation of the cycle. Once hemostasis is achieved, the maximum daily dosage of "Premarin" must be continued to prevent recurrence of bleeding. This schedule forms part of cyclic estrogen-progesterone treatment for attempted salvage of ovarian function.

"Premarin" contains estrone sulfate plus the sulfates of equilin, equilenin, β-estradiol, and β-dihydroequilenin. Other α- and β-estrogenic "diols" are also present in varying amounts as water-soluble conjugates.

"PREMARIN"®

Estrogenic Substances (water-soluble)
also known as Conjugated Estrogens (equine)

Four potencies of "Premarin" permit flexibility of dosage: 2.5 mg., 1.25 mg., 0.625 mg., and 0.3 mg. tablets; also in liquid form, 0.625 mg. in each 4 cc. (1 teaspoonful).

War May Hit YOU Twice, Doctor!

1. Uncle Sam won't let you force collection of debts owed you by patients who go into the armed services. You may lose substantially if you fail to act fast to get in money owed you by service-age men and women.

2. If you enter the armed forces yourself, you will need to leave your collections in reliable hands.

In either case, we suggest you check this outline of our service, then fill out and send us the request in the square below.

Here's How the I.C. System Works...

When a patient's bill becomes delinquent you fill out and mail a simple form. We then start a series of procedures designed to induce the patient to pay you *directly* what he owes you. **Note that this is not a collection agency.** The patient pays *you*. Throughout the collection, every effort is made to keep the patient's goodwill and to deflect from you the onus of asking for money. When you have received your money, not before, you remit to us a fee which is less than you would have spent to collect the money through your own efforts and which is approximately half of a collection agency fee. More than 1,000 doctors, hospitals and clinics are already using and can verify the worth of this tested system with the five unique advantages.

5 Unique Advantages

- **It gets the money to you**
- **It keeps patients friendly**
- **It safeguards your own professional dignity**
- **It's a low cost service**
- **It is a reliable service—not a collection agency**

SIGNIFICANT DEVELOPMENTS IN BLUE CROSS AND BLUE SHIELD

ARTHUR M. CALVIN
Executive Director, Minnesota Hospital Service Association,
Minnesota Medical Service, Inc.
Saint Paul, Minnesota

HOSPITAL and medical care are never static. During the past fifty years we have witnessed the greatest advancements in medical science, and development of hospitals. Advances in medical science have made it possible to prevent many diseases and to increase materially the efficiency of diagnosis and treatment of many acute illnesses. Patients are hospitalized for shorter periods and lives are being saved.

The functions of hospitals are broadening. Many illnesses not heretofore hospitalized are now treated in hospitals. More and more physicians are using hospitals for diagnostic purposes as well as for treatment. General hospitals are being used for the short-term treatment of special diseases such as tuberculosis, nervous and mental illness, contagious diseases, and many types of chronic conditions. The public health aspect of hospital service and health education is taking on greater importance. Hospitals conduct educational programs for their professional staffs, technicians, and service personnel. Research is a necessary part of the program of the modern hospital. The expanding sphere of influence which hospitals are assuming is necessarily increasing the nation's hospital bill.

The greatest number of patients are hospitalized in voluntary hospitals for acute short-term illnesses. These hospital bills have always been difficult to pay. They are unpredictable as to time and amount and are usually accompanied by other professional expenses. The patient has little opportunity to plan for a method of payment and frequently suffers loss of income due to absence from gainful employment. The rising cost of hospital care has added to the problem. Every advancement in medical science has increased the cost of hospital care. Better trained personnel, more expensive and extensive scientific equipment, new methods of diagnosis, new measures of therapy, and new drugs, together with increased salaries and wages of hospital personnel and cost of supplies and materials have resulted in higher hospital costs which are reflected in patient charges. Therefore it was necessary to find a way to assist the public in financing their hospital and medical expenses.

Blue Cross

The idea of voluntary group prepayment of the costs of hospitalization is not new in the United States.

Eighteen years ago one of the pioneer group hospitalization plans, since called Blue Cross, was organized in Minnesota by seven hospitals to provide hospital care when needed to employed people, only, on a monthly prepayment method. Later family dependents were added. It was an experiment following the birth of an idea instituted by the Baylor Hospital of Dallas, Texas, in 1929 when an agreement was made with fifteen hundred school teachers. Approximately $800 was donated by these seven Minnesota hospitals for working capital. No statistics were available except that it was known that the average of one out of every ten persons was hospitalized once in ten years.

Presented at the State Convention of The Minnesota Farm Bureau Federation, Saint Paul, Minnesota, January 15-17, 1951.

Voluntary hospitals in the Twin Cities were operating at 60 per cent capacity during the year Blue Cross began. The city and county hospitals were filled to capacity with charity cases. Many voluntary hospitals throughout the country during this depression period were forced to close their doors because of lack of paying patients, increased charity, low occupancy accompanied by personnel who had to be paid, and other overhead costs.

It was not easy to convince the public that hospital care could be purchased at a low monthly rate. Insurance companies refrained from providing this service as such was considered very hazardous, but since Blue Cross showed the way, insurance companies have entered the field.

It was not long before those who purchased Blue Cross in 1933 and who used it for necessary hospital care, told the story to others. In 1935 eight Minneapolis hospitals affiliated with the plan, in 1938 the Duluth hospitals joined, and from there on hospitals throughout the state requested affiliation until today 163 hospitals are affiliated.

Blue Cross subscribers grew—the voluntary hospitals were soon showing increased occupancies, which permitted them to operate on a paying basis. Charity cases decreased and losses on collections became less. Today 1,025,000 people in Minnesota have Blue Cross, or one person out of every three. Since it began over forty-seven million dollars has been paid for the care of subscribers and their dependents; and during the year 1950 approximately ten million dollars was paid for subscribers' hospital care.

This story of Blue Cross growth would not be complete without reference to the active and co-operative help from the Minnesota Farm Bureau Federation. All Blue Cross plans in the beginning were confronted with the problem of how to enroll the farmer. Must it be done individually from farm house to farm house? Such would be costly.

The first farm bureau group was organized by your Mr. Kirkpatrick in 1938. Mr. Kirkpatrick was then county agent for the Hennepin County Farm Bureau. His foresight and interest in solving the problem of bringing Blue Cross to each farm family in Minnesota aroused the interest of your officers and board. To Mr. White, your president, and Mr. Jones, your executive secretary and treasurer, we are greatly indebted for their desire and willingness not only to work out a co-operative program of enrolling all farm bureau members and their families but for their determination that this program was not only a matter of importance to the people of the urban areas but also to the farmers and people in the rural areas. Your organization called Mr. Kirkpatrick to head up a department of Health Services, and through him, your officers and board, and not least your county agents and group leaders, over 30,000 farm families, representing approximately 100,000 farm people, have been enrolled. This is not only a remarkable record but a source of pride to Minnesota Blue Cross. Your organization has led the field and many other states have followed you.

Like Blue Cross plans throughout the country, Minnesota Blue Cross has been confronted from time to time with certain difficulties. When Blue Cross began in 1933 with a group of seven Saint Paul hospitals, its services were limited to a relatively compact area. There were slight difficulties during this time which could quickly be adjusted. In 1935 when Minneapolis hospitals joined the plan, it was still a compact area and one in which any problems arising could quite easily be discussed, considered and adjusted. In 1938 and thereafter when Duluth and other statewide hospitals affiliated with the plan, an important problem in Blue Cross policy and administration for payments to hospitals arose, as charges for services in each hospital were not uniform.

In the beginning, payment to all hospitals was identical. A per diem amount was paid regardless of the number of days care rendered to a subscriber. Because hospitals received different proportions of short stay cases and some hospitals provided care for more costly surgical cases than less costly medical cases, in addition to various rates charged by hospitals for the same type of service, it was necessary to change the method of payment to a percentage basis and to limit the room, board and general nursing service to an indemnity amount.

During the year 1950 a re-study of hospital payments was made and it was disclosed that the percentage basis of payment was not equitable and fair to all hospitals, subscribers and Blue Cross. A temporary payment per diem was placed on the special services provided by hospitals other than board, room and general nursing service. In the meantime two committees were appointed by the board of trustees and an outstanding actuary was secured to assist Blue Cross and the contracting hospitals to arrive at a method of payment which would be fair and equitable to subscribers, hospitals and Blue Cross. An independent self-appointed committee chosen by a group of hospitals also concerned itself with hospital payments.

A meeting of the members of the Association representing all contracting hospitals was held on December 8, 1950, at which they agreed upon a basis of payment which will increase hospital payments approximately 9 per cent over present payments. This method of payment provides, in simple language, a payment of approximately 97 per cent of the hospital's charge for services rendered to Blue Cross subscribers, or 110 per cent of the hospital's operating cost for Blue Cross subscribers care, whichever is less. This was approved by the majority of the members and will become effective March 1, 1951. Increased rates to subscribers will also be made effective at that time to groups other than the farm bureau and other groups whose rates were increased October, 1950, to meet the increased cost of hospital care.

Blue Cross from the beginning developed a service contract rather than an indemnity contract offered by most insurance companies which is limited to cash benefits. An indemnity contract would cause Blue Cross less problems, as the exact amount of payment for subscribers care would be known, and when hospital costs increased Blue Cross would not be confronted with increased payments. However, it has always been the purpose of Blue Cross to provide a service, not a cash indemnity, and to provide its subscribers with as much hospital care as possible at the least possible cost.

Blue Cross has endeavored to keep the rates to subscribers as low as possible in order to serve particularly the lower income groups and to stress voluntary health care as opposed to government controlled care, and consequently found in the rising spiral of costs that from time to time its rates have been inadequate. The majority of the hospitals have understood this and have been patient in giving Blue Cross time to revise its rates and have accepted payment according to the funds available for distribution. It is, of course, understood by everyone that more money cannot be paid out than is taken in.

Blue Cross is seeking to continue its leadership in health service and its influence with the public which is evidenced by over forty million people now covered by Blue Cross throughout the country.

Blue Cross pioneered in coverage for maternity service for which hospital bills for over one million new babies were paid last year by Blue Cross plans. It has provided reciprocity of enrollment with other Blue Cross plans so that a subscriber can transfer from one plan to another without waiting periods, and more recently it has provided reciprocity of service benefits making it possible for a subscriber away from home to receive all of the service benefits of the contract which another plan has negotiated with its hospitals.

During the year 1950 it has organized the Blue Cross Health Service Corporation to make it possible for national concerns to enroll their employes on a national basis with uniform benefits and rates through one organization rather than requiring such firms to enroll their employes in several plans, in which areas their employes are located, at different benefits and rates. Each Blue Cross plan can participate in this national program. The autonomy of the local plan is not lost. Each plan gains in its ability to serve its community by linking itself in this respect with all other plans in the nation.

Financial.—Blue Cross during the first eleven months of 1950 paid out $9,120,500 for hospital care or 88.7 per cent of its income from subscribers. It used only 9.4 per cent for operating expenses, and the balance is to be used for subscribers' future hospital care. Over forty-seven million dollars has been paid to hospitals for subscribers' care since the beginning of the plan.

Minnesota Blue Cross is financially sound. It has $3,145,800 in assets, of which over $2,000,000 is invested in government bonds. It has liabilities of $1,210,300, of which $668,000 or over half of this is for prepaid subscriber payments, and it has available for incompleted and unreported cases a reserve of $700,700, and in addition it has for possible epidemics and other emergencies a reserve of $1,234,800.

It is the purpose to keep the plan financially sound for the benefit of you and other subscribers. It was with this in mind that an actuarial consultant was employed by the Association.

Blue Shield

Blue Shield was organized by the doctors late in the year 1947. Blue Cross subscribers had long felt the need of a medical-surgical plan. Blue Cross co-operated in every way to assist Blue Shield in getting started, and it is generally thought that both plans have been complementary and of value to each other.

Blue Shield, just as Blue Cross, has made great strides in accomplishment during its short period of existence. Over 400,000 people in this state are enrolled. Nearly two million dollars has been paid to doctors for subscribers care during the first eleven months of 1950. Only 10.9 per cent was used for operating expenses.

The lower income groups of people were given increased benefits effective August 1, 1949, by action of the board of directors and the participating doctors who now number over 2,700 in the state. The increased benefits provided for services to all individuals having income of $2,000 a year for subscribers without family dependents and $3,000 a year for subscribers with family dependents.

Blue Shield is also participating in reciprocity of transfers of a subscriber from one plan to another. Blue Shield plans nationally are in the process of organizing a national corporation to provide for coverage to national firms similar to Blue Cross.

Blue Cross-Blue Shield Nationally

At the present time there are eighty-three Blue Cross plans serving forty-seven states and the District of Columbia. Their total enrollment is about forty million. Thus 25 per cent of the total population is enrolled in Blue Cross, paying hospitals at the rate of 400 million dollars annually for subscribers' care. Blue Shield is represented in forty-eight states and the District of Columbia by forty-two plans. Although having started later, they have enrolled approximately eighteen million people and pay doctors at the rate of 100 million dollars annually for subscribers' care.

The accomplishments so far suggest that such strides could not have been made by ordinary means, that behind Blue Cross and Blue Shield is a creative force unique in the history of health insurance.

It is important in appraising these plans to realize that they developed out of the communities themselves, by the hospitals, the doctors, and the people, of which your organization has been most helpful.

You and others have demonstrated that though we live in an age in which the pendulum has swung far over toward concern for the welfare of the group as a whole, toward the demand for security and the minimizing of the importance of the individual, individual initiative and independent voluntary action and freedom still exist.

Last year, for the first time, we offered a Blue Cross and Blue Shield contract to the unemployed and individuals not elegible to form a group. Underwriting of individuals is more hazardous than group underwriting. Experience so far has been satisfactory. The rates for the two non-group Blue Cross and Blue Shield contracts are higher than the group rates and the Blue Cross non-group contract benefits are less than the Blue Cross group benefits. Blue Shield provides the same benefits in the non-group as in the group contract except there are some benefit exceptions in the non-group contract which require a waiting period.

Underwriting Problems

Through the years of trial and error methods, we have accumulated statistics and underwriting information. During 1950 we used this information and supplemented our old enrollment regulations with new regulations, all for the protection of subscribers and the financial soundness of the plan.

It was expected that certain privileges of the plans would be abused, not to any great extent, but to safeguard the majority of subscribers who are fair and considerate, measures had to be taken to prevent a small minority endangering the whole plan.

Our office accounting and billing procedures have been made more efficient to keep the operation costs as low as possible. Your farm bureau groups are now being billed and handled on a businesslike basis similar to the industrial groups.

Conclusion

No story in recent American business has as much high romance as the voluntary nonprofit Blue Cross and Blue Shield plans. The suspense of their crucial and tense periods has all of the

(Continued on Page 140)

APPENDICITIS: FAILURE TO CORRELATE CLINICAL AND PATHOLOGIC DIAGNOSES

A Surgeon's Viewpoint

RALPH L. GORRELL, M.D.
Clarion, Iowa

THE PRIMARY PURPOSE of surgery or any branch of medicine is the cure of the patient. Time and repeated observations permit one to say that the patient is cured.

If clinical cure conflicts with pathologic opinions, what is the truth?

Hospital and surgical certifying boards tend to assume that pathologic diagnoses are exact and scientific, as opposed to clinical diagnoses. If the surgeon cannot persuade the pathologist to agree, the surgeon is automatically wrong, regardless of what happens to the patient.

Pathologic diagnosis is not an exact science; it is the interpretation of gross and microscopic findings by a trained mind, just as x-ray diagnosis is the interpretation of various shadows. If the roentgenologist goes beyond his limitations and attempts to make a complete diagnosis, he is criticized and rightly so. Is the pathologist aware of the limitations imposed by his specialty?

Specimens from the same lesion have been sent to a number of pathologists and various reports received. Does this sound like an exact science?

A boy of seven years suffers from repeated short attacks of crampy abdominal pain followed by nausea. These attacks subside in a few hours. During a quiet phase, the appendix is removed. It is grossly and microscopically negative. The boy is observed for ten years during which time he never has another attack of abdominal pain, he gains weight immediately and is much improved in general health.

Any studious pediatrician, who keeps records over a period of many years, can duplicate this history of a "crippled" appendix, yet many pathologists recognize acute appendicitis only. "Chronic appendicitis as a clinical concept does not have much standing these days. No microscopic criteria of this syndrome are recognized in this laboratory" (University of Minnesota).[2] Is this an exact science or are the criteria too hard to find?

In a study of appendices removed surgically from a group of university students, the pathologic classification used was "acute appendicitis, subacute appendicitis and no diagnosis. . . . In the no diagnosis group, *no attempt was made to follow up these cases to determine the degree of relief experienced.*"[5] Medical literature is already crowded with observations published without follow-up.

Physicians in the middle ages specialized in looking at a specimen of the patient's urine, made the diagnosis by this examination and did not confuse the issue by examining the patient or learning what happened to him.

If only pathologists would realize that the moment of removal of an appendix determines what they will find. The course of appendicitis may run from early catarrhal inflammation through acute suppuration and perforation, or more commonly, to gradual resolution and healing with or without fibrosis and other visible signs. A recurrently disturbing appendix may present no signs visible under *present-day criteria.* Medicine has made many advances; cannot pathology improve its criteria here?

Examination at any one point in the series of events does not permit the pathologist to predict the future or recall the past. This may be done only by correlating the patient's course with surgical and pathologic findings. How often does the pathologist do this? If his criteria are correct, they should be able to stand the test of the patient's subsequent course over a period of months or years, just as they must do in malignant lesions.

The true scientist is humble, ever aware of the probability of error, and thus he learns. The dogmatic pathologist may feel himself beyond error and thus never learn truth. The dogmatic surgeon who feels that he can do no wrong is just as much in error.

To confuse the issue still further is the not uncommon pathologic report of "acute appendicitis" when the appendix is removed incidentally to some chronic, non-inflammatory lesion such as a fibromyoma of the uterus. Either appendicitis is asymptomatic in some cases or pathologic criteria are not clinical criteria. Dennis[1] has stated that he believes appendicitis may be asymptomatic in some cases.

Personally, I have learned that in sending specimens to two different groups of pathologists, one being associated with a medical school and university hospital and the other a recognized pathologist and his assistants in a large city hospital, one must never send any appendix not obviously close to gangrene to one group or the diagnosis of "appendix" will be returned. The other group may report an appendix variously as chronic appendicitis, acute and chronic appendicitis, chronic appendicitis, mild chronic obliterative appendicitis, subacute appendicitis, periappendicitis, acute catarrhal appendicitis and occasionally vermiform appendix. Does this sound like an exact science?

The surgeon, who must send all his specimens to a pathologist non-conversant with clinical problems, must be careful to postpone surgery in appendicitis until acute suppuration has occurred. Appendectomy for mild acute appendicitis or interval operations between attacks of recurrent appendicitis may result in a black mark being placed on his surgical record: appendix, normal appendix, no diagnosis or no acute inflammation found. Dennis[1] has stated that one-half of patients, whose appendices had perforated and could not be removed at time of rupture, were later subjected to appendectomy only to have "normal" appendices at interval appendectomy.

The Pathologists' Rebuttal

The above comments were submitted to several pathologists who were invited to call attention to errors.

"I have read your article with considerable interest. I think that the general impression which you wish to convey is a good one, which you have made clear. I do believe that you are a bit blunt in stating it. I say that for this reason: I do not believe that the failure of correlation is due to any deliberate action on the part of the pathologist† or surgeons, but that it is simply due to a lack of correlated training. The responsibility for that correlated training falls to all of us—to myself, as a head of a department, and to you who have access to the training of young people through editorials. I personally would be more inclined to approach this as an instructive editorial rather than a criticism.

"I agree that appendicitis may be present without symptoms and I also agree that symptoms may be present and the pathologist will not be able to demonstrate the existence of acute appendicitis.

"If both the surgeon and the pathologist would recognize these two facts—and I believe that most of them actually do—there would be no real difficulty.

"If we are then to consider the morbidity and mortality which are the result of delayed appendectomy as compared with the very minor morbidity and mortality of taking out the very normal appendix or one showing only nominal inflammation, it becomes very apparent that it is not an all-or-none procedure. I personally, feel that a good surgeon should be expected to remove between 9 and 11 per cent of appendices in which I cannot in four sections of the appendix demonstrate the existence, of appendicitis. If he runs beyond 11 or 12 per cent, I feel that his surgical judgment might be inquired into. If it runs below 9 per cent, I am sure that we shall find his morbidity and mortality up."[3]

This statement is by the head of a department of pathology. It is a fair statement, very well balanced and thought out.

One of the best-known pathologists in America, long the head of a medical school department and a respected author writes:

"I do not think that pathologists are infallible, but I do believe that when three sections of the appendix made at different levels fail to show any exudate in the walls or lumen, one may say that there are no inflammatory changes in the appendix at time of operation.

"I agree with you that an appendix removed some time after an attack may show no inflammation.*

"I do not agree that an appendix without evidence of inflammation is responsible for any symptoms that the patient may have at that time.‡

"It is unfair of you to state that an appendix must be gangrenous before it is called appendicitis. A large number of appendices are called acute catarrhal appendicitis, i.e., pus in the lumen with little or no extension into the walls.**

"You are not justified in concluding that a normal-appearing appendix caused symptoms because the symptoms disappeared after appendectomy. I have often seen the symptoms disappear when no operation was performed.§

"Many pathologists hesitate to state that no inflammation is present because they do not want to hurt the feelings of the surgeon. I use the term 'No active inflammation'; I do not use the word 'Normal.' I think that this protects the surgeon.

"Every conscientious surgeon occasionally removes a normal appendix, but when five out of six are normal,

(Continued on Page 151)

†Neither did I; I said that the pathologist *wasn't* taking action in determining whether his criteria were correct or not.—AUTHOR.

*Why not consider the clinical history before making the diagnosis?—AUTHOR.

‡No proof given; no evidence of cases followed for years.—AUTHOR.

**Such an appendix is often found incidentally during other abdominal surgery and without any history of appendicitis. Again, there is lack of clinical correlation.—AUTHOR.

§For ten to fifteen years?—AUTHOR.

APPENDICITIS: FAILURE TO CORRELATE PATHOLOGIC AND CLINICAL DIAGNOSES

A Pathologist's Viewpoint

ARTHUR H. WELLS, M.D.
Duluth, Minnesota

DR. RALPH GORRELL'S CRITICISM of pathologists in this issue reflects one of the most important conflicts of our intra-professional life. Consider the following five facts.

1. Appendectomies compose approximately 20 per cent of the major surgery in a general hospital.
2. No trace of inflammatory or obstructive disease can be found in more than 25 per cent of these appendices.
3. The clinical diagnosis of acute appendicitis is one of the most difficult problems in surgery.
4. The normal gross and microscopic anatomic variations in appendices appear almost limitless.
5. A grade of zero in professional ability is a serious insult to the ego, especially where this can be combined with reflections upon one's professional honesty.

These five facts are at the basis of a conflict of clinical versus pathologic diagnoses, which dwarfs all other diagnostic differences of opinion between the surgeon and the pathologist. The pathologist must be willing to accept frequent and sometimes costly criticism and spend extra time and effort in a futile study of each normal appendix, or else, he must adjust his conscience and his classification of normal appendiceal variations so as to mitigate almost certain psychic injury in a colleague.

A discussion of this conflict over the appendix must be divided into at least two parts: (1.) chronic or recurrent appendicitis and (2.) acute appendicitis.

Early in the process of carefully studying some 25,000 appendices during the last twenty years, it became apparent that there was a small but significant number of otherwise normal appendices, which had evidence of chronic obstruction in a proximal part. These appendices had varying degrees of dilatation of their lumina distal to the sites of constriction and frequently contained dried and laminated fecal matter. With or without active inflammatory changes, they frequently occurred in individuals with a history of recurring attacks of right lower quadrant pain. It is conceivable that in the early phases of this proximal obstructive condition in the appendix, the symptomatology of obstruction might manifest itself without significant anatomic alterations recognizable to the pathologist. Similar transient obstructive phenomena probably occur with greater frequency in both the small and large intestines and they may be manifest with the same right lower quadrant and abdominal pains found in appendiceal obstructions.

I seriously doubt whether the number of appendices with obstruction without visible anatomical alteration is very significant. In any case, there should be no clinical evidence of inflammation and a short period of close observation would suffice for the therapy.

It is true that the gross and microscopic examinations of appendices are handicapped in this field of chronic and recurrent appendicitis by the fact that previous inflammatory processes may not leave anatomic changes in the organ. This is probably never the case in a previously ruptured appendix, seldom the case in a severe acute inflammation in the appendix and is not true in the majority of the cases of recurrent attacks of mild inflammation in the appendix. However, this inadequacy of the pathologist's ability to recognize the past in a completely healed organ is of no practical importance in our dispute over classifying the appendix. If the surgeon has removed an "interval" appendix, he is generally not upset by the absence of pathologic findings.

The important source of conflict today is not so much in the clinical fields of chronic and recurrent appendicitis as it was twenty years ago but is in the cases with clinical diagnoses of acute appendicitis. There is nothing mysterious or difficult about acute inflammation in the appendix any more than in any other tissue of the body. One basic fact must be agreed to, and that is, acute inflammation in the appendix sufficient to cause either local or generalized signs and symp-

---

From the Department of Pathology, St. Luke's Hospital, Duluth, Minnesota.

toms will be associated with histologic changes of congestion of vessels, neutrophilic infiltration, and edema of tissues as a minimum histologic alteration. Furthermore, our present methods in pathology of demonstrating acute inflammation in the appendix border upon being too delicate, for they often reveal the tissue reaction due to surgical trauma. It is conceivable that the pathologist could miss an early focal area of inflammation by not taking more than four or five selected sections, but an extensive experience has shown that this is very unlikely. In short, if your pathologist cannot find the signs of acute inflammation in an appendix which was clinically diagnosed as acute appendicitis, another cause of the patient's illness should be immediately sought. He has better than a 95 per cent chance of being right.

It is entirely possible that at least a part of the solution of this problem lies with the diagnostic ability of the individual surgeon. In a review of normal appendices removed in this hospital, it was found that five surgeons who performed almost one-third of the appendectomies in the institution, removed an average of 36 per cent normal appendices, while in the process of removing two-thirds of the appendices all of the other surgeons averaged only 12.9 per cent normal appendices.

In 1928, I reviewed the tissue sections from 100 consecutive appendectomies performed by the late Dr. Arthur E. Hertzler, an ardent surgical pathologist as well as renowned surgeon. To my amazement, there were active inflammatory changes in 100 per cent of these appendices. In spite of this experience and mainly because of the great clinical variations of acute appendicitis, I am convinced that the surgeon should normally remove approximately 15 per cent normal appendices, if he is satisfactorily protecting his patients from the serious complications of this disease.

With rare exceptions, the final diagnosis of "appendicitis" based entirely upon the clinical evidence of disappearance of symptoms following the removal of an anatomically normal appendix can only be explained as inexcusable ignorance of the subject or a form of self dilusion and charlatanry. This practice can become a habit which ultimately leads to a false sense of infallability in all phases of the physician's medical life.

I would like to salute the great majority of surgeons who demand straightforward, honest, pathologic diagnoses of their excised appendices. This permits them quickly to discover the true cause of their patients' illnesses. They can also carefully evaluate the importance of the wide variety of abdominal complaints to which man is subject and spare their patients a great number of unnecessary operations.

BLUE CROSS AND BLUE SHIELD

(Continued from Page 136)

elements of great conflict. The times of despair have been many and the periods long.

Yet Blue Cross and Blue Shield have set new and higher marks of greater service to more people year by year, providing freedom of choice of hospital and doctor, freedom to participate voluntarily or not, without governmental financial support or compulsion.

What the future may hold for these voluntary plans is impossible to answer. It is difficult, however, not to be genuinely optimistic when we consider what has been accomplished.

We are truly grateful to the wisdom, the integrity, and the judgment of your organization, the hospitals, the doctors, the trustees and directors of these plans who serve without monetary compensation, and to the many other civic minded individuals and organizations who believe that hospital and medical care can be provided to our people voluntarily and with the least amount of government control.

THE DANGERS OF PENICILLIN THERAPY IN SYPHILIS OF THE CENTRAL NERVOUS SYSTEM

With Special Reference to the Occurrence of Delayed Reactions

SIDNEY K. SHAPIRO, M.D. AND BARNET BERRIS, M.D.

Minneapolis, Minnesota

WITHIN recent years, penicillin has become widely used in the treatment of central nervous system syphilis. Because of its efficacy in so many diseases and its relative ease of administration, the toxicity of this drug is frequently overlooked and the dangers of its use not fully appreciated. This is particularly true in central nervous system syphilis, where the dangers of toxic reactions from the use of penicillin are ever present.

TABLE I.

Case	Sex	Age	Diagnosis	Reaction to Penicillin		
				Day of I. V. Therapy	Maximum Temperature (degrees F.)	Associated Symptoms
1	M	41	Chronic encephalitis	2	101.4	
2	F	17	Wilson's disease	3	102.5	
				7	102.	Headache, malaise, chills
				8	102.5	
3	M	46	Psychoneurosis	6	102.4	Chills
4	M	50	Ruptured intervertebral disc	No reaction		
5	F	64	Metastatic carcinoma to brain	No reaction		
6	M	71	Cerebral thrombosis	No reaction		

In an effort to avoid such toxic reactions and still produce a high concentration of penicillin within the central nervous system, a schedule of therapy was devised, consisting of gradually increasing intramuscular doses of penicillin, supplemented after the fifth day by larger doses of the drug intravenously. Ten patients with neurosyphilis, as well as one patient with tertiary syphilis of the skin, were treated according to this schedule. The late occurrence of reactions in eight of the patients, two of whom subsequently died, prompts this report and serves to underwrite the need for caution in the use of this drug in the treatment of syphilis of the central nervous system. In an effort to elucidate the nature of these delayed reactions, a control series of six nonsyphilitic patients was treated in a similar manner.

Clinical Study

Crystalline Penicillin G was used throughout this study. During the first five days the drug was injected intramuscularly in increasing doses, according to the following schedule: on the first day, 5000 units every three hours; on the second day, 10,000 units every three hours; on the third day, 20,000 units every three hours; on the fourth day, 50,000 units every three hours, and commencing on the fifth day and for the remaining ten days of the treatment course, 100,000 units every three hours. From the fifth to the fourteenth day inclusive, an additional 1,000,000 units of penicillin dissolved in 500 c.c. of normal saline was administered daily intravenously in a sixty-minute period. Thus, a total dosage of 8,680,000 units intramuscularly and 10,000,000 units intravenously was administered. This course of treatment was modified only in those cases developing severe reactions.

The occurrence of toxic reactions using the above schedule in individual cases led to the administration of a similar course of therapy to six non-luetic patients as a control group (Table I), in order to determine whether these reactions were specific for individuals with central nervous system lues.

Results

Eight of the eleven luetic patients demonstrated toxic reactions (Table II). In no instance was a toxic reaction manifested prior to the institution of intravenous penicillin, and thus all reactions encountered were delayed in type. There was an extreme variability as to the day of intravenous penicillin therapy on which the reactions occurred,

From the Division of Neurology, University of Minnesota Medical School.

toxic symptoms being encountered on every one of the ten days. Six of the eight patients had reactions following two of the intravenous infusions, while the other two patients had only one reaction. All the patients with toxic symptoms complained of malaise, headache, nausea, chilly sensation and demonstrated temperature elevation. Two patients in addition had exacerbation of luetic symptoms; in one, the skin lesions flared (Case 1) and in another there was a recurrence of severe lightning pains (Case 2). Two of the patients succumbed after the institution of therapy (Cases 3 and 4).

TABLE II.

Case	Sex	Age	Diagnosis	Reaction to Penicillin		
				Day of I. V. Therapy	Maximum Temperature (degrees F.)	Associated Symptoms
1	F	57	Tertiary lues of skin Subacute combined degeneration	See Case Report 1		Chills, nausea, vomiting, skin lesions flared
2	M	51	Tabes dorsalis	See Case Report 2		Chills, fever, exacerbation of lightning pains
3	M	56	Taboparesis	See Case Report 3		Fatal termination
4	M	62	Paresis	See Case Report 4		Fatal termination
5	M	60	Tabes dorsalis	7	102.4	Chills, vomiting, rash
6	M	60	Paresis	4	101.8	Chills
				10	102.4	Urticaria
7	M	53	Taboparesis	8	100.4	Headache
8	M	44	Paresis	2	103.6	Chills
			Chronic alcoholism	3	103	Chills
9	M	39	Paresis	No reaction		
10	F	24	Asymptomatic neurosyphilis	No reaction		
11	M	38	Taboparesis	No reaction		

Three of the six control patients demonstrated systemic reactions—headache, malaise, chilly sensation and fever.

In all but Case 4, the onset of the reaction followed the termination of the intravenous penicillin by one to three hours, and in the nonfatal cases and controls, lasted twelve to seventy-two hours.

Case Reports

Case 1.—E. E., a woman aged fifty-two, complained of numbness of the feet and legs and stumbling in the dark of six years' duration.

Physical examination revealed the following positive findings: ringed, raised nontender skin lesions on the flexor aspects of both forearms, absent vibration and impaired position sense in both lower extremities, absent ankle jerks and positive toe signs on the right.

Laboratory investigation revealed a macrocytic anemia of 11 grams and a megaloblastic bone marrow. The blood serology was 4-plus. The spinal fluid was normal. Skin biopsy of one of the lesions on the arm disclosed "granuloma compatible with syphilis."

A diagnosis of pernicious anemia with subacute combined degeneration of the cord and tertiary syphilis of the skin was made. The patient was treated with 10 units of crude liver extract intramuscularly daily, and had a maximum reticulocyte response of 8 per cent on the ninth day of therapy. A repeat bone marrow sixteen days after commencement of treatment revealed normoblastic erythropoiesis. Penicillin was then administered as luetic therapy in the dosage given in the text of the paper. No secondary reticulocyte response was noted. On the first day of intravenous penicillin, the patient noted chills, fever, nausea and vomiting, which began two hours after the intravenous had been discontinued and persisted for several hours. The maximum temperature elevation was 103.2° F., returning to normal in twelve hours. The next four days no penicillin was given, and on the fifth day another million units of penicillin was given intravenously. Systemic symptoms and fever were again noted, but subsided shortly and did not recur for the rest of the treatment course. Nine days after the onset of intravenous penicillin, the skin lesions were found to be redder and more raised, and repeat skin biopsy revealed an increase in the amount of edema present.

Comment.—This patient demonstrated a delayed reaction to penicillin characterized by systemic symptoms and exacerbation of luetic skin lesions.

Case 2.—A. S. was a fifty-one-year-old man who entered the hospital complaining of shooting pains in his legs of eleven years' duration. A diagnosis of syphilis had been made at the age of twenty-one years.

Physical examination was negative except for diminished deep tendon pain in both legs. The blood serology was positive. Spinal fluid serology was negative.

Penicillin therapy was commenced, and on the third day of treatment he received in addition 3 grams of tryparsamide intravenously. This was followed by chills, fever to 103.4° F., emesis and lightning pains. This reaction persisted for twelve hours. No further tryparsamide was given, as the reaction was attributed to this drug. Penicillin was continued, however, and two hours after the fourth intravenous penicillin infusion was completed, the patient experienced a reaction similar to that produced by the tryparsamide. Following the sixth intravenous infusion, a similar reaction occurred, and treatment was terminated.

Comment.—Two reactions following intravenous penicillin identical with the one following tryparsamide therapy, occurred in this patient. There was exacerbation of lightning pains in addition to systemic symptoms.

Case 3.—U. H., aged fifty-six, was admitted to the University Hospitals on January 23, 1948. The history could not be obtained because of the mental state of the patient and the absence of an informant. A diagnosis of taboparesis was made on the basis of the following positive findings: The patient was disoriented with respect to time, place and person and demonstrated marked impairment of memory. The pupils were irregular, constricted and did not react to light or on accommodation. The hearing was decreased bilaterally. There was bilateral paresis of the lower extremities. The tendon reflexes in the lower extremities were absent, and the toe signs were positive. In the lower extremities deep pain, vibration and position sense were markedly impaired. The spinal and blood Wassermann were 4-plus and the spinal fluid had a paretic gold curve.

Penicillin therapy was commenced. One hour after the first intravenous dose had been given on the fifth day of therapy, the patient complained of chilliness and became nauseated and vomited. His oral temperature rose to 100.5° F. Following this reaction the patient's clinical condition deteriorated. His confusion increased. It became necessary to restrain him in bed. The temperature elevation persisted. On the sixth treatment day the second million units of penicillin were given. The patient's temperature remained elevated, reaching 103.5° by rectum on the eighth treatment day. At this time because of the deterioration in this man's clinical condition and the persistent fever, all penicillin was discontinued. His clinical condition failed to improve but the temperature gradually subsided and reached normal three days after cessation of therapy. Three days after the temperature had returned to normal, intramuscular penicillin was recommenced in doses of 50,000 every three hours and the next day dosage was elevated to 100,000 units every three hours. Six days after therapy had been recommenced the temperature once more rose. Penicillin therapy was discontinued seven days later. The hyperthermia persisted until the death of the patient on April 21, 1948.

Comment.—The patient's clinical condition deteriorated markedly after the reaction to his first intravenous dose of penicillin. When penicillin therapy was recommenced by intramuscular method, fever recurred.

Case 4.—U. H., a man aged sixty-two, dated the onset of his symptoms to March, 1945, when he developed a right-sided hemiparesis and dysarthria. On his admission to the University Hospitals, a diagnosis of paresis was made on the following positive findings: He had marked dysarthria and dysphagia; his memory was impaired; the pupils were small and irregular, reacting poorly to light and accommodation. There was a right hyperreflexia and hemiparesis. The patient had urinary and fecal incontinence. The blood and spinal fluid revealed 4-plus Wassermann reaction. The spinal fluid had a first zone colloidal gold curve.

The patient had received no previous antiluetic therapy. Penicillin therapy was commenced according to the schedule. On his fifth hospital day, after receiving a portion of his first million units of intravenous penicillin, the patient had a chill and a subsequent oral temperature elevation to 100° F. The intravenous penicillin was omitted on the sixth hospital day. The fifth dose of intravenous penicillin was given on the tenth hospital day. On this day the patient had aspirated some vomitus, and a tentative diagnosis of atelectasis of the right lower lobe was made. Postural drainage and repeated bronchoscopy were used in treatment of this complication. The temperature ranged from 100° to 103° F. for the next three days and then returned to normal on the thirteenth hospital day. The sixth dose of intravenous penicillin was given on the thirteenth hospital day. When half of the intravenous had been given the patient experienced a severe chill with a temperature elevation to 105.5° F. by rectum. The patient's condition continued to deteriorate. Hyperthermia persisted and after two more days of intramuscular penicillin, all penicillin was discontinued until the seventeenth and last day of the patient's hospital stay. At this time intramuscular penicillin was recommenced. The patient expired on the seventeenth day of his hospitalization.

Comment.—The pulmonary complications make the exact role of penicillin in the demise of this patient difficult to assess. However, on two occasions the patient reacted to the intravenous penicillin, and following the patient's last severe reaction, his condition deteriorated rapidly.

Comments

The rationale behind the use of intravenous penicillin therapy to achieve an effective therapeutic penicillin level in the central nervous system is supported by recent investigations. Boger and Wilson[1] administered 500,000 units of penicillin intravenously rapidly to twenty-one paretics, and eighteen of these had significant levels of penicillin in the cerebrospinal fluid. No toxic reactions were reported. Schwemlein and his associates[6] administered to patients with primary or secondary syphilis ten to twenty-five million units of penicillin by intravenous drip over a twenty-four-hour period and also found significant levels of penicillin in the spinal fluid. Toxic reactions were encountered in some patients during the treatment period.

In an effort to minimize the dangers of Herxheimer reactions, Moore and his associates[3] initially advocated gradually increasing intramuscular doses of penicillin. In subsequent work,[4] however, they cast doubt on the rationale of this mode of penicillin administration and suggested that the Herxheimer reaction is an all-or-none phenomenon. They found that it did not occur below a minute threshold dose of approximating 5 units per kilogram of body weight. Above this level and with doses ranging from 10 units per kilogram to 120,000 units per kilogram it occurred with essentially equal frequency.

In our series, including controls, reactions occurred only after administration of intravenous penicillin. It is possible that the increasing intramuscular dosage of penicillin which preceded intravenous therapy served to sensitize the patients to penicillin and accentuated the reactions encountered. Another mechanism to be considered is that symptoms were due to a direct neurotoxic effect of penicillin. Several reports[2,8,9] have been published clearly demonstrating that penicillin may cause irritative phenomena when given intracisternally, intraventricularly, intrathecally or by direct local application of concentrated solutions to the cerebral cortex. In support of the above mechanisms is the fact that delayed reactions occurred in the control group. However, in four of the luetics there was an exacerbation of specific luetic symptoms, and this would suggest that in these cases at least another mechanism was operating, separately or in combination with the above.

There are numerous references in the literature to the occurrence of toxic reactions to penicillin within twenty-four to forty-eight hours after the onset of therapy.[3,4,6,7] These include sudden intensification of somatic or psychotic symptoms, convulsions, coma, focal vascular accident, excitement, confusion, mania, hallucinations, exacerbation of lightning pains and transverse myelitis. In addition, Rose and his group[5] reported a fatal termination following intramuscular penicillin therapy in two patients in the terminal stages of general paresis.

Moore and his group[4] believe that in general paresis penicillin therapy alone is contraindicated because of the severe Herxheimer reactions encountered, and they recommend that penicillin be used only after several malaria chills have occurred.

In these reports the occurrence of delayed reactions has not received special mention. Although it is interesting to speculate about the nature of these delayed reactions, it is apparent that their severity contraindicates the use of combined intramuscular and intravenous penicillin as outlined in the treatment of neurosyphilis.

Conclusions

1. Ten cases of neurosyphilis, one case of tertiary syphilis of the skin, and six nonluetic patients were given a combination of graded intramuscular doses of penicillin and subsequent large doses of intravenous penicillin.

2. Delayed reactions were encountered in eight of the luetics and three of the control group. Two of the patients succumbed after the institution of penicillin therapy. These reactions contraindicate the further use of the schedule employed.

3. Possible explanations for the delayed reactions are discussed.

PERIPHERAL NEURITIS DUE TO POLYCYTHEMIA VERA

WILLIAM CHALGREN, M.D., Ph.D.
Mankato, Minnesota
and
D. R. JOHNSON, M.D.
Cambridge, Minnesota

THE symptomatology of polycythemia vera is exceedingly protean. Symptoms referable to the nervous system, the cardiovascular system, the gastrointestinal tract, the extremities and elsewhere occur both singly and in various combinations. These symptoms are due to the marked vascular engorgement which results from the overproduction of blood cells in the bone marrow. There is a decrease in the blood velocity and an increase in the viscosity, leading to circulatory insufficiency and thromboses.

Two cases of generalized peripheral neuritis secondary to polycythemia vera have been studied at the University of Minnesota Hospitals. Since this complication is rather rare, it is worthy of special mention.

Case 1.—Amanda L., a fifty-year-old Scandinavian housewife, was admitted to the hospital December 12, 1944, for investigation of a progressive paralysis of her arms and legs. Her illness began a year previously with weakness of the legs accompanied by numbness and tingling sensations of the feet. Six months later the same symptoms involved her arms. The weakness gradually progressed to almost complete paralysis of her hands and feet. This was accompanied by atrophy of the hands and feet and severe weakness of the proximal musculature of the arms and legs. She also complained of a dusky cyanosis of the skin, progressive hirsutism of the arms, legs and face, heat intolerance, irregular menstrual periods, a 35 pound weight loss, and a full feeling in her head.

Examination revealed an emaciated woman of normal intellect. The skin of the whole body was a dusky red color. The liver and spleen were enlarged, and a small pelvic mass was palpable. The blood pressure was 148/78. Neurological examination showed a severe peripheral neuritis with absent reflexes and weakness of all muscle groups in the arms and legs, most marked distally. There was atrophy of the distal muscles and both wrist and foot drop. There were early contractures in both hands. A decreased perception of all sensation in the hands and feet was noted. The cranial nerves were normal.

Laboratory studies revealed a polycythemia with a hemoglobin of 18.4 grams, a red cell count of 5,510,000 cells per cu. mm. and a hematocrit of 57 per cent. The blood volume was 7.9 liters, against a calculated normal of 4.2 liters. The spinal fluid was normal except for a pressure of 27 mm. of mercury. The basal metabolic rate was plus 40. Liver and kidney function tests were essentially normal. The glucose tolerance curve was normal. The Wassermann was negative. A chest x-ray revealed a diffuse fibrosis of the lungs consistent with a diagnosis of polycythemia. Skull x-rays disclosed a small calcification lateral but near to the pineal gland.

The case presented an interesting diagnostic problem and extensive studies were obtained. The diagnosis of polycythemia was obvious; the findings as above were repeated on several occasions. Psychometric tests revealed suggestive organic brain deterioration, although there was no clinical evidence of this. Ketosteroid excretions were low. An exploratory laparotomy was performed and an enlarged uterus with myomata was removed. No abnormal masses were found in the region of the adrenals or ovaries. After several weeks of hospitalization the development of bilateral choked discs of 0.5 diopters was observed. The spinal fluid pressure remained elevated despite the fact that the blood volume was reduced to near normal by venesection. A ventriculogram was performed to further investigate the continued increase in spinal fluid pressure and the calcification near the pineal body. No pathology was observed.

The patient's course remained the same despite continued physiotherapy, a high protein-high caloric diet, vitamins, liver, stilbestrol, and many repeated venesections. The diagnosis continued to be that of polycythemia vera complicated by a severe peripheral neuritis, bilateral choked discs, elevated basal metabolic rate, hirsutism and an intracranial calcification. She was discharged after six months of treatment in essentially the same state as she was on admission.

Case 2.—Freda H., a thirty-six-year-old German-Indian housewife, had noted a gradual onset of weakness in the arms and legs six months prior to hospitalization. She had also noted an increasing pigmentation of her skin for the past year and a 30 pound weight loss over the same period. She had not been able to walk for the previous three weeks. She complained of numbness and tingling of her hands and soles and of sharp shooting pains in her right arm of seven weeks' duration.

Examination on admission revealed a thin woman with a deeply pigmented skin. There was a generalized lymphadenopathy and the spleen and liver were enlarged. Neurological examination demonstrated a marked peripheral neuritis with weakness and atrophy of the muscles

---

Dr. Chalgren is clinical assistant professor of neuropsychiatry, University of Minnesota.
Dr. Johnson is associated with the State Colony for Epileptics, Cambridge, Minnesota.

of the extremities most severe distally, with wrist and foot drop and with absent deep reflexes. Deep sensation from the extremities was impaired and hyperesthesias of the arms and legs and feet were noted. The fundi showed a suggestive choke bilaterally, with some retinal exudates and a moderate sclerosis of the vessels.

Laboratory studies revealed a hemoglobin of 18.5 grams, with 6,190,000 red blood cells per cu. mm. and a hematocrit of 60 per cent. The white blood count was 13,000. The serology was negative. A glucose tolerance test revealed a diabetic type of curve without glycosuria. The basal metabolic rate was plus 42. Bone marrow studies were consistent with a diagnosis of polycythemia. Liver function and other special tests were normal. Spinal fluid studies revealed a pressure of 18 mm. of mercury and a protein of 86 mgms. per cent. A mild first zone colloidal gold curve was present. Chest, skull and other x-rays were negative.

A diagnosis of polycythemia vera complicated by a peripheral neuritis was made. The polycythemia was treated by repeated venesections. Physiotherapy and high doses of vitamin B complex plus a high protein-high caloric diet were given for the neuritis. The patient remained about the same for four months. She then developed periods of abdominal pain accompanied by nausea and vomiting. She suddenly expired during one of these episodes. A mesenteric vein thrombosis was suspected as the cause of death. Autopsy was not permitted.

Comment

The striking similarity between these two cases is at once evident. Both patients had severe generalized peripheral neuritis and definite polycythemia. In each case the spinal fluid pressures were increased, and papilledema was present. The basal metabolic rates were elevated. Each had cyanosis and increased pigmentation of the skin and an enlarged liver and spleen. Neither patient improved after restoration of normal blood values.

Cases of multiple neuritis with polycythemia are rare, despite the fact that subjective complaints of numbness and tingling in the hands and feet are common. Fifteen per cent of 163 cases collected by Tinney, Hall and Giffin[14] had complaints of paresthesias of the extremities. Dameshek and Henstel[5] found paresthesias in twelve of twenty patients, and Adams[1] noted that they were a principal symptom in four of nine patients. These symptoms almost always disappear under treatment. Sturgis,[13] for example, had a patient who could always tell when to return for additional therapy because of the reappearance of numbness in the hands and feet.

Actual weakness and atrophy from a generalized neuritis has been recorded only a few times. Crosetti[4] reported a case in which there was a progressive atrophy of the hands and feet due to peripheral nerve involvement. The patient also had chorea. Christian[3] found a toe drop in one of his patients, and Lhermitte[9] noted peripheral atrophy as an infrequent complication.

A brachial plexus neuritis with polycythemia has been described by Meyer,[11] and Fetterman and Spitler[6] published a case in which there was a mononeuritis in the leg. The latter authors suggested that the peripheral nerve symptoms were caused by an ischemia of the nerves secondary to engorgement and thromboses of the vasa vasorum.

Pains in the limbs are not uncommon in polycythemia, but they seldom resemble rootlet or nerve pain. Diffuse pain in the bones and muscles may be due to local tissue engorgement or to pressure from the medullary cavities of the bones (Gaisbock[7]). Pain and hyperesthesias secondary to peripheral vascular disease are frequent (Brown and Giffin[2]). The classical symptoms of intermittent claudication may be present. Erythromelalgia is diagnosed when there is a sensation of burning in the feet associated with an increase in the surface temperature. Acroparesthesias, in which the burning sensation is not associated with an elevated skin temperature, are equally frequent. In both conditions the sensations of numbness and tingling may be prominent. In some cases the symptoms may closely resemble Raynaud's or Buerger's disease (Dameshek and Henstell[5]).

Other Neurological Complications.—Neuropsychiatric symptoms are actually the most common of all symptoms observed in this disease (Johnson and Chalgren[8]). They are present in 80 per cent of the cases. In 35 per cent of the cases they are the initial or most important complaint. Headache, vertigo, fatigue and weakness are frequently noted. Visual disturbances such as blurring of vision and scotomata are almost as common. The occurrence of paresthesias has already been noted. Attacks of syncope may be present and grand mal seizures have been described in a few patients. Often there are multiple vague symptoms suggesting a diagnosis of psychoneurosis. Such a diagnosis may especially be considered when symptoms of lethargy, irritability, insomnia, lapses of memory, and nervousness are prominent. Occasionally a definite depression or a picture resembling psychosis with cerebrovascular arteriosclerosis is present.

Contrasted with these vague complaints are focal symptoms indicating involvement of certain cerebral centers. Definite vascular thromboses occur in 20 per cent of the cases of polycythemia. Hemiplegias, with or without aphasia and visual field defects, most frequently result. Extrapyramidal system symptoms such as chorea and tremor have been noted. Hemihyperesthesia and thalamic pain may occur.

Diencephalic symptoms, including narcolepsy, obesity, diabetes insipidus and attacks of chills and fever may occasionally occur. The reverse situation, in which a polycythemia appears to be secondary to some diencephalic lesion such as a tumor or encephalitis is somewhat more common. This has led to the postulation of a cerebral center for the regulation of erythropoiesis. Though there are many case reports which suggest such a relationship the matter has not yet been adequately investigated.

Choked discs and an elevated spinal fluid pressure are not uncommon. Transient periods of blindness were described as early as 1838 (Loman and Dameshek[10]). In almost all patients there is an engorgement and cyanosis of the retinal veins. Hemorrhages may be present. The vertigo which is such a frequent complaint is often accompanied by nausea and vomiting, falling, tinnitus and hearing loss, simulating a Ménierè's syndrome.

These focal lesions generally occur as the result of vascular thrombosis. Occasionally they are caused by hemorrhage. Subarachnoid and subdural hemorrhage as a complication of polycythemia is infrequent but such a possibility should not be ignored in a differential diagnosis. The nonfocal symptoms are thought to be due to temporary anoxemia of the brain secondary to the slow circulation. Some of the symptoms are likely due to the tremendous congestion which expands the brain within the fixed cranial cavity. The important characteristics of the cerebral symptoms are that they are frequently multiple and that they may occur repeatedly, often followed by complete recovery. When definite tissue destruction occurs, however, there is no recovery.

Errors in Diagnosis.—The clinical picture of polycythemia vera contains a number of features which easily permits errors in diagnosis to be made. The onset is characteristically insidious. The symptoms may be present for several years before the diagnosis becomes evident. The plethoric facies which provides the usual clue to the diagnosis is often not evident for some time. A routine blood analysis may show values at the upper limits of normal and further studies may not appear indicated.

The symptomatology is usually vague and indefinite. Since nervous symptoms predominate patients are quite apt to be given a diagnosis of some functional disease. This has frequently occurred. Patients may be so diagnosed for years, until the physical signs of the disease become striking or until some obvious vascular thrombosis occurs.

Symptom complexes resembling migraine or Ménierè's disease are particularly frequent. Polycythemia should always be considered as an etiology in these conditions.

Similarly the possibility of the presence of polycythemia should never be ignored when a patient suffers from a "stroke." One should be on guard when there is a history of several strokes with subsequent recovery and when there is evidence of thrombosis in more than one vessel. Multiple and transient cerebrovascular accidents are typically seen in polycythemia. The diagnosis is further complicated because polycythemia occurs in that age group in which cerebral vascular pathology is likely to be present. There is also evidence that polycythemia hastens the progress of arteriosclerotic disease (Norman and Allen[12]). Careful examinations will usually establish the correct diagnosis. It should be kept in mind, however, that a stroke can occur as one of the first manifestations of the disease and that the other signs of polycythemia develop later.

In a few cases the symptoms closely resemble those of a brain tumor. In these cases the focal symptoms are striking, the course is progressive, and there is a choke and an increased spinal fluid pressure. Cranial explorations have been done in a number of cases. In some the symptoms have so convincingly suggested a tumor that exploration has been performed despite the knowledge that the patient was suffering from polycythemia. The reverse situation, in which polycythemia is secondary to a brain tumor may occasionally occur. In most of these cases the polycythemia ap-

TRAUMA TO URETHRA AND BLADDER IN ASSOCIATION WITH PELVIC FRACTURES

Edward J. Richardson, M.D.
Saint Paul, Minnesota

THIS presentation today represents an analysis of the cases of bladder and urethral injuries which occurred in association with x-ray-proven pelvic fracture patients admitted to the Ancker Hospital in Saint Paul, Minnesota, between January 1, 1945 and January 1, 1950.

It is felt that this is a representative group of cases, since Ancker Hospital is the City Hospital and receives at least 90 per cent of all accident cases in Saint Paul and Ramsey County.

During this five-year period there were 125 individuals admitted to the hospital with pelvic fracture.

TABLE I. MECHANISM

Automobile accident	90
Fall	26
Railroad accident	2
"Pushed in bar"	2
Crushed in foundry	1
Pinned under trailer	1
Jumped off bridge	1
No history	2
	125

Table I presents the mechanism responsible for these injuries. As you can well see, the automobile heads the list, being responsible for ninety of the 125 cases. Next in frequency is falls, followed by the other causes as listed.

TABLE II. TOTAL CASES

History:	Alcoholic	22	
	Epileptic	1	
	Attempted suicide	1	
	Accidental	101	
	Total	125	
			Per Cent
Sex:	Male	67	53.6
	Female	58	46.4

As shown in Table II, in the series of 125 cases there was a history of alcoholism in twenty-two. One patient was an epileptic and one an attempted suicide. The remaining 101 cases were accidental. As one would expect, the ratio of male to female is about even. Of the patients, sixty-seven were male and fifty-eight were female, giving the percentage figures as listed. The age of these patients covered a very large span. The youngest patient in this series was a two-year-old and the oldest was ninety years of age. Incidentally, both of these patients recovered and neither had any injury to the lower urinary tract.

TABLE III. HEMATURIA

Negative	75 cases	(60.0%)
Microscopic	24 cases	(19.2%)
Gross	17 cases	(13.6%)
Not recorded	9 cases	(7.2%)

Table III gives the occurrence of hematuria in these patients. It is surprising to me that 60 per cent of these patients had neither gross nor microscopic hematuria. The importance of urinalysis in these cases cannot be emphasized too much. Twenty-four of the patients had microscopic hematuria and seventeen had gross hematuria. In nine cases no urinalysis was done. All those with gross hematuria had cystograms and further urologic investigations as indicated.

TABLE IV. BLADDER AND URETHRAL INJURIES

Cases with pelvic fracture	125	
Bladder and urethral injuries	10 (8%)	
Urethral	5	
Bladder	5	
Extraperitoneal rupture		3
Intraperitoneal rupture		2

Ten of the 125 patients (8 per cent) had bladder and urethral injuries (Table IV). In reviewing the literature, it appears that this figure of 8 per cent represents about the average throughout the country.

In 1944, McCague and Semans[1] of Pittsburgh reviewed 780 cases of pelvic fracture over a thirty-eight year period and found 133 cases, or 17 per cent, with injury to the urethra or bladder. They stated that 17 per cent was a high incidence, but explained this high incidence on the fact that their cases came from a very industrialized community where severe crushing injuries were quite common.

In these ten patients with urinary tract injury, five had injury to the urethra and five had injury to the bladder. Of these five with injury to the bladder, three had extraperitoneal rupture and two had intraperitoneal rupture.

The two most frequent findings in this group of patients are shock and pain on movement of the

---

Read before the annual meeting of the Southern Minnesota Medical Association, Mankato, Minnesota, September 11, 1950.

lower extremities. Both may be quite severe. In addition, there is usually abdominal tenderness, rigidity and hematuria. All patients with pelvic fracture should be suspected of having urinary tract injury until proven otherwise. Immediate microscopic examination of the urine is indicated in all cases. If the patient is unable to void, catheterization is indicated and necessary. However, if a catheter cannot be passed, then the cystogram, or cysto-urethrogram can be made by injecting contrast medium through the urethra using an asepto syringe.

The diagnosis can be made from the physical findings and x-ray—either a cystogram or cysto-urethrogram with or without the use of a catheter. However, before any of these studies are made the most important thing is first to treat the shock.

With the modern advances in x-ray technique, one should never try to establish a diagnosis of lower urinary tract injury by injecting a measured amount of solution through a catheter and then measuring the amount recovered. This may frequently lead to a false sense of security. It should be added that if in making the cystogram or cysto-urethrogram a definite diagnosis cannot be made from the anteroposterior view, then oblique views and an anteroposterior view after emptying are indicated. Rarely, if ever, is cystoscopy indicated unless it appears absolutely necessary to rule out the upper urinary tract as the source of hematuria.

In those cases in which there is urethral injury, I feel that if it is possible to pass a catheter through the urethra into the bladder, then that is all that is necessary as long as the catheter is in good functioning position. If there is any evidence of extravasation of urine, then the extravasated areas should be incised and drained. However, in those cases of urethral injury in which there is complete rupture of the urethra, then in all likelihood it will be impossible to pass a catheter through the urethra. If so, a suprapubic cystostomy should be performed, and if possible and if the patient's condition warrants it, retrograde instrumentation so that a splinting catheter can be passed through the urethra and fixed in good functioning position.

In patients with bladder rupture, whether extraperitoneal or intraperitoneal, I strongly feel that these patients should have an operation as soon as their general physical condition warrants. In the cases of intraperitoneal rupture, after the defect in the bladder has been closed and a suprapubic tube fixed in place, drainage of the peritoneal cavity is not indicated unless the patient is known to have had infected urine. In patients with extraperitoneal bladder rupture, a suprapubic tube with drainage of the perivesical spaces, and, if possible, suture of the defect in the bladder is the procedure of choice.

Time will not permit a complete discussion of all the ten cases of lower urinary tract injury in this series. In three of the five cases of urethral injury, it was possible to pass a catheter through the urethra and nothing else was necessary and the patients made uneventful recoveries. In the fourth case, it was thought that the catheter, which had been passed through the urethra, was in good functioning position. However, subsequent x-rays showed that the catheter itself was outside the bladder and lying free in the perivesical space. Once this fact had been determined, the patient was taken to the operating room, although his general condition was not satisfactory. At the operation, it was possible to place a splinting catheter in the urethra by retrograde means and leave a suprapubic tube in the bladder for drainage. However, the patient died on the third postoperative day. This patient had multiple crushing injuries and at the time of autopsy, it was the impression that the patient died from so-called crush syndrome. The fifth patient in this series will be discussed in some detail later.

It should be added that when these patients recover and are discharged from the hospital, they should have frequent postoperative check-up examinations so that any postoperative urethral stricture may be promptly recognized and treated.

In this series of cases, there were five bladder ruptures, two being intraperitoneal and three extraperitoneal. One patient died. This death was about three hours after admission to the hospital and no operation was attempted, although a diagnosis had been made, because the patient's general physical condition would not tolerate surgery. All the other four patients had surgical intervention and recovered.

Figure 1 shows a cysto-urethrogram made on a man who was admitted to the hospital after being hit by a car while crossing the street.

At the time of admission, this patient, a 62-year-old white man, was in a marked degree of shock and was bleeding from the urethra. He was immediately treated for shock and then an x-ray was made which showed a

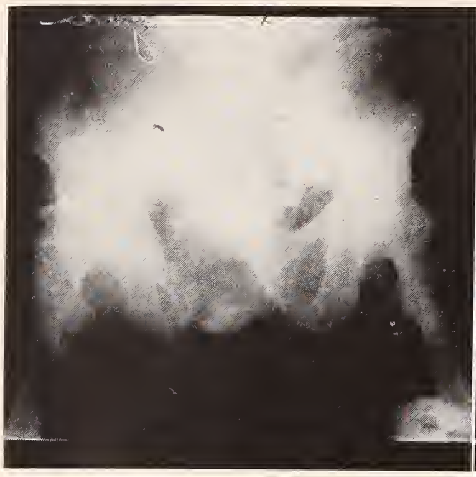

Fig. 1. Cysto-urethrogram taken after contrast medium was injected into urethra, showing medium in membranous urethra and adjacent tissues.

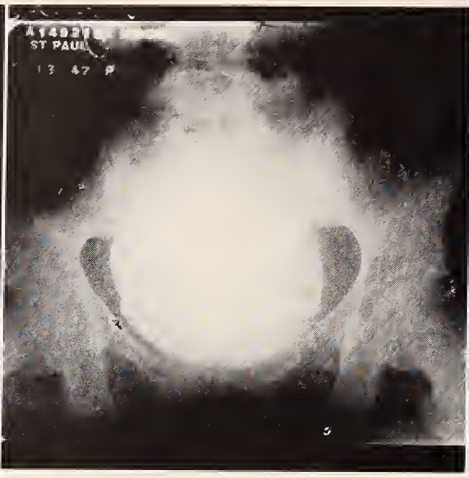

Fig. 2. Cystogram showing extravasation of contrast medium into the left perivesical space.

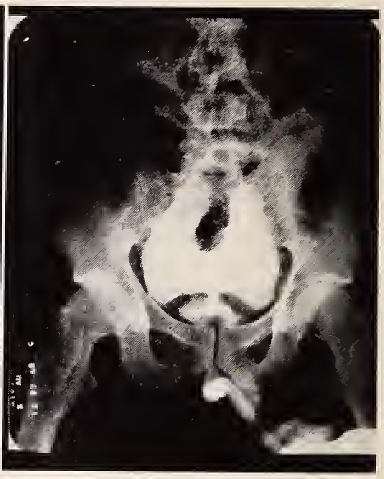

Fig. 3. Cysto-urethrogram in patient with an intraperitoneal bladder rupture.

marked separation of the symphysis and a fracture of the inferior ramus on the right. An attempt was made to pass a catheter per urethra, but this was unsuccessful and when the attempt was made to pass the catheter the patient suffered a marked drop in blood pressure. Therefore, no further attempts were made to pass any instrument through the urethra. The cysto-urethrogram was made by injecting contrast medium through the urethra using an asepto syringe. As one can see none of the contrast medium entered the bladder, but stopped abruptly in the membranous urethra and extravasated into the adjacent tissues. The patient was taken immediately to the operating room and because of his poor general physical condition a suprapubic cystostomy was made under local anesthesia. The patient had an essentially uneventful postoperative course and on the seventh postoperative day under local anesthesia it was possible to pass an F16 5 c.c. Foley bag catheter through the urethra. This was left in place for a week and then a larger catheter was passed, until finally by the third postoperative week it was possible to pass an F24 5 c.c. Foley bag catheter. The suprapubic tube was removed in the fifth postoperative week and soon after that the urethral catheter was removed. The incision healed per primam and the patient voided without difficulty and had no residual urine. He has since been followed and is getting along well. He has developed no postoperative stricture.

Figure 2 is a cystogram showing extravasation of the contrast medium into the left perivesical space.

The case is that of a 39-year-old white woman who was hit by a car while crossing the street. When she was admitted to the hospital she was in shock and had marked abdominal tenderness and rigidity, which was more marked in the left lower quadrant. The patient was unable to void and the catheterized urine was grossly bloody. As soon as the shock had been adequately treated, a suprapubic cystostomy was carried out. The rent in the bladder was sutured and the bone fragments were easily identified and removed. This patient had an uneventful postoperative convalescence.

Unfortunately, in this series of cases, there were no satisfactory radiographs in the two cases of intraperitoneal rupture. However, I have included in Figure 3 a cysto-urethrogram made in a patient who had an intraperitoneal bladder rupture.

This patient was also hit by a car and had fractures of both lower extremities with compounding on the right. After these fractures had been treated it was noted the patient had not voided and he was catheterized and 10 or 15 c.c. of bloody urine were obtained. Following this a cysto-urethrogram was made which showed a small contracted bladder with extravasation of the contrast medium into the peritoneal cavity. In Figure 3, by looking carefully, one can see the dye up in the flank between loops of bowel. This patient had immediate operation with closure of the defect in the bladder and insertion of a suprapubic tube. He eventually recovered.

TABLE V. MORTALITY

	Total	Deceased
Fractured pelvis	125	17 (13.6%)
Bladder and urethral injuries	10	2 (20 %)

The mortality figures in this series are shown in Table V. There was a total of 125 cases of fractured pelvis with seventeen deaths, or a percentage of 13.6 per cent. Autopsies were obtained in sixteen of these seventeen patients and in no instance was a diagnosis of injury to the lower urinary tract missed. Six of these seventeen deaths occurred within one hour after admission to the Accident Room. In the ten cases of bladder and urethral injuries there were two deaths for a mortality of 20 per cent. As stated earlier, one of these deaths occurred in a patient with a bladder rupture who died within three hours after admission to the hospital and whose general physical condition was so poor that no operation could be attempted. The other death occurred as previously mentioned in a patient with a ruptured urethra and at autopsy it appeared that the cause of death was due to the crushed syndrome. The other eight patients with bladder and urethral injuries recovered.

Summary

There were 125 cases of pelvic fracture admitted to the Ancker Hospital in Saint Paul, Minnesota, between January, 1945 and January, 1950. Of these 125 cases, ten were cases of bladder and urethral injury. Of these ten cases there were two deaths with a mortality of 20 per cent. The overall mortality in this series was 13.6 per cent.

It cannot be emphasized too often that all patients with pelvic fracture should be suspected of having urinary tract injury until proven otherwise. All possible attempts should be made to arrive at an early and accurate diagnosis. Once a diagnosis has been made of urinary tract injury in these cases, then the proper immediate steps should be taken to handle the situation. I feel that with injuries to the urethra, if a catheter can be passed through the urethra into the bladder, which will act as a splint and function properly, then that is all that is necessary. However, if it is impossible to pass a catheter, then suprapubic cystostomy should be done. All patients with bladder rupture should have surgical intervention, as soon as the patient's general condition warrants.

Acknowledgment

Thanks are hereby expressed to Dr. Abbott Skinner of Saint Paul, whose help in preparing this paper was invaluable.

APPENDICITIS

(Continued from Page 138)

this means unnecessary surgery. Surely, you do not want pathologists to justify the removal of normal tissue. There is too much unnecessary surgery all over the country."[4]

Summary

Are pathologic criteria of appendiceal involvement correct? In severe suppuration, all are agreed on criteria.

The appendix may be responsible for a chronic syndrome with repeated attacks of cramping abdominal pain which recurs over a period of many years and is permanently cured by appendectomy.

The pathologic diagnosis signifies inflammatory changes found at the time of operation. No evidence may be found, using pathologists' criteria of today, for severe or even perforated appendicitis preceding the operation by several months.

Pathologic diagnosis is not an exact science; it is the interpretation of gross and microscopic findings by a trained mind. *Facts do not vary; interpretations surely do.*

Using pathologic criteria of today, acute appendicitis may be reported occasionally without clinical signs or symptoms of appendicitis.

Time is the best diagnostician. If a tumor declared pathologically benign, kills the patient by invasion or metastasis, the pathologic criteria are suspected. If the removal of a "normal" appendix cures the patient over a period of many years' observation, should one suspect that pathologic criteria may not be complete?

ARRHENOBLASTOMA

Report of a Case with a Normal Pregnancy during Remission and Two Subsequent Normal Pregnancies after Surgical Removal

PHILIP F. ECKMAN, M.D.
Duluth, Minnesota

BECAUSE of its rarity, its unusual clinical manifestations and the speculation concerning its origin, the study of the interesting ovarian tumor, arrhenoblastoma, has proved both fascinating and stimulating. The arrhenoblastoma belongs to that small group recognized as functioning ovarian neoplasms. This discussion will review briefly some points of interest culled from the available literature concerning these tumors, and a case, illustrative of many of the unusual clinical features characteristic of this neoplasm, will be presented.

The paucity of cases of arrhenoblastoma is attested by the relatively small group appearing in the literature. Novak,[9] in a review of the subject in 1938, added six new cases to the previously reported total of forty-five. When the diagnosis was made and operation performed on the patient herewith reported, only about sixty-five cases had been collected in the literature. Subsequently, in 1947, Novak[8] reported that twenty-five additional cases had appeared, and his most recent available estimate[13] places the total number at about 125 cases.

Dockerty,[3] in a survey of ovarian tumors, has brought out some statistical generalities dealing with the relative incidence of various ovarian tumors and has summarized much of this in a prominent wall display, which may be seen on the operating room floor of St. Mary's Hospital at Rochester, Minnesota. In this he points out that, whereas 80 per cent of ovarian tumors are cystic and for the most part benign, the remaining 20 per cent are solid and predominantly malignant. Furthermore, of the solid tumors of the ovary, 15 per cent constitute a special group of four which are classified as "functioning neoplasms." In this group of functioning neoplasms, granulosa cell tumors constitute 10 per cent, theca cell tumors 2 per cent, dysgerminomata 2 per cent and arrhenoblastomata 1 per cent.

From a search of the cross indices of the Duluth hospitals and their associated pathology laboratories since 1925, it would appear that only one other case of arrhenoblastoma, besides the one reported herein, has been diagnosed. This was studied and reported by Daughtry[2] in 1943.

The term "arrhenoblastoma" was originally used by Meyer[7] to designate a group of ovarian tumors which were thought to originate from certain "male directed" cells persisting as embryonic rests in the rete ovarii. Popoff[11] in 1930 and McLester[6] in 1936, on the other hand, contended that such tumors were primarily teratomata with an overgrowth of testicular elements. Kanter and Klawans[5] supported by a case study the teratomatous theory. Novak[8] has pointed out Meyer's valuable contribution in stressing his observation that the functional or clinical manifestations of these various related tumors are determined largely by the degree of their differentiation. Meyer illustrated these gradations by histologic studies contrasting the cord-like arrangement of the undifferentiated types with the tubule-like formations seen in the highly differentiated types, which could well be designated as testicular adenomata. Between these extremes, he described an intermediate type with only imperfect tubule formations, not bearing much resemblance to testicular structures.

The characteristic clinical manifestations of arrhenoblastoma are masculinizing effects which occur in varying degrees, depending upon the degree of differentiation or the type, according to the concepts of Meyer and Novak. The writer's case report presents a clinical picture fairly illustrative of the average course of symptoms. The incidence of malignancy in arrhenoblastomata must, of necessity, remain only an estimate because of the small series of cases studied. Novak has concluded, on the basis of his own experience, plus information gleaned from the literature, that these tumors are associated with a relatively low rate of malignancy. Several fatal terminations in individuals having these tumors have been reported, one by Novak and Long, two by Meyer and one by McCarty and Dockerty (the latter from a recurrence and metastases twelve years following the original removal). Several other recurrences have been reported, and the incidence of malignancy has been estimated to be in the neighborhood of 12 per cent.

The only treatment advisable is surgical removal. Subsequently masculinizing symptoms usually regress, though sometimes not completely, and then femininity returns. Usually the symptoms disappear in the same order in which they developed. Conservative surgery, particularly in young women of child-bearing age, is desirable if possible because of the low degree of malignancy usually found in these tumors. If recurrences are encountered, radical removal of all pelvic organs would seem advisable. Novak[10] considers postoperative radiation in these cases wise but points out that sufficient time has not elapsed in our knowledge of these tumors to properly evaluate its effects.

The occurrence of pregnancy subsequent to removal of arrhenoblastoma has been reported. The sequence of a normal pregnancy following a probable spontaneous remission of the functional activity of the tumor, in the following case report, elicits interest and two subsequent additional pregnancies after removal of the tumor are noteworthy.

Case Report

Mrs. J. Z., a white woman, born in 1921, was in excellent health and had developed normally during her early life. Menstruation, which began at age fifteen, continued with regularity of rhythm at twenty-eight-day intervals and was of three days' duration with somewhat less than the average amount of flow. She had an appendectomy in 1939. In the spring of 1941 she complained of weakness, fatigue and nervous manifestations such as flushes, sweats, palpitation and a sensation of being short winded. An egg-sized adenoma of the right lobe of the thyroid gland was present without evidence of toxicity; basal metabolic rates varying between –2 and –13 were obtained. In June, 1941, menstruation ceased. In November, the thyroid gland was explored and several nodules enucleated from both lobes; these, on microscopic examination, proved to be thyroid adenomata. Following this operation she felt better while taking thyroid extract, but the amenorrhea persisted.

In July, 1942, she married. Thyroid extract therapy was continued. The patient came in occasionally, concerned principally with the amenorrhea. Examination in April, 1943, nearly two years after the onset of the amenorrhea, revealed some interesting changes. Her general appearance was still suggestive of a hypothyroid state; she had obviously been gaining weight. Defeminizing changes were quite apparent. The breasts had become exceedingly small and flat in spite of a weight gain of 25 or 30 pounds. The patient herself had noted a change in the pubic hair distribution from that typically feminine to the male distribution up to the umbilicus. Hirsuitism on the face or elsewhere was not noted. On vaginal examination, the uterus was found to be very small and atrophic with no masses in the adnexal region. The clitoris had become markedly hypertrophied and, on questioning, she described an abnormally exaggerated state of libido. Search for a masculinizing type of neoplasm was undertaken but no evidence could be found. Because of some persistent headaches and blurring of vision, skull x-rays, eyeground examination, as well as visual field determinations, were carried out without finding any abnormalities. Both ovaries were normal on palpation.

In July she was seen by a consultant who administered 2,000 rat units of estrin in oil. Interestingly, one week following this she menstruated; this continued regularly at monthly intervals and the patient stated that from this time on she began to feel more normal. During the next four to five months her weight decreased from 160 pounds to her usual weight of 130 pounds, and she noted a definite decrease in libido and some enlargement of the breasts.

In December, 1943, she again failed to menstruate and on examination subsequently she was found to be pregnant. Pregnancy progressed normally to term and she delivered sponstaneously a normal female child weighing 6 pounds 13 ounces. On her return for postpartum examination in six weeks, a firm, globular mass was found in the posterior cul de sac. She was scheduled for laparotomy, with a tentative diagnosis of ovarian cyst or tumor, probably arrhenoblastoma, on the basis of the previous clinical picture.

The tumor which was removed on October 2, 1944, was about the size of a large orange, measuring 12 by 9 by 8 cm. The surface was smooth and fibrous and of a pale, reddish-gray color. On sectioning, most of the tumor appeared necrotic, with approximately one-third of the area consisting of cysts measuring up to 2.5 cm. in diameter. The cysts were filled with serous fluid, which in some was clear and in others sanguinous. The tissue between the cysts, where it was not necrotic, was soft and edematous in consistency and varied in color from areas which were grayish-red and grayish-white to areas red and brown, indicative of various stages of hemorrhage.

On microscopy numerous sections of non-necrotic tumor tissue were studied. These showed the tumor cells arranged in nests or cords, often anastamosing, embedded in moderately cellular connective tissue stroma. Careful studies of sections from several non-necrotic areas revealed formations similar to those described by Dr. Meyer as the intermediate type (Figs. 1-4). The tumor cells, which were somewhat elongated and somewhat irregular in shape, contained round or oval nuclei, moderately rich in chromatin. There were no histologic signs of abnormal growth tendencies. Cholesterin (fat) was demonstrated by fat stains to be fairly abundant in the tumor tissue.

Dr. George Berdez, St. Mary's Hospital pathologist, diagnosed the tumor as arrhenoblastoma of the ovary. This diagnosis was corroborated by Dr. Robert Meyer

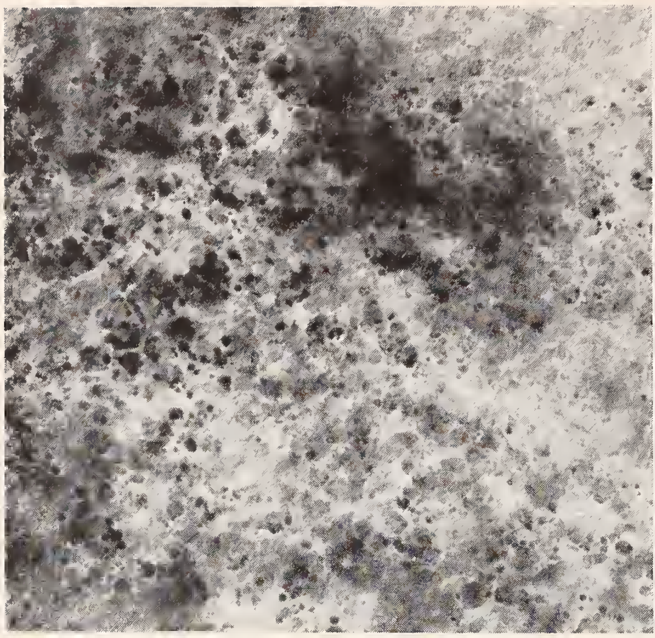

Fig. 1. Differential fat stain (black) with characteristic lipoid content of interstitial cells (low power).

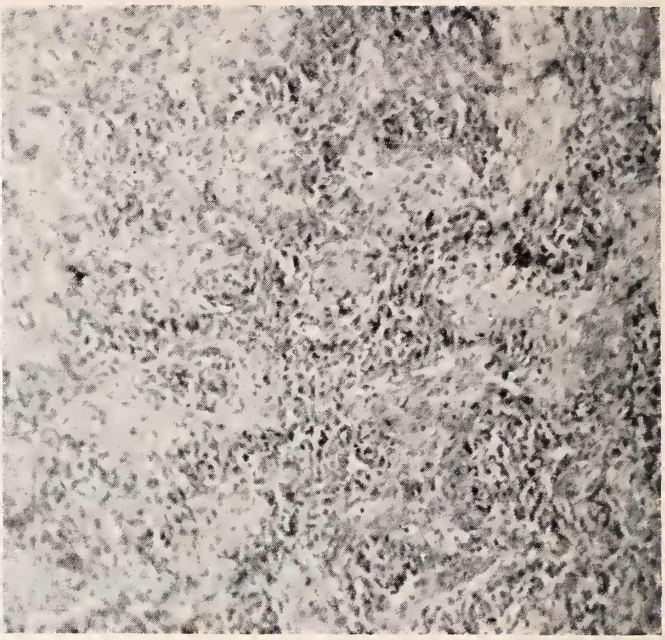

Fig. 2. Arrhenoblastoma of intermediate variety demonstrating tendency to cord formation (low power).

of Minneapolis, who subsequently examined some of the slides. He classified the tumor as a sarcomatous type with some epithelial structures and marked regressive changes. He stated, in a personal communication, that in his opinion the regressive changes had taken place in this tumor before menstruation was re-established and pregnancy occurred.

Since operation this patient has remained in the best of health and periodic examinations have revealed no recurrence in the pelvis or elsewhere. In 1946 she again became pregnant and delivered a normal female infant in December of that year. Interestingly, this youngster came under the observation of a pediatrician because of a large tumor developing in the right side of the abdomen. At exploration, it proved to be a large congenital cystic kidney. At the present time the patient is again pregnant, the estimated date of confinement being January 15, 1951. This pregnancy also is progressing normally, and all physical and clinical manifestations of the arrhenoblastoma, as described above, are now absent.

Summary

Another case of arrhenoblastoma has been presented which was of particular interest because the

MEDICINE AND ITS PRACTITIONERS IN OLMSTED COUNTY PRIOR TO 1900

NORA H. GUTHREY
Rochester, Minnesota

(Continued from the January issue)

Olmsted County received Dr. Mayo as a resident in the spring of 1863, when he became examining surgeon for the newly established Enrollment Board of the First Minnesota District, with headquarters at Rochester. Liking the little city, he bought land where the present Mayo Clinic stands and on the corner of Franklin and Fourth Streets built a home, in which his wife and children joined him in January, 1864. In this house on July 19, 1865, Charles Horace Mayo was born. About 1870 the family home was established on a farm that adjoined southeastern Rochester.

When his service on the Enrollment Board ended in March, 1865, Dr. Mayo bought a site on Third Street, built office quarters, and thereafter devoted himself to general practice, with increasing stress on surgery, and to matters of public welfare, tilting always in behalf of the less fortunate of the population. He was one of the founders of the Rochester Public Library in 1865. He joined in sponsoring courses of lectures by eminent speakers, and on occasion he himself gave lectures on anatomy and on the natural sciences. (In 1871 he was elected an honorary member of the Acadamy of Natural Sciences, of St. Paul.) In the early sixties he began to work for adequate public schools; he served as a member of the city board of education in 1867-1870 and in 1883-1889. In 1870-1871, when Hamline University, then at Red Wing, was looking for a new location and proposed to come to Rochester, he tried to gain acceptance of the university's terms, but the others on the negotiating committee feared increase of taxes and he was voted down. A Rochester citizen who knew the Old Doctor has said, "There were many things Dr. Mayo did for the city and many more that he wanted to do, but he did not have the backing of some of the old fossils among the city fathers." The published list of his suggestions, given at a council meeting in 1886, for civic improvement and for utilization of local natural resources, is catholic. Ultimately there came, not all of them in his lifetime, many of the advances for which he long had worked: good schools, pure water, adequate sewerage, electric lights, a municipal telephone system, a new city hall, paved streets, parks, a lake, expanding highway and railroad facilities, and fair dealing for farmers in the marketing of their produce.

Dr. Mayo performed various civic functions. In the autumn of 1869 he was elected county coroner, although he could not have served the full term because during that winter he was taking postgraduate work in New York City. He was instrumental in organizing, in 1881, the Rochester Board of Trade; was mayor of Rochester, 1882-1883; alderman from his ward, 1885-1889. A fiery politician, originally a member of the Republican Party, in 1870 he joined with the Democrats and the disaffected Republicans to support a platform of anti-monopoly and free trade. In 1890 came his election as state senator on the coalition Farmers Alliance-Democratic ticket. After 1894 he was not in office, but continued in advisory capacity at regional party conferences and often was a member of committees and a delegate to conventions.

His campaign for public health and sanitation began in 1865 when he became a member of the city board of health. Thereafter for several decades he was intermittently on the board as chairman or as secretary and, member or not, was in the confidence of the state board of health and a constructive influence in his community. His periodical reports and his numerous additional bulletins, as published in Rochester newspapers, were classics. One message, in his most forceful style, headed "Poisonous Sweets. The Alarming Revelations of Chemical Examinations of Sugar, Syrup and Candies. To the Public: Death in the Pot," set forth vividly the dangers from adulteration of sweets with chloride of tin. He and Dr. W. N. Vilas had carried out the laboratory tests.

From the beginning of his professional life Dr. Mayo was an advocate of organized medicine. In 1853 he was elected to membership in the Indiana State Medical Society. In Rochester, on April 15, 1868, he was one of the six founders of the Olmsted County Medical Society, and on December 4, 1885, one of the prime movers in reorganizing the society, and its first president. Of the Minnesota State Medical Society he was an active member from February 1, 1869, third vice president in 1871 and president in 1872-1873; he often was a member of committees and a delegate to conventions of the American Medical Association. He became a member of the Ramsey County Medical Society in 1873 when, in partnership with Dr. Charles Hill, of Pine Island, who then was serving as state senator, he practiced medicine in St. Paul during his single departure (May, 1873, to March, 1874) from residence in Rochester. On November 12, 1883, he received state certificate No. 307 (R) under the "Diploma Law" of that year. In 1892 he was a founder of the Southern Minnesota Medical Association.

His inaugural address as president of the state medical society was primarily on the importance of citizenship in "the medical world," and of active duty in the society; his retiring address, on the relation of physicians to the public and each other. Part of his own responsibility in the medical world he interpreted to be generosity and encouragement to young physicians and to boys interested in entering medicine or allied professions; he was preceptor to several youths besides his sons.

There is brief record of his partnership with physicians in Rochester prior to 1883: with Dr. W. A. Hyde for a few months early in 1864; and with Dr. O. W. Anderson from December, 1867, into the summer of 1869. In 1876 and perhaps earlier he engaged as assistant physician Dr. Septimus (Seth) W. Gould; after Dr. Gould removed to Mazeppa Dr. Mayo and Dr. Elisha W. Cross were in partnership from December, 1876, to June, 1878. Dr. Gould returned to Dr. Mayo in July, 1880, and remained until December, 1881, when he entered practice in Pleasant Grove.

Varied and intense as his interests were, William Worrall Mayo was primarily a physician and surgeon, advanced for his time. His much used library contained not only the best in literature but the soundest medical periodicals of the day and the works of masters past and contemporary in all branches of medicine and the natural sciences. Whenever possible he observed the work of eastern surgeons and studied at Bellevue Hospital and at the College of Physicians and Surgeons of New York, and elsewhere, and each year he extended his surgical work. It was ten years, however, from the time he first considered ovariotomy, which ultimately was to increase his prestige, before he first performed the operation, on

December 14, 1880. In the next ten years he carried out thirty-six similar procedures, with low mortality rate. In these operations a varying group of local physicians assisted him; in 1883 Dr. W. J. Mayo began to help his father officially and in 1884 the local press reported that undergraduate "Charley" Mayo was present. The Mayo sons, however, had been their father's companions and assistants since childhood, in office, at bedside, at operating table and even occasionally at postmortem table.

On October 1, 1889, St. Mary's Hospital, in Rochester, was opened officially with Dr. Mayo and his two sons as physicians in charge. The story of the hospital appeared earlier in this paper. From time to time there has recurred a suggestion that Dr. W. W. Mayo's relation to the hospital was a source of dissatisfaction to individual physicians and to some religious groups. In reply to a recent inquiry on this point a resident of Rochester, a Catholic and the son of a pioneer settler, has said, "He was the right man and everyone knew it and was satisfied." The Sisters of St. Frances chose him, they said, because of his professional ability, dignity and integrity, and his impartial generosity to the sick poor.

Stories could be told to illustrate what manner of man this pioneer physician was. Although personal opinions may vary, the consensus is, "We had utter confidence in Dr. Mayo." To answer calls from the sick he considered a sacred obligation and, like his fellow practitioners, to do so promptly he kept a good stable. He drove at top speed and, being a small man (standing five feet four inches and weighing 120 pounds), he strapped himself to the seat of his vehicle for safety when the going was rough, as it usually was. In the autumn of 1881 a local carriage maker built to Dr. Mayo's design an enclosed English gig, and a harness maker constructed a special harness to suit the unusual plan of thills and whippletree. The gig was "a peculiar looking affair but light running, easy and convenient." Known as Dr. Mayo was for speed on the highway, the local people always pulled out to give him the road, and the new outfit made identification even easier.

With all his ability William W. Mayo was not a businessman. He was too generous for his own financial good, and collecting fees and keeping accounts were foreign to his nature. Members of his family, when he was away, were more successful in this department. The earliest case and account books that survive are those of 1876-1877, when the doctor was in partnership with Dr. Cross, and a few from 1880 into 1884. The charges were low, fifty cents for office consultations, a dollar or a dollar and a half for outcalls. The notes on patients were brief and not clinical: "John Mahoney, son of Jerry, on Tolbert place, south"; "Maurice O'Connor's son, Stewartville, married Pat Rahilly's daughter"; "Man on one of Pencill's farms." In September, 1883, "Scratch off charges against ———, ———, and ———, made during cyclone."

Louise Wright Mayo, the balance wheel of the family, as her elder son described her, was an able assistant to her husband in his practice. About her a well-known surgeon of the Pacific Coast who from boyhood was a close friend of Will and Charlie Mayo and often in their home, has said: "She had a keen mind, a practical knowledge of medicine, and was one of those wonderful people who grow old gracefully and keep an active interest in things that are worth while." She was an excellent amateur botanist and astronomer. Her sound knowledge of common diseases and of treatment for them and of fractures and dislocations she gained from experience and observation, from her husband and from study of his medical texts and journals. It has been said that she had almost as many patients as the doctor, and Dr. Mayo is quoted as saying, "If I am not here, call my wife; she can do as much for you as I can." It was Mrs. Mayo, in 1870, who encouraged her husband to mortgage the family home to purchase a fine microscope to further his care of the sick. Years later she was the proud and loving observer of her sons' progress and at the same time their severest critic if their medical papers were not up to her mark or if their general conduct did not entirely please her. She and her husband agreed in their broad charity and in their sense of social obligation. Her precept, "Life is not a question of what others owe to us, but of what we owe to others," had as formative effect on her children as did the doctor's teaching that no man is big enough to be independent of his fellows.

In retrospect the full worth of William Worrall Mayo is perhaps more apparent than it was in his lifetime. He was a man of excellent education for his time and place, he had faith in his own judgment and the courage of his convictions, yet he never was satisfied with himself, with the knowledge he had or with the things he did. He had foibles, was dogmatic and on occasion belligerent, and he made enemies, but his enemies respected him. He did not allow personal feeling to conflict with professional faith. He once said, when questioned about religion, "My own religion has been to do all the good I could to my fellow men and as little harm as possible." A facile public speaker, his favorite subjects, outside the realm of science, were social justice and the power of liberal ideas. In his old age, when addressing an audience who expected sentimental reminiscences, he gave them stirring prophecies of social and scientific advance: Tomorrow was the great day.

From youth to age his eyes were turned to new horizons, intellectual and geographic. Always an eager traveler, with the coming of relative leisure and financial ease he visited many parts of the world. At the age of eighty-five years he went alone on a long tour; on his eighty-fifth birthday Rochester honored him at a banquet which was attended by local residents and by prominent citizens from various parts of the state, and presented him with a silver loving cup inscribed, "William W. Mayo, from his Rochester Friends: May 31st, 1904." His eighty-eighth birthday he celebrated on shipboard while en route to China and Japan.

Nominally retired from practice in 1900, he continued to use his desk at the offices, to see patients and to make regular rounds at St. Mary's Hospital. In the autumn of 1908, at eighty-nine still interested in chemical research, Dr. Mayo while attempting to correct mechanical equipment that he was using in an experiment, received a severe injury to his left hand and forearm that caused a long terminal decline. When he died at his home on March 6, 1911, in his ninety-second year, he was survived by his wife (who died on July 15, 1915), one daughter, Gertrude Emily (Mrs. David M.) Berkman (whose death occurred on July 22, 1938), and two sons, Dr. William J. Mayo and Dr. Charles H. Mayo.

Not long after his death there was erected to the memory of William Worrall Mayo, in Mayo Park, his life-sized statue in bronze. Funds for the purpose had come from thousands of voluntary subscribers; no single contribution of more than one dollar was accepted. On the pedestal are engraved his full name, the dates of birth and death, and the words suggested by his sons: "Pioneer, Physician, Citizen, a Man of Hope and Forward Looking Mind."

His was a useful life. He helped the sick, the needy and the oppressed, influenced ideas, ideals and usages in the profession he loved, and gave rare opportunity to his sons.

"My brother and I."—It is impossible to write about either of the brothers, William J. Mayo and Charles H. Mayo, without including the other, and that is the way they would have it. They possessed, differently, the best traits of their unusual parents, and they were blessed with originality and the divine spark of discontent that leads to progress. They said of themselves, looking back over a lifetime, "We were always together." With years there inevitably had come con-

flicting personal interests and sympathies which between most men would have caused a rift but which between these two only strengthened the bond.

A story comes from an old friend of William J. Mayo and Charles H. Mayo from earliest days. When they were children, there lived in their neighborhood a youthful bully who tyrannized over all boys smaller than himself, and among the smallest were the Mayo boys. "The situation was a miserable one for all the kids in the locality." The Mayo brothers talked it over earnestly, debating together whether it would be right for the two of them, so much smaller, to tackle the big boy. They decided that teamwork was ethical; there was no more bullying. Sixty-five years later the teamwork was still in effect.

The evolution of their names is interesting. At the age of eight years Willie Mayo broke his arm while riding his pony. Charlie had his childish adventures. Willie Mayo and in turn Charlie Mayo went away to medical school; they returned Will and Charles; then were Dr. W. J. Mayo and Dr. C. H. Mayo. They soon became in Rochester, and presently to thousands elsewhere, and so remained, Dr. Will and Dr. Charlie.

Unlike in appearance and manner, sometimes differing slightly in concept, the brothers were one in spirit and action. They supplemented and complemented each other. The elder, of medium height and almost military bearing, fair coloring, and alert and intent gray-blue eyes, possessed imaginative vision and executive ability as rare as his surgical genius, and with it all a gift for deep and loyal friendship. The younger, short and stocky, of casual posture, dark hair and complexion and brown eyes of changing expression, possessed rare surgical ingenuity and versatility and a delightful spontaneity in human relationships. Dr. Will had a kindly sense of humor, a keen appreciation of the comic; Dr. Charlie, equally kindly, an incorrigible sense of drollery that was always with him. They both had, Dr. Harvey Cushing said, something of the Lincolnesque about them, in their modesty and self-effacement, in their shrewd appraisal of other people in whatever walk of life, and in a quiet dry wit, always ready, with which they saved many an awkward situation by telling an appropriate story more often than not turned on themselves.

In almost the same words each explained their success: "We were two men who loved each other and had absolute confidence in each other, who lived out of the same purse, who were anxious to do what they could, who came into activity at just the right time in the development of medicine and surgery." And, "We have the same ideals and these ideals are dear to us and mean more than reputation or reward."

They were never conscious of making a choice of profession; from first thought they expected to be doctors. They grew up in the atmosphere of books guided by a wise and tolerant mother and trained by an intelligent father who was a well-trained and successful physician and surgeon. Dr. Mayo taught them chemistry and anatomy, directed their reading, and instilled in them from their early childhood the theory and practice of ethical medicine, illumined by his own wisdom and experience. From the schools of Rochester they went to medical colleges, chosen by their father, that offered most in length and scope of training.

During their formal education in medicine and surgery they were taught the new methods of asepsis and antisepsis, which they adopted from the beginning of their practice. They always said that they had had an unequalled opportunity to apply new scientific methods of treatment in a new hospital (St. Mary's) operated on a new basic principle. As their practice grew, they added to their staff physicians, surgeons and research workers, the best men they could get. Thus the development of co-operative medicine was begun by them, and it grew, and the physicians who visited them began to call the group the Mayo Clinic. As time went on, through internships and the taking on of men who wished to act as assistants for the purpose of learning, the teaching function established itself and finally developed into the Mayo Foundation for Medical Education and Research, affiliated with the University of Minnesota.

Of keen intelligence, the brothers were constant, not brilliant, students, dedicated to a purpose greater than themselves. Alternating in absence from Rochester, they traveled extensively in the United States and abroad, visiting clinics, hospitals and universities where surgical work new to them was being done, observing and learning, never criticizing, and always bringing home and applying new knowledge. They were faithful in advancing organized medicine and in contributing, together and separately, to medical journals; each ultimately had a bibliography of several hundreds of papers on varied subjects, technical and philosophical.

Dr. W. J. Mayo and Dr. C. H. Mayo were master surgeons, in earlier years in the same fields and later, mutually consenting, in different special fields. Each had courage and rare surgical judgment. Although each originated many operative procedures, some of which bear their name, they made no claim of priority: "The acceptance of observations on original contributions to surgery necessarily must be qualified, for the reason that a surgical method may be original with more than one person and in different periods of time" (WJM). With characteristic modesty each bowed to the other as leader in achievement. In the period of their greatest professional activity they were known as "the surgeons' surgeons," and they took satisfaction in having each been surgeon to more than thirty members of the American Surgical Association and to immediate members of those surgeons' families, and to many other members of the medical profession.

They were sought as speakers at medical meetings, commencement ceremonies, and civic functions. Each was proposed, unofficially, more than once for the governorship of Minnesota and for the presidency of the United States; even if such proposal could have been accepted jointly, they would have refused, in devotion to their profession. Their military careers were parallel, from lieutenancy in the Medical Reserve Corps of the Army of the United States to brigadier-generalship in the Inactive Section, Officers Reserve Corps. Each received the Distinguished Service Medal for his work as alternating chief consultant in the office of the Surgeon General during World War I. Their honors, citations and awards, their memberships in medical societies and in organizations devoted to other sciences and to the arts and to human welfare comprise impressive lists. In the board of governors' room of the Mayo Clinic hang their certificates, medals and diplomas; in an adjoining narrow corridor are their military uniforms and their academic costumes from universities throughout the world. In June and July, 1946, these academic gowns, hoods and hats were on view outside the clinic for the first time, in the gallery of the University of Minnesota.

With their hearts in their home city, which as they progressed grew and prospered because of their generosity and civic pride and loyalty, they were citizens of the world, and they became news. At long last they consented to the publication, by the University of Minnesota, of a book* about their father, themselves and the work that had become the Mayo Clinic and the Mayo Foundation, stipulating that other than making records available they should have no part in its preparation. In 1937 Dr. W. J. Mayo in one particular changed his decision: he wrote to Mr. T. E. Steward, of the University, who then was compiling material toward the history, "I want to tell you something about Charlie," and went on to describe Dr. C. H. Mayo's originality, scientific imagination, surgical genius and personal loyalty: "He has never desired to develop what would rebound especially to his own credit. He has the least self-glorification of any man I know who has accomplished great things." At that time Dr. Charlie was very ill; when later he saw this plain statement of fact, as his brother called it, he said, "Isn't Will going to tell about himself? If he doesn't, I will." Unfortunately, such statement never was written.

**The Doctors Mayo*, by Helen B. Clapsattle, of the University of Minnesota, was published in 1941, more than two years after the death of Dr. C. H. Mayo and Dr. W. J. Mayo.

In their last ten years together there was an unfailing routine when they both were in town. Dr. Charlie would come in eagerly every day, "Is Will here?" Dr. Will entering the corridor would call out, "Have you seen Charlie today?" and immediately go in search of him. One day, in their last year, when they were about to leave town on different occasions they met in the older brother's office, and stood for a moment, each with his hands on the other's shoulders. "Well, Charlie." "Well, Will." And, almost together, 'We've had a good time." Whenever they parted even for a few days, in that year, they felt that it might be a last good-bye.

When Dr. Charlie died and when Dr. Will soon followed, the world paid them tribute. With their passing an epoch ended. Together they had added much to the sum total of human knowledge and had contributed greatly to the improvement of human welfare.

The following notes about them individually are but annotations on the record

William James Mayo (1861-1939), the fifth child and elder son of Dr. and Mrs. William Worrall Mayo, was born at Le Sueur, Minnesota, on June 29, 1861, and came to Rochester with his parents when he was three and a half years old.

After finishing the grades and high school, William J. Mayo studied languages at the school of Miss Finch and next had instruction at the Rochester English and Classical School (Niles Academy); in vacations he worked as assistant in a drug store. In September, 1880, he entered the medical department of the University of Michigan, at Ann Arbor, because that university, one of the first in the country to do so, recently had increased its medical course to three years. At Ann Arbor he came into close association with men of personal and professional merit: Donald Maclean, Professor of Surgery, who was in effect his preceptor; Corydon L. Ford, with whose approval he served as "volunteer instructor in the upper dissecting room"; George E. Frothingham, Alonzo B. Palmer, Victor C. Vaughan, and many others; and he made friends whose purpose in life was as earnest as his own. He was one of the six founders of Nu Sigma Nu fraternity, a group of idealistic students, "an aristocracy only of brains in which intelligent medical curiosity was the mainspring." His one departure from study was boxing; he weighed 130 pounds, boxed in the 133-pound class and was college champion.

Graduated from medical school on June 28, 1883, at the age of twenty-two years, he returned home to enter practice with his father. On November 13, 1883, he received his Minnesota state license No. 308 (R) under the "Diploma Law" of that year. His first few years in practice were a struggle for recognition on his own merit rather than as his father's son. Those were the "foot-in-the-door" days. In meeting hazards of accident, weather and even wolves in his far country calls he was as much a pioneer as his father had been. An excellent horseman from boyhood, he liked fast horses and for some years did his own driving; it is difficult for those who knew Dr. Mayo only as an older man who rode in chauffeur-driven cars to picture him in that early role.

(To be continued in the March issue)

President's Letter

"HOW BAD ARE WE?"

During 1950, and especially during the latter half of the year, American Medicine seemed to be in a bad way if one could believe the pseudo-information which burdened the mails out of Washington. One read that physicians were inefficient; were unwilling to work unless paid exorbitant fees; there were too few of them; they would not practice in small towns; the nation's health was deteriorating; things were bad. One read in the *National Health Insurance Handbook,* put out by the Committee for the Nation's Health and published in Washington, that many workers lost time through illness. The repeatedly disproved story of the draftees rejected during the last war because of "remediable or preventable" illness or physical defects was repeated. One could read on and discover that too many mothers needlessly die in childbirth. It was stated also that 25,000,000 lives are blighted by disability or physical impairment, presumably by lack of medical care. Sources of these figures not given.

The profession is anxious to learn more about these chronically ill and old age groups. The Minnesota State Medical Association has appointed a new committee, the Committee on Chronic Illness, to make a study of and to make suggestions for this group disabled by chronic illness. This committee will study the number of such disabled persons and make a further investigation as to possible remedies.

The physicians of the country would be interested to learn how compulsory National Medical Care would prevent congenital physical defects or abolish congenital mental deficiency. Refusal of patient to accept medical care, either preventive or curative, could hardly be remedied under a national system.

New Health Record

How refreshing, then, to read in *The Journal of the American Medical Association* of November 25, 1950, of the outstanding record in maternal care during 1949 in these United States and of a new low of less than one maternal death per thousand live births.

The Journal of the American Medical Association makes the further statement:

"This glorious achievement of medical progress has not been limited to the wealthier states with almost exclusively white populations. In 1949 there were thirty states with rates of less than 1.0; two at exactly that level, and only seventeen above. The highest state rate was 2.3 in 1947, and this was only one-half of the lowest state rate, 4.3 in 1933."

Plan Further Study

A brochure prepared by the Division of Maternal and Child Health of the Minnesota Department of Health for 1949 is another answer to those critics who see widespread neglect of maternal care. It should be mentioned here that over 96 per cent of the maternity cases in Minnesota were hospitalized in general hospitals and most of them were cared for by well-trained general practitioners. The Council of the Minnesota State Medical Association has approved a study by its Maternal Health Committee for the year 1950, in an effort to reduce maternal mortality still further. Minnesota has always had an excellent record for maternal care.

Let us add that this improvement in the quantity and quality of medical care was not confirmed to maternal and child health. Throughout the nation the improvement in health has been remarkable. Longer life expectancy is noted. There was less chronic illness among patients formerly considered bed patients, and illness due to nutritional disorders was lessened. On the national level one should review the Statistical Bulletin of the Metropolitan Life Insurance Company "Health and Longevity at the Mid-Century," January, 1950. They report that during the half century, American wage earners and their families as represented in insurance experience, have shown a greater gain in expectation of life than has the population as a whole. This added expectancy has been made possible by better medical and nursing care.

Benefits for Both

Progress will continue to improve the health and longevity in the future. The new discoveries are made available to the physicians of every city and village. The physician of the next fifty years will be eager to benefit by such new agents and will see that they reach his patients.

It would seem that the American medical profession has not been indifferent to health needs of the country, both preventive and curative. The profession is alert to the needs of the people under new standards of living and under the added stress of war. It will do its part in this new national emergency both at home and in the armed forces.

BANTHINE

ACCORDING to our present conception, the cause of peptic ulcer is in some way related to a reflex nervous mechanism, and healing of the ulcer is prevented by the accompanying hyperacidity. The neutralization of stomach acid in the treatment of peptic ulcer by alkalis and food, which has been the purpose of medical treatment since Sippy first brought forward his famous diet, is attacking the problem from only one angle. A method for lessening the secretion of hydrochloric acid in the stomach (without resorting to the expedience of surgically removing most of the stomach itself or its vagus control), which would lessen the peristalsis of the stomach at the same time, should prove ideal.

It may be that the drug known as Banthine may turn out to be the long-sought drug. Dr. Raymond N. Bieter of the Department of Pharmacology at the University of Minnesota is one of those who are investigating the drug's value, and he claims that the observation of a large number of patients over a period of two years will be necessary before definite conclusions can be drawn. Possibly a longer period will be required for final estimation of the drug's value. In the meantime, thousands of sufferers from peptic ulcer will have tried Banthine on the prescription of their medical advisors, and doubtless the lay press will draw conclusions before members of the profession have made up their minds.

According to Bieter a 100 mg. tablet of Banthine will reduce the quantity and degree of acidity of the gastric juice markedly and will also definitely delay the emptying of the stomach and the progress of a meal through the intestines. His recommended dosage of 50 mg. every four hours night and day does not slow the progress of food through the gastrointestinal tract sufficiently to cause untoward symptoms. It does produce a dry mouth, minor disturbance of visual accommodation, loss of bladder tonicity and reduction in libido, all of which reactions, however, are temporary and usually of minor importance.

Banthine is being widely used both with and without interval feedings and antacids. The drug affects both the sympathetic and parasympathetic nervous system and has much the effect of vagotomy without being permanent in its action. Strangely, it does not affect the heart and apparently is harmless in the recommended dosage.

THE NEED FOR EARLY DIAGNOSIS IN RHEUMATIC FEVER

RECENT work on the problem of rheumatic fever has caused us to reassess our knowledge. Especially since the advent of Cortisone and ACTH, fundamental studies have been possible which point to an altered membrane permeability which may be a fundamental factor in all our collagen disturbances. The rheumatic state is only one of these, and of course any contribution to our basic understanding of these disturbances is a ray of light on this at present inexplicable problem. These studies are exciting enough to promise fruit in our generation. I think it is safe to say that more steps forward have been made in the past 15 years than have been made in the past several centuries. This has been made possible by improved methods of study, improved tools of investigation, an awakening of public interest in its own problems, and by the provision of research funds which have been made available due to this interest.

Although the golden age has probably not arrived as yet, certain trends could well be reviewed at this time. First, there may well be a definite hereditary factor in rheumatic fever which may be due to biochemical differences between a child susceptible to rheumatic fever and one not so marked for trouble. Work on detecting this biochemical difference is proceeding rapidly and may prove very valuable. However, a careful family history will elicit the practical information necessary. If these susceptible children could be "tagged," they could be given close observation and care.

Second, there is the association with the streptococcus. Sufficient evidence has accumulated to induce the physician to accept this relationship and take what steps are available to cope with the problem. Those children "tagged" as potential rheumatic fever victims or susceptible children should avoid exposure to streptococcal infections so far as possible, but, if they become infected they should be given the best of care by their private physicians. This points to a definite public health service that every practicing physician should accept as his own personal responsibility.

Third, there seems to be a direct beneficial effect of Cortisone and ACTH on the symptomatology of rheumatic fever. I use these words advisedly because, although the fever, arthralgia, acute carditis and laboratory evidences of activity seem to abate rapidly, what effect this remission of symptoms has on the over-all picture of heart disease has yet to be proved. Time and experience alone can answer this problem. However, even the most conservative observer must concede that there appears to be hope on the horizon.

Fourth, there seems to be a direct relationship between early institution of therapy with Cortisone or ACTH and the rapidity with which a remission occurs. If this effect proves on further study to be the predominant response, it makes the early recognition of rheumatic fever imperative. This means that all those closely associated with children must avail themselves of the existing knowledge as to the accurate diagnosis of rheumatic fever. The parents, teachers and school nurses are the ones most closely associated with the children, but the family physician is the key man in the situation. It is he who must evaluate the picture and give advice. He must always keep in mind the cardinal diagnostic points of a child sick with polyarthritis, carditis, rheumatic nodules and chorea. When this syndrome appears in a child with a family background of rheumatic fever or a history of a previous attack of rheumatic fever, he must be doubly alerted. Treatment of this disease in the early exudative stage can do much to lower the incidence of cardiac damage. Such therapy as bed rest, removal from an environment in which the streptococcus is rampant, elimination of the streptococcal infection in the patient and reversal of his hypersensitive state are necessary. The time-honored drugs which help in the latter are the salicylates. Apparently these drugs do more than alleviate pain. Recent animal experiments have shown that various hypersensitive reactions can be controlled by salicylates. ACTH has been called "expensive aspirin," but it seems to be more than that. It calls forth adrenal cortical stimulation which has a multitude of effects on the body. Some of these are remedial as stated above but excessive and prolonged stimulation of the gland as in ACTH administration, or substitution therapy as in Cortisone administration, seems to bring about unfortunate effects. Examples of this are the accumulation of sodium, water, chlorides, and glucose with the loss of potassium, uric acid, nitrogen, calcium, phosphate and vitamin C. A note of warning must be injected at this point. The indiscriminate use of ACTH and Cortisone would not only be dangerous but would add up to a confused mass of data that could never be properly analyzed and would add too many conflicting opinions.

The thought then would be to derive the beneficial effects of adrenal stimulation in the early, exudative stage of rheumatic fever. This necessitates early diagnosis.

The present is a propitious time for the medical profession of Minnesota to go all out on rheumatic fever. We now have a uniquely favorable situation in this area to study and care for such patients with the new Variety Club Heart Hospital and the American Legion Research Professor in Rheumatic Fever and Heart Disease in Children. We have a flourishing Minnesota Heart Association which is providing funds for research through contributions of those far-seeing citizens who are greately interested in doing something to lessen the ravages of heart disease. With this combined force, Minnesota should make many major contributions toward the solution of all aspects of the problem and perhaps lead the nation in this struggle.

Since the future holds so much in store for us through this program, it is up to us as family doctors to contribute our best efforts in its support.

Paul F. Dwan, M.D.

STUDENT AMA

AN ORGANIZATION known as the Student American Medical Association was recently organized by student delegates from forty-eight medical schools throughout the country with a total membership of 15,855.

The Student AMA has for its objective the advancement of medicine, contribution to the welfare and education of medical students, familiarization of its members with the purposes and ideals of the medical profession, and preparation of its members to meet the social, moral and ethical obligations of the profession.

Warren R. Mullen of Jackson, Michigan, a student at the University of Michigan Medical School, was elected president; Harry W. Sandberg of Moline, Illinois, a student at the University of Illinois College of Medicine, was elected vice president, and David Buchanan of Huron, South Dakota, a student at the University of South Dakota School of Medical Sciences, was elected treasurer. Seven other students were elected to the executive council.

The association will be made up of academic societies in medical schools of the United States which are approved by the Council on Medical Education and Hospitals of the AMA. Each society, not more than one at any school, must have a membership of at least one-fourth of the students, or eighty-five students, whichever is the smaller.

An advisory committee to each constituent society will be composed of the dean of the school or his appointed representative, two faculty members elected by the students, a county medical society representative and a state medical society representative.

The student House of Delegates has named its president and vice president as representatives to the AMA House of Delegates. A change in the constitution of the AMA to provide for such representation is expected to become effective at the annual meeting in Atlantic City in June.

RED CROSS

TOO much publicity cannot be given to the need for increasing financial support of the Red Cross for the coming fiscal year.

The goal of the national campaign this year is 85 million. Last year's goal of 67 million was not reached. Only 65 million was raised. Thus a 30 per cent increase in contributions will be needed this year. Reserves which have been called upon in recent years have now been exhausted.

The national Red Cross is a huge organization, with 1,600,000 individuals taking part in its various activities, 14,525 being on the payroll at an average pay of $2,500.

The former national chairman of the Red Cross, George Marshall, having been appointed the new Secretary of Defense, has been replaced by E. Roland Harriman, who is serving without salary.

More than half of the Red Cross funds go to services for the members of the armed forces and veterans. As a result of the military program the need for increased services is apparent. As the Red Cross supplies the blood service for the armed forces, the expansion of this service is expensive. The possibility of bombing requires much more training in first aid and increased storing of supplies in preparation for such a catastrophe. Recent monetary inflation further increases the need for additional funds.

Red Cross furnishes personalized services for those in the armed services—services which the Army and Navy do not supply. This private organization will doubtless receive the increased financial support which its activities so richly deserve.

RABIES INCREASES

Two cases of rabies have recently appeared in dogs in Minnesota, and a number of cases in other animals. Many of the recent cases have been traceable to skunks. Dogs are the most dangerous carriers of this fatal disease, because of their close contact with human beings.

A dog in Hennepin County was bitten by a skunk about October 26 and became ill with symptoms of rabies ten days later. Fortunately, it was securely confined until its death November 9. Positive diagnosis was completed November 29, through the use of mouse inoculation tests performed by the laboratories of the State Live Stock Sanitary Board. In Cottonwood County both a cow and a dog were infected with rabies after being bitten by a skunk. Other cases reported since mid-September have involved domestic animals bitten by skunks. This unusual outbreak of rabies in skunks is explained by the fact that these animals are no longer killed for their fur; hence they are increasing rather rapidly. Rabies infects skunks in other sections of the country and the disease has gradually spread to Minnesota. Animals suspected to have been infected with rabies are examined by the Live Stock Sanitary Board, unless a human being was involved, in which case the examination is made by the State Department of Health laboratories.

No human cases of rabies have been reported in Minnesota since 1917. Persons known to have been in contact with rabid animals have been protected by anti-rabies vaccine in every case in which there was danger of their having been infected.

"An animal suspected of rabies should not be killed," say Health Department physicians. "The animal should be kept very securely confined and observed for fourteen days. If it is still alive and has not developed any symptoms by that time, it was not rabid at the time of biting. If it is necessary to kill the animal, do not shoot it through the head. It is by careful examination of the brain that rabies is diagnosed. Report all animal bites to your physician and local health officer. Full information about the prevention and treatment of rabies may be obtained from local doctors and veterinarians."—*Minnesota's Health,* December, 1950.

MEDICAL ECONOMICS

of the
Minnesota State Medical Association
George Earl, M.D., Chairman

COMMITTEE MEMBERS CONDEMN LOBBY REPORT

Three minority members of the House of Representatives' Select Committee on Lobby Activities, recently issued a joint statement calling the "Interim Report" of this committee on lobbying, an "attempt to smear American enterprise and to discredit our American system."

The "Interim Report" concerned itself primarily with lobby activities of businesses and corporations, and was issued during the November election campaign. Simultaneously with this report, a press release was issued on so-called corporate lobbying, stating that 152 corporations spent over thirty million in the last three years to influence legislation. No mention was made of government lobbying which far exceeded that of business during the same period.

Applaud AMA's Campaign

These members, Halleck of Indiana, Brown of Ohio and O'Hara of Minnesota charged that the committee had been extremely unfair in disapproving the activities of the American Medical Association:

> "The report is extremely critical of the activities of the American Medical Association in its opposition to socialized medicine. At the same time it tacitly approves the activities of those organizations—such as the Committee for the Nation's Health—which favor not only socialized medicine, but socialized housing, socialized education, socialized industry and socialized agriculture.
>
> "A hasty examination of this distorted report . . . indicates that the majority generally approve as in the public interest all lobbying which favors passage of measures in the program of socialization, and disapprove all activities designed to uphold private initiative and government. In terms of this proposed report the defenders of the traditional American Constitutional system apparently can do no right; the left-wing groups seeking to destroy that system can do no wrong."

Cites Ewing's Trip

The statement emphatically condemns the committee's attitude that "all lobbying by business and conservative elements is bad; all lobbying by left-wingers, labor organizations and Fair Deal office holders is good." The "Interim Report" also regarded Ewing's trip to Europe to sell socialized medicine as perfectly legal:

> ". . . the report approves the tax-financed European junket by Oscar Ewing and his staff to advocate socialized medicine on a world stage. Ewing . . . held press conferences in London, Dublin, Edinburgh, Stockholm, Rome and Tel-Aviv.
>
> "Approval also is extended to outright lobbying activities of Ewing, including the luncheon he gave in his office for organizations supporting bills he desired passed—a luncheon served by Federal employees.
>
> "On the other hand, privately financed, dignified, factual, educational campaigns by citizens, professional and business groups, opposed to the socialization of America, are condemned as vicious."

Report Called "Lopsided"

Calling the report as "lopsided as the leaning tower of Pisa, as intolerant as an article in Pravda," the representatives declared that the report approved of non-registration of certain lobby groups, while it disapproved of groups which conformed to all the rules and regulations requiring registration and disclosure of financial sources.

TAXPAYERS GROUP ANNOUNCES TAX REDUCTION WEEK

The week of March 27 through April 1 has been designated in Minnesota as "Tax Reduction Week" by the Minnesota Taxpayers Association. In urging citizens to make the week an effective statewide movement, the association said:

> "This originated in . . . Minnesota and is apparently being taken on by citizen-taxpayer groups and organizations in practically every county. It is felt that this medium of citizen expression for tax reduction, through economy in government, will clearly demonstrate the temper of our people on the tax question.
>
> "The apparent 'sense' of public attitudes today is more and more towards economy in government as an economic necessity."

Americans can understand the necessity of more taxes during a national emergency to pay for defense, but most of them find it difficult to tolerate unnecessarily high levies when government waste and duplication abound in sufficient quantity to provide a substantial tax reduction.

DRUGGIST SEES GREED ARISING

Speaking before the Medical Society of the State of North Carolina, John W. McPherrin, editor of the *American Druggist,* reported that greed was showing its ugly head among users of the British national health service. He said:

> "Among doctors and pharmacists, I found many who were for the scheme—because they were making more money. These are the mediocre doctors and unsuccessful pharmacists. Among all people—patients, doctors and pharmacists—I was amazed to see human greed showing its ugly head."

Mr. McPherrin pointed out that the human element of acquisitiveness is largely responsible for the many evils of the British system. He warned that in America, where there are many who would transfer that same system here, the danger is equally great. In discussing this factor, he said:

> "Perhaps the basic problem is deeply rooted in human nature. It would appear that not every patient, doctor, or druggist is as noble and unselfish as the social planners have presupposed. Since those in charge of a Welfare State assume the authority to control any situation, they might shoot the works and issue a decree outlawing all human selfishness. Of course, it won't achieve the miracle, but the idea is no more unrealistic than some assumptions of political humanitarians.
>
> "Failure to realize that human nature doesn't change overnight has created grave problems for the Britons. Those who planned the Welfare State of Great Britain had no idea that their free health scheme was going to reveal so much human greed and selfishness. This characteristic of the human race is present among all people. It is not something peculiar to the Britons. They are no more selfish than we are. The same kind of a free health scheme in America would bring just as much greed to the surface, and result in just as many costly abuses by patients, doctors, and druggists."

Greed Curbed by Competition

The American system supplies a natural and effective curb on too much human greed, according to Mr. McPherrin. The social significance of the free competitive system found in American private enterprise, is the basic factor which makes it necessary for Americans to please their fellow businessmen, therefore effectively curbing greed by the creation of less selfish business methods to please the customer.

Mr. McPherrin cites an example:

> ". . . if a druggist doesn't have the good sense to conduct himself properly, his competitors will soon get his business. We believe that the same principle applies to doctors and hospitals wherever they exist in adequate numbers.
>
> "Without this free competition for the favor of the public, the only alternative is to pass more laws and create more controls in a vain effort to control human nature. It can't be done. Even in a police state, the people merely appear to be under control."

British Spirit Undermined

After spending some time in Great Britain, Mr. McPherrin concluded that the British Health Service has greatly affected the spirit of the people in England:

> ". . . I came home with new reverence for the faith of mankind that created America. It is my conclusion that there is no hope, peace of mind, or real security for anyone in the belief that 'The State is my Shepherd; I shall not want.' This is the real concept of the Welfare State, and it has done something to the British spirit. Nothing, not even free health service, is more important to a nation than the spirit of its people."

BRITAIN REPORTS INCREASED ILLNESS

That the rise in reported illness in England is a result of more people taking advantage of government medicine, is not the complete answer, according to a recent issue of the *Christian Science Monitor.*

Britain reported that sickness among adults rose 8 per cent and workdays lost through illness rose 22 per cent. The workdays lost by young women climbed 32 per cent and by elderly women 41 per cent, while the workdays lost by men went up 8 to 9 per cent. The paper says:

> "Officials credit the growth of reported illness mainly to economic reasons—people now getting medical service who previously could not afford it.
>
> "But there are additional reasons. In the experience of European countries with compulsory sickness insurance it has long been observed that when workers are taxed for medical care they often claim it unnecessarily. That is the only way that many figure they can get something back for their money. The situation encourages a flood of patients with minor illnesses for which they would not ordinarily seek medical attention. Some doc-

tors are consequently overworked to the point of hasty, careless diagnosis and treatment."

The newspaper also notes that other reasons for the increased reported illness are being soft-pedalled by the Fair Deal advocates:

"It is also a standard part of the government insurance system to give weekly cash payments to claimants. The chance to stay at home and live for a while with the aid of state funds frequently militates against a speedy return to work. In many instances the cash benefits delay recovery.

"The more workdays lost through illness, the smaller the production and the lower the general standard of living.

"These and other disadvantages of a national system of government insurance for medical care are getting no publicity from the Truman administration. British experience, however, is bringing out some of the missing facts."

THE MINNESOTA STATE BOARD OF MEDICAL EXAMINERS

230 Lowry Medical Arts Bldg., Saint Paul 2, Minnesota

Julian F. DuBois, M.D., Secretary

St. Paul Man Convicted of Illegal Possession of Heroin

Re State of Minnesota vs. Horace O. Rae

On December 15, 1950, Horace O. Rae, aged forty-one, 541 Rondo Avenue, St. Paul, Minnesota, was sentenced by the Hon. Robert V. Rensch, Judge of the District Court of Ramsey County, to a term of not to exceed five years in the State Reformatory at St. Cloud, following the defendant's plea of guilty on November 22, 1950, to an information charging him with the illegal possession of heroin. Judge Rensch stayed the sentence and placed the defendant on probation; one of the conditions of probation being that the defendant be hospitalized at the Willmar State Hospital for treatment for drug addiction. According to the records of the Willmar State Hospital, Rae was admitted as a patient on December 15, 1950.

Rae was arrested on November 8, 1950, by agents of the Federal Bureau of Narcotics and St. Paul police officers following an attempt by someone to obtain narcotic drugs on a fictitious prescription that was presented at a St. Paul drug store. The investigation led to the arrest of the defendant, Rae. Rae denied, in Court, that he presented the prescription. He did admit, however, the ownership of heroin found in his room. Rae stated to Police that he purchased the narcotic drugs in Chicago two months previously for $175. The physician whose prescription blank was presented at the St. Paul drug store, denied that he had issued any such prescription to the defendant. He stated that a man resembling the defendant, had been at his office and that he had prescribed a non-narcotic preparation for the patient. He further stated that the patient indicated that a doctor in Ohio had prescribed dilaudid for him. The doctor, however, was unable to positively identify the defendant as the patient.

The Minnesota State Board of Medical Examiners wishes to again caution the medical profession against leaving prescription blanks in their office where they can be picked up by patients. Numerous cases of forged narcotic prescriptions have been uncovered by the Federal Bureau of Narcotics because of such carelessness. This leads to the illegal obtaining of narcotic drugs and to much embarrassment for the medical profession in the investigations that follow. Likewise, the medical profession should pay little or no attention to representations made by patients that some other doctor has prescribed a derivative of opium for the patient. This technique is uniformly followed by addicts who seek to obtain narcotic drugs. The Federal Bureau of Narcotics, for many years, has followed a policy of co-operating with the Minnesota State Board of Medical Examiners and the medical profession. In return, the Medical Board respectfully requests that the medical profession co-operate with the Federal Bureau of Narcotics.

St. Paul Woman Pleads Guilty to Violation of Basic Science Law

Re State of Minnesota vs. Assunda Willner, also known as Sue Willner

On January 5, 1951, Mrs. Assunda Willner, aged forty, 343 W. Central Avenue, Saint Paul, Minnesota, was sentenced by the Hon. Robert V. Rensch, Judge of the District Court of Ramsey County, to serve 60 days in the Ramsey County Jail for practicing healing without a basic science certificate. Mrs. Willner had entered a plea of guilty on December 13, 1950, the matter being deferred for sentence to January 5.

Mrs. Willner was arrested following the filing of a complaint on November 21, 1950, charging her with the crime of abortion. The complaint alleged that the defendant performed an abortion on a 26-year-old unmarried St. Paul woman on or about September 30, 1950. According to a statement made to the St. Paul Police Department by the patient, $400 was paid to the defendant for the abortion. The patient also stated that the abortion was done by the defendant at the defendant's home. Mrs. Willner denied that she performed the abortion and claimed that she simply took care of the patient after she had been aborted.

The defendant has two previous convictions, one for the crime of abortion in 1947, and one for the crime of practicing healing without a basic science certificate in 1942. In the 1942 case the defendant was placed on probation, whereas, in the 1947 case, Mrs. Willner was placed on probation after serving sixty days in the Ramsey County Jail. The defendant holds no license to practice any form of healing.

Minneapolis Woman Placed on Probation for Four Years in Abortion Case

Re State of Minnesota vs. Elsie Mae Perreault

On January 23, 1951, Mrs. Elsie Mae Perreault, forty-four years of age, 2317 Bloomington Avenue South, Minneapolis, was sentenced by the Hon. Levi M. Hall, Judge of the District Court of Hennepin County, to a term of not to exceed four years in the Women's Reformatory at Shakopee. Mrs. Perreault had entered a plea of guilty on January 2, 1951, to an information

In Memoriam

EDWIN S. BROWN

Dr. Edwin S. Brown of Minneapolis died December 9, 1950 at the age of sixty-seven.

Dr. Brown held a bachelor's degree from the University of Minnesota and was a graduate of Pennsylvania Medical School. For six years he was associated with the University of Minnesota Health Service and for the past eighteen years with the Commander-Larabee Milling Company.

Dr. Brown is survived by his wife, Evelyn, and a son, Richard S. Brown, of Minneapolis.

EDWIN B. DAUGHERTY

Dr. E. B. Daugherty, for many years a specialist in tuberculosis in Saint Paul until his retirement fifteen years ago to his home at Marine-on-St. Croix, died December 22, 1950 at Fort Meyers, Florida. He was seventy-three years of age.

Dr. Daugherty was born October 29, 1877.

He graduated from the University of Minnesota Medical School in 1904 and specialized in tuberculosis, having conducted the tuberculosis clinic of the City of Saint Paul over twenty-four years, first at the old Free Dispensary and later at the Wilder Dispensary.

He married May Alness of Saint Paul, who survives him. He was a brother of the late Dr. Louis B. Daugherty of Saint Paul. A son, Edwin B., Jr., died of an acute heart attack while quail hunting in the south. He was serving in the army at the time, during World War II.

WARREN WELSLEY DROUGHT

Dr. W. W. Drought of Fergus Falls passed away November 6, 1950, at the age of eighty-eight.

Dr. Drought was born March 4, 1862, in East Prairie, Minnesota, near Northfield. He graduated from the high school in Owatonna and attended Hamline University. After working for the federal government in river and harbor inspection for some time, he attended the University of Minnesota medical school, from which he graduated in 1891. He took postgraduate work at the New York Graduate School Hospital in 1900, 1901 and again in 1919.

In 1892, Dr. Drought came to Fergus Falls to become associated with Dr. A. B. Cole in the practice of medicine.

On August 23, 1899, Dr. Drought was married to Katherine L. Hovey. They were the parents of five children. Surviving are his wife and three daughters: Mrs. Kenneth Keane of Fergus Falls; Mrs. Frederick C. Markwardt of Crosby-Ironton; and Mrs. John A. Field of Wayzata.

Dr. Drought served for many years as a member of the State Board of Medical Examiners and was chairman of the Otter Tail County Sanatorium Board until his death. He was a member of the Park Region County Medical Society, the Minnesota State Medical Association and the American Medical Association.

KENNETH FRATER

Dr. Kenneth Frater, a former fellow in surgery at the Mayo Foundation, died in Capetown, South Africa, in September, 1950.

Dr. Frater was born at Zunder Paarl, South Africa, on February 5, 1897. He received the degree of M.B. Ch.B. in 1923 from the University of Capetown, South Africa. He served in the heavy artillery in France in World War I. He entered the Mayo Foundation in October, 1925 and left in 1928 with a degree of M.S. in Urology from the University of Minnesota. He practiced urology in Capetown. His wife, Ethel Barrow Frater, was formerly a fellow in pathology at the Mayo Foundation. Her address is: Clent Sunnybrae Road, Rondebosch, Capetown, South Africa.

MERLE R. HOON

Dr. Merle R. Hoon of Pittsburgh, formerly a fellow in surgery at the Mayo Foundation, died August 31, 1950.

Dr. Hoon was born April 3, 1892 at Mercer, Pennsylvania. He received the degree of B.A. in 1914 from Westminster College, New Wilmington, Pennsylvania, and M.D. in 1918 from the University of Pennsylvania. He received the degree of M.S. in Surgery from the University of Minnesota in 1922 and had practiced surgery in Pittsburgh since 1923.

ASA M. JOHNSON

Asa M. Johnson was born January 3, 1870, in Northfield, Minnesota, and died from a cardiac infarction November 19, 1950, at St. Luke's Hospital, Saint Paul, Minnesota.

He received his medical degree from the School of Medicine, University of Minnesota in 1896 and thereafter practiced medicine—a span of fifty-four years—in Saint Paul, Minnesota, until his death.

On July 25, 1917, he married Hazel Perry. His wife and daughter, Mrs. Ellen Elwell, and three grandchildren, Eleanor, Priscilla and Edwin III, survive him.

Although devoting most of his time to general practice, he was fond of obstetrics and he and his brother, Dr. Harland Johnson, conducted an extensive obstetric practice for many years.

He was affiliated with St. Luke's and St. Joseph's Hospitals. He served faithfully on several committees of the Ramsey County Medical Society, attended frequently the meetings of the Minnesota Medical Association and the American Medical Association, of which organizations he was a loyal member and supporter.

SMOOTHER CERVICAL CONIZATION

with the BIRTCHER BLENDTOME

Frequent necessity of cervical repair suggests the practicality of having a BLENDTOME ELECTROSURGICAL Unit in the office or clinic. With this instrument, the doctor is enabled to do a smoother cervical conization. The BLENDTOME cuts and coagulates simultaneously with a blended current. Scar and other tissue is cut through quickly and easily; blood and lymph vessels are almost instantly sealed. The cleaner field results in reduced trauma and operative shock, smoother convalescence and more rapid healing.

The Birtcher BLENDTOME was *designed* for use in the doctor's office or private clinic. It provides electrosurgery for all but the strictly major cases. There are many everyday uses for the BLENDTOME—any case indicating fast and sure cutting with simultaneous sealing off of blood and lymph vessels.

Consider how much more you would be able to do with the ease, timesaving and effectiveness of a Birtcher BLENDTOME in your own office. Write for literature.

ASA M. JOHNSON

(Continued from Page 170)

In recognition of fifty years in the practice of medicine, the Minnesota State Medical Association presented him with a gold medal in 1946.

He attended the St. John's Episcopal Church and belonged to the Knights Templar, Osman Shrine and Summit Lodge.

Dr. Asa M. Johnson will be missed for a long time not only by his family and colleagues but also by his many patients and friends. He possessed a pleasant personality, was blessed with common sense, used good judgment, and tolerated almost all the frailties of human nature except sloth and deceit.

J. A. Lepak, M.D.

MARSHALL J. MELIUS

Dr. M. J. Melius, a member of the Henry Clinic at Milaca, Minnesota, since August 7, 1950, was killed outright in an automobile accident November 22, 1950, while en route from Milaca to St. Charles.

Dr. Melius was born December 25, 1924, in Quincy township, Minnesota, but had lived in St. Charles since the age of four. He attended Rochester Junior College and obtained his M.D. degree from the University of Minnesot in 1949. He interned at the County Hospital in Milwaukee for a year and took additional training at St. Joseph's Hospital in Saint Paul.

Dr. Melius is survived by his parents, Mr. and Mrs. John Melius of St. Charles.

OSCAR OWRE

Dr. Oscar Owre, who played such a prominent part in the development of urology in this region, died December 21, 1950, at the age of seventy.

Dr. Owre was born in Christiania, Norway, February 13, 1880. He obtained his M.D. degree from Hamline University in 1903 and interned at Minneapolis General Hospital. He took postgraduate work in Vienna and specialized in urology. He had been a Fellow of the American Urological Association since 1912 and of the American College of Surgeons, and had been qualified by the American Board of Urology on its organization. He had been Chief of the Urological Department of the Minneapolis General Hospital, former Chief of Staff at Swedish and Norwegian Deaconess Hospitals and Staff urologist at Northwestern, Abbott and St. Mary's Hospitals and Consulting Surgeon to the Northern Pacific Hospital and Glen Lake Sanatorium. He had been Clinical Assistant Professor of Surgery (Urology) at the University of Minnesota Medical School. He was the first president of the Twin City Urological Society, and a member of Hennepin County Medical Society, Minnesota State Medical Association, American Medical Association, and Minnesota Academy of Medicine. He was also a member of the Minneapolis Club, and Alpha Kappa Kappa and Theta Chi fraternities.

Dr. Owre married Katherine Riis, who survives him along with two sons: Jacob Riis Owre, Dean of the

"... in the minds of men..."

In treating the disorders that exist in the minds of men, psychiatric nursing plays a vital role. Proper care can be given patients only by properly trained psychiatric nurses.

In view of the present shortage of such trained nurses, and the desperate need for them, the Glenwood Hills Hospitals School of Nursing, Neurology and Psychiatry is appealing to you physicians for aid in solving this problem.

By sending us the name of a promising nursing candidate in your community—a girl aged seventeen or over, with a high school education—you will be doing your part to alleviate this critical nursing shortage.

Our one-year course in psychiatric nursing is tuition-free. Our graduates have an excellent professional career before them.

Please send the name of a potential nursing recruit to

CLARENCE WILBUR TAYLOR

Dr. Clarence W. Taylor of Duluth died December 15, 1950 following a long illness.

Dr. Taylor was born in Somerset Center, Michigan, October 19, 1874. While a boy he moved to Duluth with his parents and attended Central High School in Duluth. He obtained his medical degree from Northwestern Medical School, Chicago, in 1900 and practiced at Two Harbors, Minnesota, in 1900 and 1901 before opening an office in Duluth.

Dr. Taylor had been assistant city health officer for the past thirty-eight years and acted as epidemiologist for Duluth.

He married Lulu Davis who with a son, Richard, survives him. He is also survived by his mother, Mrs. Asher Taylor of Duluth, two brothers, Lyman of Willoughby, Ohio, and Asher of Saint Paul and a sister, Mrs. Arthur Hanford of Duluth.

Dr. Taylor was a member of the Methodist Church, the Glen Avon Masonic Lodge, the Duluth Scottish Rite bodies and the St. Louis County Medical Society, the Minnesota State and the American Medical Associations.

MINNESOTA STATE BOARD OF MEDICAL EXAMINERS

charging her with the crime of abortion, and a previous conviction for a similar offense. Because of the fact that the defendant suffers from diabetes and is under treatment, Judge Hall placed the defendant on probation for a period of four years. Judge Hall told the defendant that not even her illness would prevent her going to the Women's Reformatory if she violates the law in any manner during the next four years.

Mrs. Perreault was arrested on December 7, 1950, following an investigation by the Minneapolis Police Department and the Minnesota State Board of Medical Examiners. That investigation disclosed that Mrs. Perreault had performed two criminal abortions on November 19, 1950. The abortions were performed at the home of the defendant by use of elm bark. Mrs. Perreault did not ask for any money for performing the abortions and was not paid any money. The defendant has a prior conviction for a similar offense, having pleaded guilty on December 30, 1948, to an information charging her with the crime of abortion and having been sentenced on January 17, 1949, for that offense. Mrs. Perreault has no license to practice any form of healing in the State of Minnesota.

◆ Reports and Announcements ◆

AMERICAN ACADEMY OF GENERAL PRACTICE

An outstanding program is being offered to those who will attend the annual assembly of the American Academy of General Practice at the Civic Auditorium, San Francisco, March 19 to 22.

An effort has been made to have the scientific program different from the usual in that it will deal with problems peculiar to general practitioners as family physicians, with emphasis on family problems and psychosomatic disorders. Approximately half the scientific exhibits will relate to and supplement the formal teaching periods. The program contains the names of outstanding authorities from the country at large, and the titles are well chosen.

All members of the AMA are invited to attend. There is no registration fee for members: nonmembers are required to pay $5. Residents, interns, medical students and nurses will be admitted without charge upon presentation of credentials. AMA members engaged in general practice are invited to apply for Academy membership. Further details may be obtained from the headquarters of the American Academy of General Practice, Broadway at 34th Street, Kansas City, Missouri. Some will want to obtain information in regard to the AAGP Hawaiian Holiday by sea and air, to follow the meeting.

AMERICAN CONGRESS OF PHYSICAL MEDICINE

The American Congress of Physical Medicine will hold its twenty-ninth annual scientific and clinical session September 4, 5, 6, 7 and 8, at the Shirley-Savoy Hotel, Denver, Colorado. Scientific and clinical sessions will be given on the days of September 4, 5, 6, 7 and 8. All sessions will be open to physicians and other professional personnel. In addition to the scientific sessions, the annual instruction seminars will be held September 4, 5, 6, and 7. These seminars will be offered in two groups. One set of ten lectures will consist of basic subjects and attendance will be limited to physicians. One set of ten lectures will be more general in character and will be open to physicians as well as to therapists, who are registered with the American Registry of Physical Therapists or the American Occupational Therapy Association. Full information may be obtained by writing to the American Congress of Physical Medicine, 30 North Michigan Avenue, Chicago 2, Illinois.

CHICAGO MEDICAL SOCIETY CLINICAL CONFERENCE

The Chicago Medical Society's annual clinical conference will be held at the Palmer House, Chicago, March 6 to 9. The scientific program this year will cover a wide variety of subjects, including ACTH and cortisone, skin diseases, fractures, obstetrics, blood banks, x-ray and laboratory tests.

Registration fee is $5. Hotel reservations should be made directly to the Palmer House.

COURSE IN DISEASES OF THE CHEST

The fourth annual Postgraduate Course in Diseases of the Chest, sponsored by the American College of Chest Physicians, Pennsylvania Chapter and the Laennec Society of Philadelphia, will be presented at the Hotel Warwick, Philadelphia, Pennsylvania, March 26 to 30.

This course will emphasize the recent developments in all aspects of the diagnosis and treatment of chest disease. The course is open to all physicians; however, the number of registrants will be limited. The tuition fee is $50, and applications will be accepted in the order in which they are received. Applications should be sent to the American College of Chest Physicians, 500 North Dearborn Street, Chicago 10, Illinois.

NATIONAL GASTROENTEROLOGICAL ASSOCIATION 1951 AWARD CONTEST

The National Gastroenterological Association announces its annual Cash Prize Award Contest for 1951. One hundred dollars and a certificate of merit will be given for the best unpublished contribution on gastroenterology or allied subjects. Certificates will also be awarded those physicians whose contributions are deemed worthy.

Contestants residing in the United States must be members of the American Medical Association. Those residing in foreign countries must be members of a similar organization in their own country. The winning contribution will be selected by a board of impartial judges, and the award is to be made at the annual convention banquet of the National Gastroenterological Association in September, 1951.

Certificates awarded to other physicians will be mailed to them. The decision of the judges will be final. The Association reserves the exclusive right of publishing the winning contribution, and those receiving Certificates of Merit, in its Official Publication, *The Review of Gastroenterology*.

All entries for the 1951 prize should be limited to 5,000 words, be typewritten in English, prepared in manuscript form, submitted in five copies accompanied by an entry letter, and must be received not later than June 1, 1951. Entries should be addressed to the National Gastroenterological Association, 1819 Broadway, New York 23, N. Y.

CANCER FILM AVAILABLE

The availability of a new medical motion picture entitled "Gastrointestinal Cancer: The Problem of Early Diagnosis" has been announced by Dr. Arthur H. Wells of Duluth, president, Minnesota Division, American Cancer Society. Produced jointly by the American Cancer Society and the National Cancer Institute, this new film is the latest in a distinguished series of lay and professional films first released in 1949.

Dr. Wells pointed out that digestive system cancers account for more than one-fourth of all cancers, and cause about one-half of all cancer deaths. In the

The Stability . . .
OF INCOME

One characteristic usually associated with a bond is that it has an established rate of interest; the investor therefore can compute the annual income he may expect from the date of purchase to the date of final maturity. A bond, like a note or mortgage, is a promise to pay a stipulated amount at a designated future date with interest to accrue in the meantime. This provides STABILITY OF INCOME—once a sound investment is made the annual income is fixed and is not altered by changing economic conditions or market fluctuations.

During the past several years, however, this STABILITY OF INCOME has been impaired by increasing Federal income taxes. The income that invested savings earn, when subject to such taxes, does not enjoy complete STABILITY OF INCOME since a change in the tax rate requires an adjustment in actual "spendable" income received—if taxes rise the effective income is reduced.

Because the income from Municipal Bonds is exempt from present Federal income taxes, Municipal Bonds enjoy a STABILITY OF INCOME not available to investments having taxable income.

We invite you to investigate the advisability of placing your savings in Municipal Bonds, one of the oldest and most widely employed means of investment, and we suggest you write for a copy of our free pamphlet and an example of Municipal Bonds currently available for your investment funds.

United States, each year, they cause the death of about 47,000 men and 38,000 women.

It is pointed out that this motion picture has been designed to teach that only the physician's high index of early suspicion followed by an accurate diagnosis makes possible the effective treatment of the cancer patient.

The American Cancer Society points out that this film, like its predecessors, uses sound, color and animation to underscore the importance of early diagnosis and treatment. The picture is rich in clinical material. One of the high spots is the camera's record of what can be seen through the proctoscope and the gastroscope. Both normal and abnormal conditions are shown.

The film stresses the theme "Early gastric cancer is probably more difficult to discover than early cancer in any other body site." The five sites of gastrointestinal cancer discussed are esophagus, stomach, small intestine, large intestine and rectum.

The x-ray series, the narrator concludes as the film closes, is "the physician's most reliable diagnostic procedure in the search for gastrointestinal cancer—a procedure which may bring to light an early cancer located anywhere in the gastrointestinal tract—an early cancer and a curable cancer."

The film ends on the theme of previous films in this series: "Only the physician's high index of early suspicion, followed by accurate diagnosis, makes possible the effective treatment of the cancer patient."

POSTGRADUATE ASSEMBLY OF THE COLLEGE OF MEDICAL EVANGELISTS

The postgraduate assembly sponsored by the Alumni Association of the College of Medical Evangelists in Los Angeles will be held at the Biltmore Hotel, Los Angeles, on March 11 to 16.

The six-day convention is especially geared to the needs of the general practitioner. Last year more than 1,000 doctors from California alone attended. Faculty members from the medical schools of the western states and from some midwest schools will present the scientific program.

Three days will be devoted to scientific papers, exhibits and motion pictures; three to practical, special courses in the various specialties, to be given on the campus of the College of Medical Evangelists in Los Angeles. The registration fee for the convention is $10, and for the special courses, $15.

Further information may be obtained from Dr. Jerry L. Pettis, Managing Director, White Memorial Hospital, 312 North Boyle Avenue, Los Angeles 33, California.

POSTGRADUATE COURSE IN PULMONARY DISEASES

A postgraduate course in pulmonary diseases, sponsored by the American Trudeau Society in co-operation with the Marquette University School of Medicine, will be held in Milwaukee, March 26 to 31. The course is intended for physicians who have a special interest and training in pulmonary diseases and who reside in the north central states. Sessions will be held at Marquette University School of Medicine in Milwaukee.

The registration fee is $50, and physicians who are interested should write to the Scholarship Committee, Wisconsin Anti-Tuberculosis Association, 1018 North Jefferson Street, Milwaukee 2, Wisconsin.

TEACHING SEMINAR IN PROCTOLOGY

The International Academy of Proctology will present its first teaching seminar on proctologic subjects, including the more recent developments, in the form of a symposium and round-table discussion.

The session will be held in New York City, April 7.

Registration for the seminar will be limited in number and open to licensed physicians who are members of the American Medical Association; State or County Medical Associations and graduates of an approved medical school. Admission to the seminar will be by card only. Preference in registration will be given to those affiliated with the International Academy of Proctology.

For registration or further information communicate with Dr. William Lieberman, Chairman, Seminar Committee, International Academy of Proctology, 1819 Broadway, New York 23, N. Y.

A DISTINGUISHED BAG

CONTINUATION COURSES

Fractures and the Surgery of Trauma.—A course in fractures and the surgery of trauma will be presented for general physicians and surgeons at the Center for Continuation Study by the University of Minnesota March 1 to 3. Dr. Carl E. Badgley, professor of surgery in charge of orthopedic surgery, University of Michigan, will be the visiting faculty member for the course and will also present the annual Clarence M. Jackson Lecture sponsored by the Phi Beta Pi Medical Fraternity. The subject of the Jackson Lecture will be, "Fractures About the Hip—Early and Late Therapy." All interested physicians are invited to attend this lecture.

Pediatrics for General Physicians.—The University of Minnesota announces a continuation course in pediatrics to be presented March 26 to 28 at the Center for Continuation Study. The course is intended for general physicians and will be devoted to the fields of infectious diseases and common orthopedic problems in infants and children. Visiting faculty members for the course will be Dr. Ralph V. Platou, professor and head of the Department of Pediatrics, Tulane University of Louisiana, New Orleans, and Dr. William L. Bradford, Associate Professor of Pediatrics, University of Rochester, New York.

Diseases of the Blood in Infancy and Childhood.—Doctors William Dameshek, professor of clinical medicine, Tufts University School of Medicine, Boston, Massachusetts; Clement A. Finch, associate professor of medicine, University of Washington School of Medicine, Seattle, Washington, and Robert W. Heinle, associate professor of medicine, Western Reserve University School of Medicine, Cleveland, Ohio, will participate in a continuation course on diseases of the blood in infancy and childhood, to be presented at the Center for Continuation Study, April 16 to 18. The course is given under the direction of Doctors Irvine McQuarrie and Charles D. May, Department of Pediatrics, University of Minnesota.

JOHN W. BELL TUBERCULOSIS LECTURE

Dr. David T. Smith, president of the National Tuberculosis Association, will present the sixteenth annual John W. Bell Tuberculosis Lecture before members of the Hennepin County Medical Society on March 5 at 8:00 p. m. His subject will be "Extra-pulmonary Tuberculosis."

The lecture will be given in the auditorium of the North American Life and Casualty Building.

Dr. Smith is a professor of bacteriology and associate professor of medicine in the School of Medicine of Duke University, Durham, N. C. He is the author of many articles on pulmonary infections, brucellosis, tularemia and immunology.

The John W. Bell Tuberculosis Lectureship was established in the Hennepin County Medical Society by the Hennepin County Tuberculosis Association in 1934. It honors the late Dr. Bell, internist, teacher and con-

sultant, who practiced medicine in Minneapolis for fifty-one years.

A joint committee of the Medical Society and the Tuberculosis Association select the speaker and the subject for each lectureship. Members of the 1951 Bell Lecture Committee are Doctors Charles E. Merkert, Thomas Lowry, C. R. Wall, and Gaylord Anderson, representing the medical society; and Doctors E. P. K. Fenger, Robert J. Tenner and Stewart C. Thomson, the tuberculosis association.

POSTGRADUATE SEMINARS IN MINNESOTA

The Minnesota State Medical Association and the University of Minnesota Medical School will present a second series of regional postgraduate seminars for physicians beginning the week of March 19.

Each postgraduate course or seminar series will consist of eight weekly evening meetings, each of approximately two hours' duration. Clinical and full-time members of the faculty of the Medical School and the Mayo Foundation in Rochester will participate in these courses which will emphasize diagnosis and management of those conditions most important to the practicing physician.

The titles of the courses and the Minnesota cities in which each will be presented are as follows:

Dermatology	St. Cloud
Electrocardiography	Mankato
Fractures and Traumatic Surgery	Rochester
Gynecology	Alexandria
Obstetrics	Bemidji
Pediatrics	Duluth

Tuition for the courses will be $25.

In addition, the Minnesota State Medical Association and the University of Minnesota Medical School will again participate along with the Minnesota Department of Health, the Minnesota Cancer Society, and the Minnesota Heart Association in presenting postgraduate seminars in cancer, cardiovascular diseases, and psychosomatic medicine for physicians in the areas surrounding Slayton and Albert Lea. There is no tuition fee for these seminars, since they are given with the financial support of the Minnesota Department of Health Cancer and Heart Disease Control Divisions.

SAINT PAUL SURGICAL SOCIETY

The Saint Paul Surgical Society held a dinner meeting at the Minnesota Club, Saint Paul, on the evening of January 17 in honor of Dr. Owen H. Wangensteen and his development of intestinal decompression over the past twenty years. Over 200 members and their guests attended.

Dr. Alfred Blalock, chief surgeon of Johns Hopkins Medical School, was the guest speaker and discussed the subject of cardiac surgery, of which he has been one of the pioneers. His address included a color motion picture of his operation of commisurotomy for mitral stenosis.

Following his address, he paid tribute to Dr. Wangensteen and his outstanding work at the University of Minnesota Medical School, and he emphasized the benefits to patients in the relief of pain and avoidance of

operation resulting from the intestinal decompression procedure. He took advantage of the occasion to present Dr. Wangensteen with a colored reproduction of a painting of Dr. William Stewart Halstead of Johns Hopkins. In a lighter vein he also presented him with a photograph of himself fitted with a nasal tube in action and with inscribed words suggested by the poet Ogden Nash: "May I find my final rest in Owen Wangensteen's intestine, knowing that his masterly suction will assure my resurrection." We trust that Mr. Nash will not object to the repetition of his hastily thought-up legend.

BLUE EARTH COUNTY SOCIETY

At a meeting of the Blue Earth County Medical Society in Mankato on December 18, Dr. M. I. Howard was elected president of the organization. Other officers elected include Dr. Benjamin Geurs, vice president, and Dr. William Chalgren, secretary-treasurer. All officers are from Mankato.

BLUE EARTH VALLEY SOCIETY

Dr. E. E. Zemke, Fairmont, was named president of the Blue Earth Valley Medical Society at a meeting of the group late in November. The society includes physicians of Martin and Faribault Counties. Also named to office were Dr. George Drexler, Blue Earth, vice president, and Dr. Herbert Boysen, Madelia, re-elected secretary-treasurer.

Guest speaker at the meeting was Dr. Edmund Flink, of the University of Minnesota, who discussed cortisone.

RED RIVER VALLEY SOCIETY

At the annual business meeting of the Red River Valley Medical Society in Crookston on December 19, Dr. Lester N. Dale, Red Lake Falls, was elected president of the group for 1951. Dr. Adrian R. Jensen Crookston, was named vice president, and Dr. R. O. Sather, Crookston, was re-elected secretary-treasurer.

Two new members were received into the society: Dr. Alan McKaig, Red Lake Falls, and Dr. Dan Valenti, Thief River Falls.

SAINT LOUIS COUNTY SOCIETY

Members of the St. Louis County Medical Society at a meeting in Duluth on December 14 named Dr. P. F. Eckman, Duluth, president-elect of the organization. At the meeting Dr. O. L. McHaffie, Duluth, took over as president for 1951.

The society, which elects officers a year in advance, also named to office Dr. F. R. Kotchevar, Eveleth, vice president, and Dr. R. H. LaBree, Duluth, secretary-treasurer.

Principal speaker at the meeting was Dr. Harold S. Diehl, dean of medical sciences at the University of Minnesota, who presented his observations during a recent survey of the British medical system.

Woman's Auxiliary

RED RIVER VALLEY AUXILIARY MEETS

The December meeting of the Red River Valley Medical Auxiliary was held at the home of Dr. and Mrs. Martin Janssen, Crookston. The meeting followed a joint dinner meeting with the Red River Valley Medical Society at the Crookston hotel.

Auxiliary members remained after the dinner to hear an address by F. Manley Brist, St. Paul attorney.

Mrs. J. F. Norman, Crookston, presented a report on public relations, followed by a report on the TB essay contest by Mrs. C. L. Oppegaard, president. The magazine subscription contest report was given by Mrs. Martin Janssen. Mrs. C. G. Uhley and Mrs. O. G. Behr were appointed on the nominating committee for the coming year.

CHAIRMAN REPORTS SUBSCRIPTION INCREASE

Mrs. P. S. Rudie

The Bulletin chairman reports a decided increase in subscriptions to the Auxiliary textbook, but not nearly enough. This valuable textbook or manual should be in the possession of every active working auxiliary member.

Send in a subscription today.

HENNEPIN COUNTY PLANS BUSY YEAR

Mrs. Virgil J. Schwartz, President

The Woman's Auxiliary to the Hennepin County Medical Society opened the calendar year with a tea at the home of Mrs. Clyde Cabot, October 6, 1950, commemorating its fortieth anniversary. Honor guests were Mrs. Walter Judd, Washington, D. C.; Mrs. Harold Wahlquist, President-Elect, Woman's Auxiliary to the American Medical Association; and fifty-eight new members.

Mrs. Robert P. Caron entertained the auxiliary members at a dessert luncheon on November 3, 1950. At this meeting a memorial was held for the President-Emeritus, Mrs. W. J. Byrnes, who died October 21, 1950. She was the first president of Hennepin county auxiliary, and was an active member throughout the years. On November 8, 1950, under the direction of Mrs. Henry Quist, Sr., members assisted in assembling the Christmas Seal letters for the Hennepin County Tuberculosis Association. Thursday and Friday, November 9 and 10, 1950 were devoted to the sale of articles made by Glen Lake patients at the sanatorium. The sale netted $2,700, the proceeds going to the patients. Mrs. Frank T. Cavanor and Mrs. F. H. K. Schaaf acted as chairmen.

The December 1 meeting was held at General Hospital, where an interesting musical program, including the Nurses' Choir of General Hospital, was presented.

On January 5, 1951, the New Year's luncheon was held at the clubhouse of the American Association of University Women. The regular formal program followed, featuring a talk on the history of music by Mr. Wilbur F. Swanson, formerly professor of music at Gustavus Adolphus College.

CHAIRMAN URGES MORE SUBSCRIPTIONS

Mrs. O. M. Heiberg

The slogan for this year is *"Today's Health* in every doctor's office—every AMA member a subscriber." It is important that each member follow through and be personally responsible for finding out if *Today's Health* is in her doctor-husband's office. The magazine is excellent as a gift subscription to a friend, or it could be placed in a public gathering place such as a train depot, beauty shop or barber shop.

This subscription drive is the responsibility of each auxiliary member. Promotion of the sale of this periodical has been urged by the National auxiliary. Members should become familiar with *Today's Health.* Subscriptions can be sent to the county *Today's Health* chairman or to Mrs. O. M. Heiberg, 604 Lake Avenue, Worthington, Minnesota.

PERIPHERAL NEURITIS

(Continued from Page 147)

pears to develop when there is a greatly increased spinal fluid pressure.

Summary

Two cases of generalized peripheral neuritis secondary to polycythemia vera have been described. Although the complaints of numbness and tingling in the extremities are frequent in polycythemia, the occurrence of objective peripheral neuritis is rare. Other neuropsychiatric complications in polycythemia vera are frequent. Many vague and nonfocal neurological symptoms occur. Focal neurological lesions are less common but of more serious nature and are usually due to vascular thromboses. Certain features of polycythemia which may easily lead to errors in diagnosis are emphasized.

Profession

N. P. BENSON OPTICAL CO.
Laboratories in Minneapolis
and
Principal Cities of Upper Midwest

A recent report shows that Minnesota is the nation's No. 3 state for longevity. Since 1920, twenty years have been added to male expectancy and thirteen years to female expectancy. Key factors in the longer life span are wonder drugs, preventive medicine, improved treatment and a higher standard of living.—Christmas Seal Health Release.

Of General Interest

The Diabetes Detection Survey undertaken during the week of November 12, 1950, was particularly successful in Minneapolis. During the week 24,346 specimens of urine were deposited at conveniently located drug stores and were tested at the City Health Department's laboratory. Of this number, 534 were reported positive, and the individuals concerned were notified and advised to consult their family physicians. It was reported by 139 physicians that the survey was instrumental in discovering forty-six previously unknown diabetics and thirty-five others who already knew of the existence of diabetes.

* * *

Dr. Paul Klemperer, of Mt. Sinai Hospital, New York, will deliver the annual Phi Delta Epsilon Lecture at the Museum of Natural History, University of Minnesota, at 8:15 p.m. on April 5. His subject will be "The Concept of Collagen Diseases."

* * *

Dr. Paul J. Keith, formerly of Saint Paul, joined the staff of the Henry Clinic in Milaca on December 18. A graduate of the University of Minnesota Medical School, Dr. Keith served his internship at the Denver General Hospital, Denver, Colorado.

* * *

Sister Elizabeth Kenny sailed for England on the Queen Mary on December 16. After holding final conferences with Kenny Foundation workers in England, Czechoslovakia, Germany, Belgium, Ireland and France, she planned to sail for her native Australia on January 4.

* * *

Medical experts from California and Denmark delivered three special lectures at the **University of Minnesota** during January and February.

Dr. Johannes Clemmesen, director of the Danish Cancer Registry and professor of pathology at the University of Copenhagen, Denmark, presented the George Chase Christian Lecture in cancer research on January 18. He spoke on "Research in Human Cancer, Problems and Results."

Dr. Horace W. Mogoun, professor of anatomy at the new school of medicine at the University of California at Los Angeles, discussed "Wakefulness and Sleep" when he presented the annual J. B. Johnston Lecture in neurology on January 30.

Dr. Emil Holman, professor in surgery at Stanford University, gave the eighteenth annual E. Starr Judd Lecture in surgery on February 15. His topic was "Surgical Treatment of Constrictive Pericarditis."

* * *

Dr. L. R. Lima, of Montevideo, attended a clinical chemistry course at the University of Minnesota on December 7, 8 and 9.

* * *

It was announced late in December that **Dr. Harris T. Hinderacker** would open offices for the practice of medicine in Bird Island during the first week of January. A graduate of Northwestern University, Dr. Hinderacker served his internship at Ancker Hospital, Saint Paul.

* * *

General Motors has announced the establishment of a $1,500,000 research project to promote better health for its 446,000 employes as well as those of all American industry. It has established in conjunction with the University of Michigan the Institute of Industrial Health at Ann Arbor, the objectives of which will be research, education and service in industrial medicine, health and safety. Five hundred thousand dollars of the sum allocated will be used for equipment, and $100,000 a year for ten years is to be allocated to meet the expenses of fellowships, scholarships, additional faculty, refresher courses, and the like—all devoted to the betterment of the health of workers.

* * *

Dr. J. K. Hartjen has moved into new offices in Bemidji. His present offices are located at the corner of Fifth and Beltrami Avenue.

* * *

Dr. John F. Briggs, Saint Paul, was principal speaker in behalf of the Minnesota Heart Association for the launching of the 1951 drive for funds in Hennepin County and Ramsey County in January. The meetings were sponsored by the Minnesota State Life Underwriters.

* * *

Dr. A. S. Brussell has been approved by the Dean's Committee of the Southwestern Medical School, Dallas Branch of the University of Texas, and appointed to the position of chief of professional services, Veterans Administration Hospital, Dallas, Texas. Prior to this appointment he was chief medical officer at the Veterans Administration Regional Office in San Antonio.

* * *

Dr. E. M. Hammes, Saint Paul, was principal speaker at the Appreciation Day for Dr. E. C. Gaines of Buffalo Lake on December 10. At ceremonies honoring Dr. Gaines for fifty years of medical service in the area, Dr. Hammes spoke on "The Family Physician."

* * *

According to the **Public Health Service,** more cases of whooping cough were reported during 1950 than in recent years—a total of 118,797 cases. Disease rates, however, for diphtheria, smallpox and typhoid declined. There were only thirty-four cases of smallpox in the country in 1950, compared with 48,907 in 1930.

* * *

Dr. Russell M. Wilder, former head of the Department of Medicine at the Mayo Foundation and senior medical consultant at the Mayo Clinic, has been ap-

TEACHING FACULTY—ATTENDING STAFF OF COOK COUNTY HOSPITAL
Address: REGISTRAR, 427 South Honore Street
Chicago 12, Illinois

* * *

Mr. William Griffiths, who has served as director of the Division of Public Health Education since the division was created in 1946, left in January for the University of California to be on the faculty of the School of Public Health. He had been with the Department of Health since 1940. Before assuming directorship of the Division of Public Health Education, he served as a health educator in the Division of Preventable Diseases and as supervisor of the unit of Health Education Services.

* * *

Dr. George E. Moore, a member of the Department of Surgery at the University of Minnesota Hospitals, was awarded the Samuel D. Gross prize by the Philadelphia Academy of Surgeons for his work in devising a test for locating brain and spinal cord tumors. A radioactive dye injected into a vein concentrates in tumor tissue, which can then be located by means of a Geiger counter.

* * *

Dr. Paul B. Magnuson, medical director of the Veterans Administration since 1948, was replaced by Vice Admiral Joel T. Boone on January 15. Dr. Magnuson's resignation has been in the hands of Administrator Carl R. Gray for the past two and one-half years and has now been accepted. The two have been at variance, it is said, on administrative policies.

* * *

The Minnesota State Association of Life Underwriters is participating with the Minnesota Heart Association in the **1951 Heart Campaign** on a statewide basis. Nine area vice chairmen have assumed responsibility for the campaign in their given territories. Where local heart committees are functioning the Life Underwriters offer their co-operation and services to the existing committees. In other localities Life Underwriters are acting as chairmen of the local heart campaign.

* * *

Dr. Ernest Hanson, formerly associated with the Raiter Clinic in Cloquet, has replaced Dr. E. A. Pasek in Carlton. Dr. Pasek, after a year of practice in Carlton, was alerted on December 1 for duty with the United States Air Force.

* * *

Dr. Peter J. Kitzberger has taken a year's leave of absence from the Seifert Clinic in New Ulm to be a resident in obstetrics and gynecology at St. Mary's Hospital, Minneapolis. Dr. Kitzberger became associated with the Seifert Clinic in November, 1948, and he plans to return there in January, 1952.

* * *

Dr. Robert W. Goltz and **Dr. Edward Gudgel** were placed on the honor roll at the last examination conducted by the American Board of Dermatology and Syphilology because of unusually high marks. Both

men were trained at the University of Minnesota, with Dr. Goltz working at General Hospital and the University Hospitals, and Dr. Gudgel at Ancker Hospital, Saint Paul.

* * *

Dr. Walter C. Alvarez, formerly of the Mayo Clinic, has announced the opening of offices at 700 North Michigan Avenue, Chicago, Illinois, with practice limited to consultations in internal medicine.

* * *

Two faculty members from the University of Minnesota School of Nursing, **Thelma Dodds** and **Florence Julian**, are attending a five-month workshop on nursing service administration at the University of Chicago. Miss Dodds is assistant professor of nursing, director of nurses at Charles T. Miller Hospital, Saint Paul, and president of the Minnesota State Board of Examiners of Nurses. Miss Julian is instructor and assistant director of nursing services at the University Hospitals.

* * *

The National Foundation for Infantile Paralysis is offering a limited number of predoctoral and postdoctoral fellowships in medicine and the related biological and physical sciences to candidates whose interest is research and teaching. Candidates for an M.D. or Ph.D. or an equivalent degree are eligible for a year's fellowship with an accompanying stipend of $1,200 to $1,800. Those with an M.D. or Ph.D. or an equivalent degree may obtain one to five-year fellowships with a $3,600 to $7,000 stipend. Applications for the November selection should be received by September 1, 1951. Inquiries should be addressed to the Director of Professional Education, National Foundation for Infantile Paralysis, 120 Broadway, New York 5, New York.

* * *

New part-time medical director of District 8 of the Minnesota Department of Health is **Dr. A. M. Watson** of Royalton. He succeeds Dr. E. J. Simons, formerly of Swanville, now living in Minneapolis. Dr. Watson has practiced in Royalton since 1905.

* * *

Dr. Lloyd F. Sherman, Minneapolis, was the principal speaker at the annual meeting of the Barron-Washburn-Sawyer-Burnett Medical Society at Rice Lake, Wisconsin, in December.

* * *

The Red Lake Falls Clinic has moved into newly remodeled quarters in the Asiala Building at Red Lake Falls. The clinic is staffed by **Dr. L. N. Dale** and **Dr. Allan McKaig.**

* * *

Universities and research centers in sixteen states and Canada have been granted one and one-half million dollars for **infantile paralysis research** and professional education by the National Foundation for Infantile Paralysis, the organization supported by the March of Dimes. Means of prevention of the disease and better methods of treatment of afflicted patients are the main goals sought.

The new grants bring the total spent for research and education by the foundation since 1938 to over 25 million dollars, and for patient care to 102 million dollars.

* * *

The residents of Spring Grove and the surrounding community paid tribute to **Dr. G. M. Helland** at a simple ceremony at the doctor's bedside on December 22. In appreciation of his years of service, a monetary gift and an engraved plaque were presented to the doctor. Dr. Helland began practice at Spring Grove in 1910 and served the community for thirty-five years. Six years ago he was forced to retire because of ill health.

* * *

Dr. Catherine Burns, a native of Albert Lea who has practiced there for slightly more than a year, was named "Woman of the Week" in a feature story about her career in the *Albert Lea Tribune* on December 29. A graduate of the University of Minnesota Medical School, Dr. Burns served her internship at University and St. Barnabas Hospitals, Minneapolis.

* * *

Dr. H. E. Drill of Hopkins was elected president of the Minneapolis chapter of the American Academy of General Practice at a meeting of the organization on December 11.

* * *

Dr. William L. Benedict, Rochester, was the 1950 winner of the Leslie Dana Medal, a national award given for outstanding achievement in preventing blindness. The medal was presented to Dr. Benedict at a dinner in St. Louis on January 26. Dr. Benedict is professor of ophthalmology at the Mayo Foundation.

HOSPITAL NEWS

Results of recent staff elections at several Minnesota hospitals are as follows:

Asbury Hospital, Minneapolis.—Dr. H. A. Alexander, president; Dr. R. B. Potter, vice president; Dr. R. E. Nord, secretary-treasurer.

St. Mary's Hospital, Detroit Lakes.—Dr. William C. Dodds, president; Dr. G. G. Haight, vice president; Dr. Cherry Cedarleaf, secretary-treasurer.

Riverview Memorial Hospital, Saint Paul.—Dr. C. R. Chadbourn, chief-of-staff; Dr. T. A. Lowe, assistant chief-of-staff; Dr. James T. Larson, secretary; Dr. James Travis, records committee chairman.

Bemidji Lutheran Hospital, Bemidji.—Dr. D. H. Garlock, chief-of-staff; Dr. T. P. Groschupf, vice president; Dr. J. K. Hartjen, secretary-treasurer.

Eitel Hospital, Minneapolis.—Dr. Asher White, president; Dr. Joseph Taylor, vice president; Dr. Allan J. Blake, secretary-treasurer. They replaced, in the respective offices, Dr. James A. Blake, Dr. Alton C. Olson and Dr. Melvin B. Sinykin.

St. Luke's Hospital, Saint Paul.—Dr. Warner Ogden, chief-of-staff; Dr. D. C. Deters, chief-of-staff-elect; Dr. C. W. Leverenz, secretary; Dr. C. C. Bell, chief of the surgical section; Dr. Ben Sommers, chief of the medical section; Dr. J. F. Bicek, chief of the obstetrical and gynecological section; Dr. F. A. Thompson, chief of the general practice section.

BLUE CROSS—BLUE SHIELD NEWS

During November, 1950, Blue Shield allowed $201,849.63 on 5,607 cases, covering 24,690 days of medical care in hospitals. Although this is less than the allowances for September or October, it is more than Blue Shield allowed on cases during any month preceding September.

Of the November Blue Shield allowances, $182,854.30 were for 4,130 hospital cases, $18,584.82 for 1,446 office cases, and $410.50 for 31 home cases.

Doctors of medicine participating in the Minnesota Blue Shield plan received $191,353.62 of the November Blue Shield allowances for services to 5,377 Blue Shield patients. Doctors of medicine not participating in the plan received $10,496 for services to 230 Blue Shield patients. Nearly half ($5,064.63) of this $10,496 was received by doctors practicing outside of Minnesota.

Blue Shield is based on the "American Principle of Free Choice," and every Blue Shield subscriber or dependent is free to choose his own doctor. Likewise, each doctor in Minnesota is free to choose whether he will or will not take part in the Blue Shield plan. It's the American way. We recognize that not all persons nor all members of a profession see eye to eye. However, we regret that some doctors of medicine in Minnesota do not take part in the Blue Shield Plan, for it can be only as strong as its supporters—and the more support Blue Shield has, the better opportunity it has to demonstrate the "American Principle of Free Choice."

There are now 2,750 doctors participating in Blue Shield, and the number of persons covered by Blue Shield totalled 394,446 as of November 30, 1950. Minnesota Blue Cross enrollment as of November 30 was 1,025,249.

For 1951, Blue Shield has resolved to clear all correspondence within 72 hours after it comes in. All reports will be streamlined to give more information with less effort. Allowance checks will be mailed within two weeks after the service report form is received. (Cases that require additional information or checking will naturally take longer; however, a report will be mailed to the physician indicating whatever progress is made on the case, or the reason for delay.)

During February, information for your income tax statements (both state and federal) will be sent to all doctors or clinics to whom Minnesota Medical Service, Inc., has made allowances which require reporting by state or federal tax laws.

RELIABILITY!

For years we have maintained the highest standards of quality, expert workmanship and exacting conformity to professional specifications . . . a service appreciated by physicians and their patients.

ARRHENOBLASTOMA

(Continued from Page 154)

patient experienced a normal pregnancy during an apparently spontaneous remission in function of the neoplasm, prior to its removal. Of additional interest is a six-year follow-up, subsequent to surgical removal of the tumor, during which time no recurrence has appeared and the patient has had two more normal pregnancies.

Addendum

Since the writing of this paper the patient's pregnancy terminated in the spontaneous delivery of a normal female infant. Her postpartum course has been without incident to this time (Feb. 3, 1951).

Grateful acknowledgment is made to Dr. W. V. Knoll, present pathologist at St. Mary's Hospital in Duluth, for his valuable assistance in the study of the microscopic sections and in the preparation of the photomicrographs.

"Truth never grows old" *Thomas Fuller, 1639*

With the passing years, ideas, theories and conceptions may change with new discoveries and growing knowledge.

But truth never grows old.

No matter how widely the pendulum may swing, *truth* remains the center of its path.

Because of its inherent soundness, Dextri-Maltose® is the carbohydrate of choice in more hospitals than ever before. It enjoys the confidence of ever-growing thousands of physicians.

And the physician who prescribes Dextri-Maltose in infant feeding follows a course confirmed by a great mass of evidence, for no other carbohydrate enjoys so rich and enduring a background of authoritative clinical experience.

However the pendulum may swing, facts remain facts, and truth never grows old.

The Balance Sheet

We are all striving mightily to set aside some portion of our income in reserve. This is not an easy task in this day of heavy taxation. Yet these reserves are important; to be used for contingencies that we cannot predict today. It's silly to be forced to stand idly aside and watch those reserves being dissipated through protracted periods of disability when you could have prevented it by the purchase of an outstanding Disability Policy.

It's only logic that indicates that your best plan of income protection is through the plan available to you through your Association.

Tomorrow may be too late—ACT NOW.

Implicit in a happy healthy childhood is maximal nutrition—and one of the essential dietetic guideposts to vigorous adulthood is adequate vitamin C[1,2,9] (¼-4 oz. for infants up to 1 year;[10,11] 4-8 oz. for older children).[4] Fortunately, most every youngster likes the taste of Florida orange juice and the "lift" its easily assimilable fruit sugars* provide.[6] It is well-tolerated and virtually non-allergenic.[3] And, under modern techniques of processing and storage—it is possible for citrus fruits and juices (whether fresh, canned or frozen) to *retain their ascorbic acid content,[5,8] and their pleasing flavor.[7] in very high degree and over long periods.*

FLORIDA CITRUS COMMISSION • LAKELAND, FLORIDA

Citrus fruits — among the richest known sources of Vitamin C — also contain vitamins A and B, readily assimilable natural fruit sugars, and other factors, such as iron, calcium, citrates and citric acid.

. . . plenty of citrus fruit

MULL-SOY *first...*

When it is established that the offending agent in infantile allergy is cow's milk, good nutrition can still be maintained with a milk replacement. Hill recommends, in true milk allergies, a milk-free food such as Mull-Soy, since there are "so many crossed reactions" between the proteins of cow's and other animal milks.*

Mull-Soy is the nutritional replacement of choice for patients, *young or old,* who display a true allergy to animal milks. Mull-Soy supplies (in standard 1:1 dilution) essential protein, fat, carbohydrate and minerals in values comparable to those of cow's and goat's milk. The fat in Mull-Soy is soy oil which is a good source of unsaturated fatty acids and which does not form volatile fatty acids in the intestinal tract.

Mull-Soy is a liquid, palatable, homogenized (vacuum packed) food —easy to take, easy to prescribe. Available in drugstores in 15½ fl. oz. tins.

MEAT...and the ANABOLIC PROCESSES

Providing generous amounts of complete protein essential to the anabolic processes of the human organism, meat is an outstanding protein food for maintaining not only nitrogen equilibrium but also positive nitrogen balance in the patient.

Only in the past two decades has been established the full significance of adequate protein nutrition for supporting the anabolic processes of the organism in physiologic stress.[1] The healing of all types of wounds, repair of regenerating parenchymal organs, detoxification, maintenance of normal fluid balance between the various compartments of the body, growth of replacement tissue in extensive burns, rapid manufacture of antibodies, normal phagocytic response, upkeep of the erythrocyte mass and plasma protein, and support of the enzyme systems are but some of the physiologic processes dependent upon the state of protein nutrition in the patient.

Due to the almost complete absorption of the digestion products of meat protein and its excellent indispensable amino acid balance, the protein of meat participates efficiently in the synthesis of new tissue protein. On the other hand, studies in liver regeneration after partial hepatectomy have shown that incomplete proteins of vegetable origin, fed alone, do not increase the protein of the impaired liver any better than a diet containing no protein.[2]

The high content of biologically complete protein, however, is not the only reason for including liberal amounts of meat in the dietaries of patients requiring a high protein intake. Meat is also an important rich source of iron and valuable amounts of essential vitamins—thiamine, riboflavin, and niacin, and the newly discovered vitamin B_{12} which, among its several functions, promotes the most efficient utilization of protein.

Pure Crystalline Vitamin B_{12}

The Only Form

Of This Important

Vitamin

Official In The U.S.P.

PREFERRED BECAUSE
potency, purity, and lack of toxicity of *crystalline* vitamin B_{12} are clearly established.

Potency: Potency of this U.S.P. product is accurately determined by precise weight.

Purity: Pure anti-anemia factor.

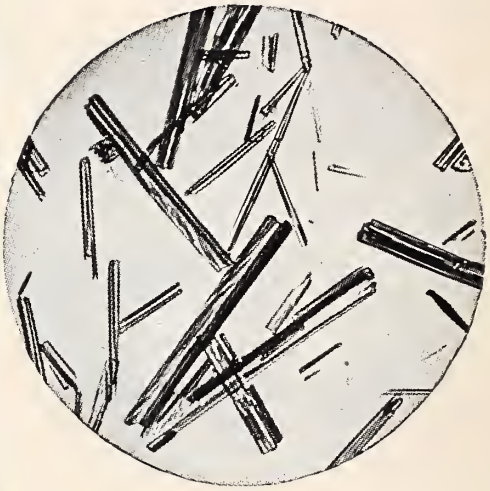
Efficacy: Produces, in microgram dosage, maximum hematologic and neurologic effects.

Tolerance: Extremely well tolerated; "no evidence of sensitivity" has been reported.

Toxicity Studies:

In recent pharmacologic investigations, extremely large doses of *crystalline* vitamin B_{12} (1,600 mg./Kg.) caused no toxic reactions in any of the animals treated. In contrast, 3 mg./Kg. of a "*concentrate*" caused fatal reactions in 100 per cent of the animals treated.

Merck—first to isolate and produce vitamin B_{12}—supplies Crystalline Vitamin B_{12} in saline solution under the trademark Cobione.* Your pharmacist stocks Cobione in 1 cc. ampuls containing 15 micrograms of crystalline vitamin B_{12}.



Crystalline Vitamin B_{12}

* *Cobione is the registered trade-mark of Merck & Co., Inc. for its brand of Crystalline Vitamin B_{12}.*

When Convenience is the Keynote

DEXTROGEN®

For Your Infant Patients

Merely Dilute

Ready to use and in liquid form, Dextrogen is a concentrated infant formula, made from whole milk modified with dextrins, maltose, and dextrose. In addition, it is fortified with iron to compensate for the deficiency of this mineral in milk. Diluted with 1½ parts of boiled water,* it yields a mixture containing proteins, fats and carbohydrates in proportions eminently suited to infant feeding. In this dilution it supplies 20 calories per ounce.

Then Feed

The higher protein content of normally diluted Dextrogen—2.2% instead of 1.5% as found in mother's milk—satisfies every known protein need of the rapidly growing infant. Its lower fat content makes for better tolerability and improved digestibility.

Dextrogen serves well whenever artificial feeding is indicated, and is particularly valuable when convenience in formula preparation is desirable.

---

*Applicable third week and thereafter; 1:3 for first week, 1:2 for second week.

AUREOMYCIN

Lederle

Hydrochloride Crystalline

Effective against many bacterial and rickettsial infections,
as well as certain protozoal and large viral diseases

Every precaution against contamination and every device that will safeguard the quality and sterility of the content of aureomycin in vials for research parenteral use has been adopted in the sterile filling rooms at our Pearl River laboratories. Rigid aseptic technique surrounds the filling process. The actual filling takes place in a stainless steel tunnel equipped with ultraviolet lights. No human hand takes part at any stage, until the plugs are inserted in the vials. Plugging is done inside an ultraviolet irradiated chamber with only the sterile-gloved hand of the operator inside.

Aureomycin is now available in a number of convenient forms, for use locally and by mouth. New forms of this antibiotic of unsurpassed versatility are constantly being perfected.

Capsules: *Bottles of 25, 50 mg. each capsule. Bottles of 16, 250 mg. each capsule.*

War May Hit YOU Twice, Doctor!

1. Uncle Sam won't let you force collection of debts owed you by patients who go into the armed services. You may lose substantially if you fail to act fast to get in money owed you by service-age men and women.

2. If you enter the armed forces yourself, you will need to leave your collections in reliable hands.

In either case, we suggest you check this outline of our service, then fill out and send us the request in the square below.

Here's How the I.C. System Works...

When a patient's bill becomes delinquent you fill out and mail a simple form. We then start a series of procedures designed to induce the patient to pay you *directly* what he owes you. **Note that this is not a collection agency.** The patient pays *you.* Throughout the collection, every effort is made to keep the patient's goodwill and to deflect from you the onus of asking for money. When you have received your money, not before, you remit to us a fee which is less than you would have spent to collect the money through your own efforts and which is approximately half of a collection agency fee. More than 1,000 doctors, hospitals and clinics are already using and can verify the worth of this tested system with the five unique advantages.

5 Unique Advantages

- **It gets the money to you**
- **It keeps patients friendly**
- **It safeguards your own professional dignity**
- **It's a low cost service**
- **It is a reliable service—not a collection agency**

HUMAN RELATIONS—INTERNATIONAL AND LOCAL

WARNER OGDEN, M.D.

Saint Paul, Minnesota

THE appalling succession of international catastrophes which have occurred during the past few months have caused all of us to look upon the future with serious apprehension. We have quite properly been inclined to blame the activities and policies of the postwar years for the mess in which we find ourselves, and certainly the present world crisis has followed hard upon inadequate, unintelligent, and dishonest efforts on the part of the heads of various nations, including our own, to solve international problems. In starting to prepare this address, I had at first a feeling of great futility, a feeling that a discussion of political medicine in the nation, or of medical difficulties in this state, or in this county society, would be totally superfluous.

And yet, as one tries to analyze the world dilemma, the confusion and bickering in Washington, or the minor difficulties in our local medical society, one fact stands out which is all important, one fact stands out which is common to any groups which are interdependent and compelled to work with one another. This fact is the difficult problem of human relations. And no large nations, or small groups, can get along together who do not recognize the vital necessity for the solution of this problem.

Du Nouy, in his book entitled "Human Destiny," presents man as a creature of evolution, slowly struggling up from the swamps of prehistoric time. To me he seems to prove rather effectively that this evolution has not been one of chance, of fortunate mutations, of survival of the fittest. Those species which showed the greatest adaptability, perfected themselves in their own form and eventually attained such a stability, such a suitability for their environment, that they reached a dead-end street in evolution. They finally perished when their environment was suddenly changed by world-wide climatic variations, such as the recurring glacial epochs, by variations in world bodies of land and water, or by inimical forces of other forms of life, varying in size from bacteria to saber-toothed tigers. Man, on the other hand, never became perfectly adapted. His evolution progressed intermittently but always consistently, not by chance but rather as though guided by the plan of some super-intelligence, some power greater than the simple laws of chance, mutation, and survival of the fittest. Man's physical development was achieved many thousand years ago, his intelligence developed rapidly, and was probably about as high among the ancient Egyptians, Chinese, and Greeks, as it is today. The present great scientific advances are chiefly the snowballing effect of utilizing rapidly accumulating stores of knowledge, rather than because we are now brighter than the Egyptians.

But the development of man's spiritual or moral nature has been slower, and is still racially in its early stages. It is true that through the centuries there has been a gradually increasing number who have thought primarily in spiritual or moral terms. It is true also that today there is more evidence of this spark of morality, but nevertheless many show a tendency to revert to the egocentric, amoral, physical creature of their prehistoric ancestry.

Now what has all this to do with human re-

Presidential address before the Ramsey County Medical Society, Saint Paul, Minnesota, January 29, 1951.

lations? Simply this—whether we be Russians or Americans, whether we be Republicans or Fair Dealers, whether we be patients or doctors, most of us have within us the ability to judge wisely, to make sacrifices, to understand and deal fairly with our fellows. And when nations—or politicians—or doctors violently disagree, it is probably due to one of three factors:

1. Lack of sufficient information and knowledge, and an intolerant refusal to learn more about the view of the opposition.
2. Egocentric or selfish reluctance to go part way to meet the other fellow.
3. The existence of relatively small, but vicious and amoral groups of individuals whose greed and ruthlessness stamps them as those whose evolution has not proceeded beyond the stage of the prehistoric man.

The solution of this situation, which is essentially a problem in human relations, is as simple and as frustrating at the international level as it is within our own nation, as it is between medical factions or between you and your patient.

At the county medical society level, we have tried, and I feel with considerable success, to improve human relations. We have done this in several ways:

1. By information and education—through a program of published advertising and radio talks; by making doctors available through our speaker's bureau for various public addresses on medical subjects; by improving relations with the press, the Saint Paul Association, the Community Chest, the Red Cross, and other civic organizations; and by trying to make every individual doctor a sort of ambassador of good will.
2. By trying to make good medical service readily available through the Emergency Medical Service organization.
3. By forming a Grievance Committee which has been able to adjust amicably many misunderstandings as to charges and services, as well as to crack down on a few cases of greed, selfishness, or intolerance on the part of physicians or patients.

Among our own membership we have a few problems. We have the case of the man who wishes full privileges in all the hospitals to do all types of work, even though he be inadequately trained and equipped to do so. A responsible medical society cannot permit such a man to place the health and lives of the public in jeopardy, in order to further his hunger for prestige or dollars. Then we have the super-trained specialist who may fail to appreciate the hard work, personality, and special abilities necessary for the man who is on the firing line in general practice. Many of us like to gripe about the hard work and poor pay from which we suffer in the particular field of medical practice we have chosen. But we forget that we were all reasonably free to choose whatever branch of medicine we wished, if we were willing to work for it, and that in complaining we are actually criticizing ourselves only, either for our lack of foresight in selecting our field, or for our indolence in training for it.

And this brings up another problem which is whispered in cloak rooms but never brought into public meetings—the age old matter of fee splitting. I do not propose to enter into this in detail at this time. I realize that special circumstances frequently affect various situations, and that it is impossible to cover all ramifications of so complex a subject with generalities. However, to use hypothetical illustrations, if I make a night call to catheterize a patient with acute prostatic obstruction and then refer him to a urologist for a transurethral resection, I do not expect to charge a fee in the operating room for turning on the hose to irrigate his bladder. I prefer to make a living in my own field, rather than as assistant water boy to a cystocope. And, if an obstetrician refers to me a case of cholelithiasis, he does not expect to charge a fee for standing at the operating table counting gallstones. He prefers to make a living as an obstetrician rather than as an assistant gallstone auditor. And certainly I think most of us will agree that when a specialist by any means, however devious, seeks to increase his referred work by purchasing it, or when any referring doctor, by any means, however devious, seeks to sell his patients to the highest bidder, these men are bartering in human suffering and have no place in an honorable medical society.

For all these various problems, it is the duty of the Ramsey County Medical Society to seek proper solutions. This is a democratic group where each man has an equal voice and equal opportunity for leadership. And we are fortunate here in having the excellent co-operation of the

Saint Paul Academy of General Practice, the Saint Paul Surgical Society, the Saint Paul Society of Internal Medicine, and other specialty groups, all seeking to improve ethical and scientific standards. And through these organizations, through our various committees, from the floor of these meetings, ample opportunity and channels are provided for discussing and correcting complaints, without resorting to ineffectual letters or cloak room oratory.

The Ramsey County Medical Society is your society. It is a good society because it recognizes its weaknesses and tries to correct them. It is my deep conviction that the physicians in this community as a whole, are outstanding in their professional relations, professional conscience, and professional ability. This is a recognized fact, not only locally, but by many individuals elsewhere in the nation, who are in a position to know. And, at this time, I wish to thank you men, and our various excellent committees, who by your co-operation and help have made this a year of progress. It has been a pleasure as well as an honor to work with you.

But, as stated in the beginning, in this period of world crisis, we cannot think of local matters only. We are more than Ramsey County physicians—we are American citizens. It is as American citizens that we have carried on the fight against socialized medicine. This has been a fight, not to preserve our incomes, but to preserve the personal health and economic integrity of the United States. It has been a fight against the same forces I have previously mentioned, against ignorance, selfishness, and ruthless greed. Senator McClellan of Arkansas has called those in Washington who sponsor state medicine, "Political racketeers in human misery." Dr. E. L. Henderson, President of the American Medical Association, has said, "The violent and vulgar attacks being made on the medical profession by those who would like to see it socialized, are direct evidence that the doctors of America have driven their message home." Those who cannot rally truth to their side usually resort to epithets. This is true in the case of certain labor agitators, of certain Congressional demagogues, and particularly of Oscar Ewing of the Federal Security Agency, even as it is true of Stalin, Mao Tse Tung, and their sycophants.

But, as American citizens, we must do far more than try to protect our own profession from socialization. Abraham Lincoln said, "If the United States is ever destroyed, it will be destroyed from within." That is the thing we must fear, that is the thing we do fear, whether we realize it or not. The inept fumblings with international diplomacy, the vacillating discordancies in formulating world-wide policies during the postwar years, and the present hysterical flutterings in Washington at our present dilemma, can be laid right on the doorstep of the American people, of you and me. The American voter has been influenced by greed, prejudice, intrenched privilege, laziness, rather than by national welfare—and 60 per cent of them have not bothered to vote at all.

Naturally, no one of us knows many of the answers but, certainly, this group of doctors knows the difference between right and wrong, between altruistic and egocentric objectives. It is possible, as Du Nouy suggests, that the human race is still at a primitive evolutionary stage in its development of spiritual and moral standards. It is even possible, as he suggests, that those elements representing the reversion to the ruthless viciousness of prehistoric man, may temporarily carry with them the great amorphous majority, and drive altruism and spiritual leadership into hiding. But, if we believe that the evolution of man is a progressive process, directed by a super-intelligence, we must believe in the ultimate resurgence of man's moral consciousness and spiritual strength.

Governor Langlie of the State of Washington, in a stirring appeal at the recent convention of the American College of Surgeons, called upon the doctors to step forward to their rightful place as leaders in the community. He said we fail to recognize our power and ability, individually and collectively, to influence a large number of people. The cheap politicians in our country and the dictators elsewhere, recognize it—that is why they try to destroy the medical profession by propaganda or concentration camps.

We physicians have a proud heritage. By education, by daily experience in human weakness and strength, by the necessity of dealing in human relations, by the fact that we studied medicine in the first place, we should be and we are singularly equipped to take a place of leadership,

FERTILITY IN CRYPTORCHIDS

CHARLES E. REA, M.D.
Saint Paul, Minnesota

RECENTLY, a patient, twenty-five years old, upon whom I had performed orchiopexies fifteen years ago for bilateral abdominally retained testes, came to my office. Although he had been married four years, his wife had never become pregnant. The patient was concerned about his apparent sterility. Examination revealed the testes to be in the scrotum, but they were about one-third normal size. The secondary sexual characteristics were normal. A biopsy was taken of the right testicle; it showed no spermatozoa, an atrophic epithelium and a greatly increased interstitial stroma. The patient was told that it was unlikely that he would have children of his own and that he and his wife should plan to adopt children.

Because of this case, it was decided to check patients with bilateral undescended testes, who had had orchiopexies at least ten years before, and who were married, to determine their fertility.

Eight patients who had been operated upon at least ten years before for bilateral undescended testes, and who were married, were available for study. Their ages varied from twenty to twenty-five years. There were four patients with bilateral abdominally retained testes, two with bilateral inguinal testes and two in whom one testis was abdominally retained and the other inguinally retained. In six cases, it was mentioned that the scrotum was not developed at the time of operation. Wangensteen's modification of the Keetley-Torek operation was performed in all cases.

All these patients had been married for periods of from six months to five years. In no instance had the wife become pregnant. All these patients stated they were potent. The testes in each instance were in the scrotum, but none was normal in size. The testes were estimated to be one-third to one-half the normal size. Four of the patients submitted to testicular biopsy. The testes had atrophic germinal epithelium, and no spermatozoa were seen in any of the sections. It is interesting that three of the eight patients had consulted their home doctor about their sterility. Examination of the vaginal fluid after intercourse had failed to show spermatozoa in one case; and in another, the home physician reported that he could find no spermatozoa in the seminal fluid.

It is disturbing that all these treated cryptorchids are apparently sterile. On the contrary, Odionne and Simmons, McCollum, and others, have reported instances of fertility in cryptorchids treated by orchiopexy. However, these patients should be reviewed critically as to the time of examination after operation and also as to whether some of these cases may have been pseudocryptorchids.

According to the literature, spermatozoa have never been found in sections of the untreated cryptorchid testes. The sperm counts in treated or untreated cryptorchids never approach the normal, and if the undescended testes are operated upon after puberty and are small, they never attain normal size.

The experience of Sir Astley Cooper should be mentioned. A young medical student with bilateral undescended testes once consulted him about his condition. When Cooper told him he was like a castrate, the student committed suicide. At autopsy, it is stated that spermatozoa were present in both testes. If this is true, it would be a decidedly unusual finding; more likely, Sir Astley was dealing with a case of pseudocryptorchidism in which fertility was retained and not a case of true anatomically retained undescended testes.

There is no question but that placing the undescended testis in the scrotum allows the gonad to develop to varying degrees. The experimental evidence on this point has often been questioned because *normal* testes have been used experimentally: the gonads have been brought from the scrotum to the inguinal region or abdomen and then replaced in the scrotum after degeneration has occurred. The testes have had the normal potentialities all the time. However, Wangensteen has reported the case of a boy, twenty years old,

Presented before the Minnesota Surgical Society, Saint Paul, Minnesota, November 17, 1950.

who had bilateral undescended testes upon whom an orchiopexy was done on both sides. Biopsies were taken at the stages of orchiopexy and at the autopsy twenty months after the final orchiopexy when the boy was accidentally killed. There was evidence of improvement in the germinal epithelium.

On reviewing the literature, one finds extreme differences of opinion: that the patient with undescended testes is always sterile, or that such patients may be fertile. One wonders whether the authors are stating opinions or impressions as facts. Many writers do not distinguish between pseudocryptorchidism and true undescended testes. Pseudocryptorchids commonly have spontaneous descent of the testes with or without hormone therapy. Also these patients are usually fertile. The testes of pseudocryptorchids develop into normal size. On the contrary, in my experience, a true anatomically retained testis never spontaneously descends, and hormone therapy is of little or no value in treating this condition. The farther the testis has descended, the easier it is to do an orchiopexy and the size of the testis determines what can be expected of it. In an older patient, with a small unilateral undescended testis, such testis is better removed as far as function or a cosmetic result is concerned. In bilateral undescended testes, the saving of the testes must be considered for the development of secondary sex characteristics. These characteristics seem to develop equally as well in either the treated or untreated cryptorchid, depending on the development of the testes.

Summary

Eight bilateral cryptorchids were studied as to their fertility. Orchiopexies had been performed at least ten years previously. It was discouraging that clinically at least all these patients were sterile and four of the patients who submitted to testicular biopsy had an atrophic germinal epithelium.

There is confusion in the literature as to fertility of cryptorchids because most authors do not differentiate between pseudocryptorchids and true undescended testes.

In our experience it would seem that the fertility of patients with true undescended testes is more potential than real.

HUMAN RELATIONS — INTERNATIONAL AND LOCAL

(Continued from Page 215)

not merely as doctors, but as American citizens. We must not waste our efforts in petty bickerings or destroy our influence in self-centered practices. We have, perhaps, been a bit too apologetic at times in discussing our profession with opposing groups. In the first part of this century, the doctor was a respected leader in his community. Let us live up to this heritage—let us be proud of our profession, and let us rededicate ourselves in these critical times to our duties as Americans. For only through proper leadership can the United States be strong militarily, intellectually, and spiritually, and, perhaps, in the strength and spirit of America lies the hope of the future. And for our personal consideration as doctors and as Americans, let me close with a familiar quotation from Abraham Lincoln, "I am not bound to win but I am bound to be true, I am not bound to succeed but I am bound to live up to what light I have."

MINNESOTA REPORTS HEART DISEASE

D. S. FLEMING, M.D., M.P.H.
Minneapolis, Minnesota
and
BERNARD WOLCYN, PH.D.
Saint Paul, Minnesota

IT is well known that heart disease in all its various forms has long been the leading cause of death in Minnesota. During 1949, deaths attributed to heart disease alone totaled 9,379—approximately one-third of all deaths in the state. Deaths from heart disease are greatly in excess of deaths from the next highest cause—cancer—which numbered 4,407 in Minnesota in 1949.

Ever since 1914, heart disease has kept its place as the leading cause of death in Minnesota. Through the intervening years, the number of deaths attributed to various forms of heart disease has shown a precipitous rise, increasing 480 per cent during the past forty years. Figure 1 shows the year-by-year increase in deaths from heart disease occurring in Minnesota as well as those registered by residence within the state. As in the case of cancer and other chronic diseases, the rise in number of deaths attributed to heart disease in recent years is due in part to two main causes—the aging of our population and the improvement in medical diagnosis.

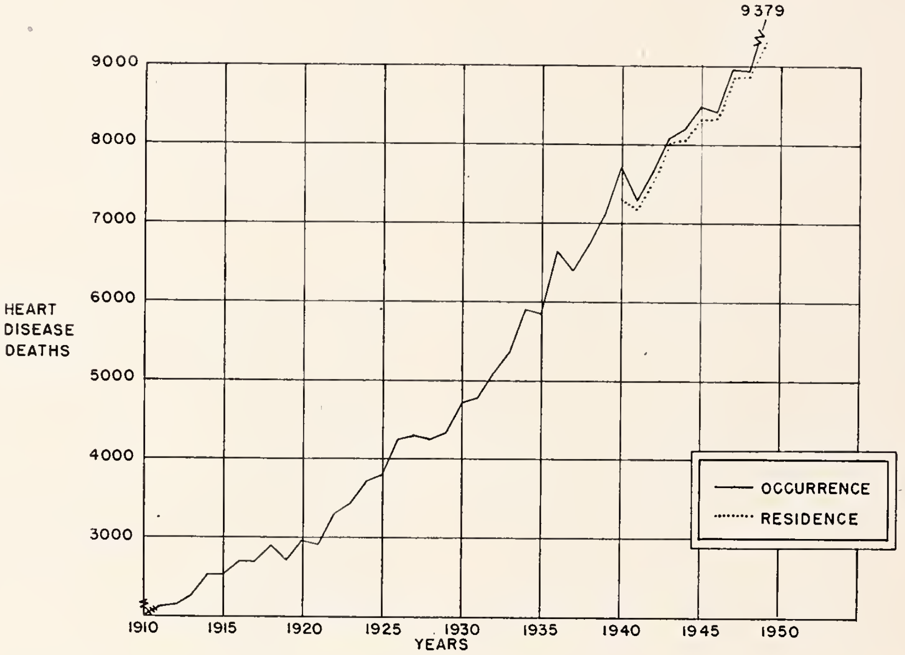

Fig. 1. Deaths from heart disease for Minnesota by occurrence and residence.

Comparing the death rate from heart disease in Minnesota (as shown by figures from the State Department of Health) with that for the nation as a whole, we find that the Minnesota rate has remained consistently lower than the rate for the nation. In 1910, Minnesota's death rate per 100,000 population was 93.2. By 1948 the rate was 315.0 per 100,000, the peak having been reached with a rate of 323.5 in 1945. This in comparison to the 480 per cent increase in numbers of deaths is a 340 per cent increase in death rate. The national figure climbed from 158.9 in 1910 to 322.7 in 1948. The wide gap between the two sets of statistics that was evident during the early years of reporting is now being slowly closed to a point at which the death rate from heart disease in Minnesota at present almost coincides with that of the whole nation. Figure 2 shows this gradual narrowing. In Figure 3 the

Dr. Fleming is Chief of the Section of Preventable Diseases, Minnesota Department of Health, and Dr. Wolcyn is Public Health Consultant, Division of Cancer Control and Heart Disease, Minnesota Department of Health.

death rate from heart disease is shown in relation to the total death rate in Minnesota.

The latter during the period between 1910 and 1950 fluctuated yearly within narrow limits, revealing a slow but gradual trend downward.

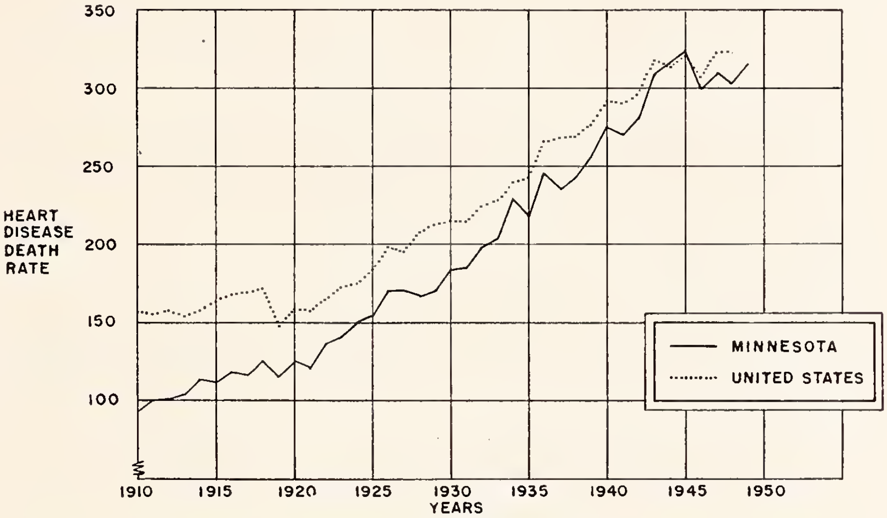

Fig. 2. Heart disease death rate per 100,000 for Minnesota and United States.

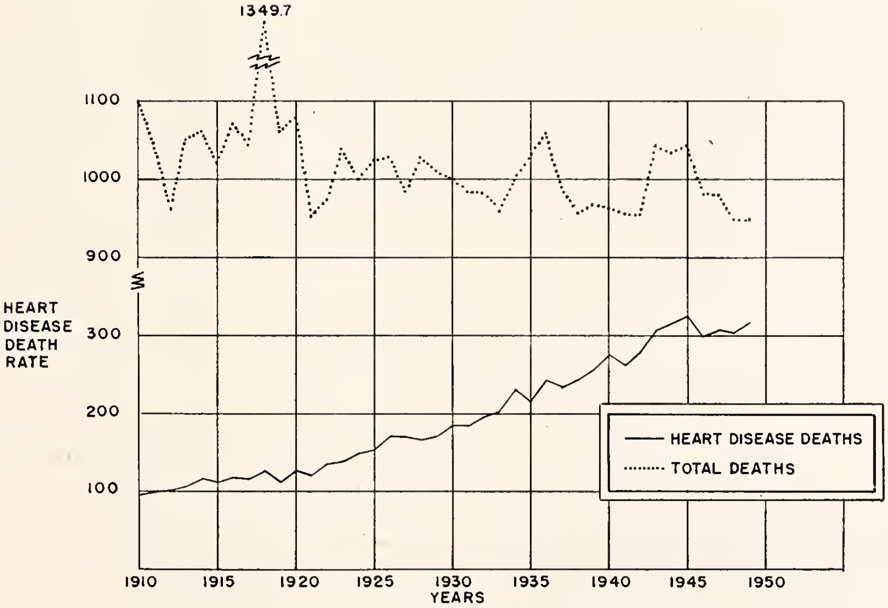

Fig. 3. Heart disease death rate in comparison to total death rate per 100,000 for Minnesota.

Heart disease death rate figures, on the other hand, show a distinct rise over the same number of years. While total death rates are dropping, heart disease death rates are on the increase. Heart disease as a cause of death in Minnesota is now taking about 225 more lives per 100,000 population than in 1910.

Figure 4 depicts the changes apparent during the 1941 to 1949 years, inclusive, in the six groups that make up the general classification of heart disease. These groupings, along with the percentage of all deaths reported for each group in Minnesota from 1943 to 1947, inclusive, are shown in Table I.

TABLE I. PERCENTAGE OF DEATHS FROM VARIOUS HEART CONDITIONS OCCURRING IN MINNESOTA DURING THE YEARS 1943 TO 1947 INCLUSIVE

Disease	Percentage of Deaths by Classification of Total Heart Disease Deaths
Pericarditis	0.1
Acute endocarditis (except rheumatic)	0.4
Chronic affections of the valves and endocardium	10.0
Diseases of the myocardium	38.1
Diseases of the coronary arteries and angina pectoris	43.2
Other diseases of the heart	8.2

Table I and Figure 3 show that coronary disease and angina pectoris take more lives than any other condition in the general classification of heart disease, with myocardial disease ranking second. Both of these groupings show a steady uphill climb, with coronary disease and angina pectoris making the greatest rise. The other four groupings maintained an even pace over the period considered in Table I, with endocarditis and pericarditis occupying minor roles in the total heart disease picture.

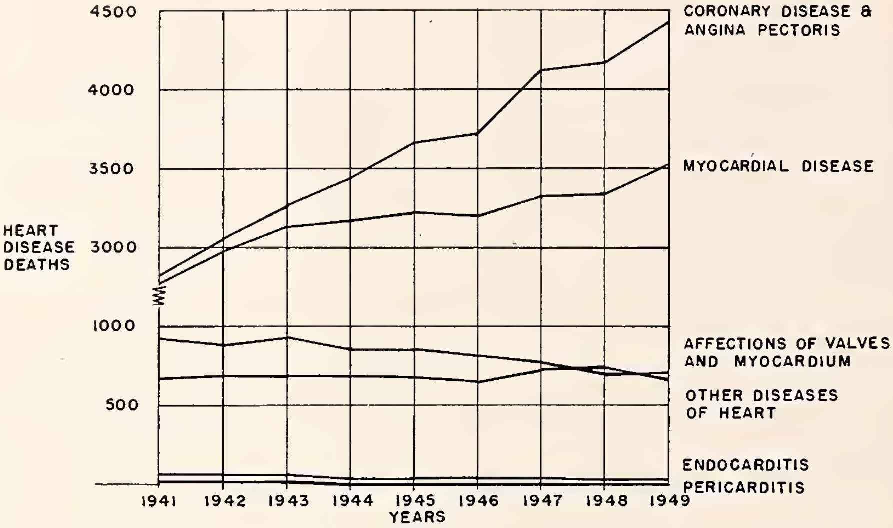

Fig. 4. Deaths from heart diseases for Minnesota by classification.

Summary

The number of deaths from heart disease, the leading cause of deaths in Minnesota, has increased 4.8 times since 1910. The heart disease death rate per 100,000 population has increased 3.4 times in the same period of time.

Heart disease now causes one-third of all deaths occurring in Minnesota.

Diseases of the coronary arteries, angina pectoris, and diseases of the myocardium lead as causes of death in the general category of heart disease.

THE FUTURE OF THE VETERANS ADMINISTRATION MEDICAL PROGRAM

The precipitate resignation of Dr. Paul B. Magnuson as chief medical director of the Department of Medicine and Surgery in the Veterans Administration has occasioned grave concern among all who are interested in the medical care of the veteran, particularly as he has stated in a letter to all doctors in the Department of Medicine and Surgery, that "there was too much interference in the running of hospitals and the authority for running hospitals."

This is a serious indictment. The issues involved can be appreciated only against the background of progress that has characterized the medical program of the Veterans Administration in recent years.

In the Spring of 1945 in Frankfort, Germany, the commanding general of the United States Ground Forces convened with the chief surgeon of the European Theater of Operations and his chief consultant to discuss the future medical care of veterans of the United States Army. It was May, the war in Europe was over and although Japan was still to be conquered, the future seemed full of hope and idealism. Under these propitious circumstances a complete reorganization of the Veterans Administration medical program was envisioned. To replace the archaic and bureaucratic system that had made veterans' hospitals places to be shunned, they planned a decentralized organization not unlike the Army's medical services in the European Theater where the care of the patient took precedence over all other considerations and where hospitals vied with each other for excellence. To make such a program an enduring one, they conceived the idea of linking it to those most stable of human institutions, the universities.

The ensuing years saw much of this concept come to fruition. Congress passed Public Law 293, which freed professional personnel from the restrictions of Civil Service Regulations. The universities supported the plan and took under their guidance the "affiliated hospitals." The names of Omar Bradley, Paul R. Hawley, Paul B. Magnuson, Elliott C. Cutler and Edward Cushing were identified with what Dr. Carroll, elsewhere in this issue of the *Journal,* has called "a transformation without parallel in the medical history of this country." Distinguished men in all branches of medicine were

THE CHRONIC ALCOHOLIC AND ANTABUSE THERAPY

JACK V. WALLINGA, M.D.
Saint Paul, Minnesota

FROM an historical standpoint, it is only recently that alcoholism has come to be considered as a medical problem. For the past twenty centuries drunkenness has usually been thought of as a moral issue and punishable by the same legal action as other crimes against society. That such a punitive attitude has resulted in no improvement in the problem of alcoholism is only too apparent. In passing, it is interesting to recall that as recently as 1918 the Congress of the United States attempted to legislate the problem of alcohol out of existence. In reality the past twenty-five years have, for the first time, seen beginning attempts to attack the problem of alcoholism in the same scientific spirit that has obtained in the conquest of other diseases. From the medical standpoint it follows that the abnormal use of alcohol must be considered as a disease process if progress is to be made in its solution. One of the most recent attempts to treat alcoholism by means of a chemical agent is presented here.

The problem that is created by alcoholism, both socially and economically, is large. It is estimated that there are 750,000 people in this country who are confirmed, chronic alcoholics. There are almost 3,000,000 other excessive drinkers who border on chronic alcoholism.[11] The economic problem attributable to alcoholism in a single year is estimated at $432 million in potential wage losses; crime $188 million; accidents $89 million; hospital and medical care $31 million; and $25 million for the maintenance of drunken persons in local jails—a total of $765 million—and this still does not take into account the costs that cannot be figured in dollars: broken homes, deteriorated personalities, the damage done to good minds which otherwise would be capable of contributing positively to society.[6]

What is this disease for which the cost is so high? While the state of present knowledge permits no dogmatic statements with regard to etiology, it is felt that one of the major contributing factors is in the emotional area. Alcohol seems to serve a need similar to that of many neurotic symptoms in that it is effective in shielding from painful realities and unpleasant internal tensions. Menninger speaks of the phenomenon of self-destruction which occurs by irresistible addiction to repeated, excessive drinking of alcohol. We know of persons who, on their way to attempt suicide, have stopped for a drink and after a while, and several drinks, have forgotten for the time their original goal. Psychologically, alcohol addiction may be considered a form of self-destruction used to avert a greater self-destruction stemming from inner conflicts of which the person is only vaguely aware if at all. Such conflicts may take many forms, such as deep feelings of guilt, need for punishment, uncontrollable feelings of hostility, et cetera. Its further quality is that in a practical sense the self-destruction is accomplished in spite of and at the same time by means of the very device used by the sufferer to relieve his pain and avert this feared destruction.[15]

Alcoholics present a paradox in dynamics—the strong and largely unconscious wish to fail or relapse on the one hand, and the often desperate conscious desire to overcome the illness on the other. Freud has proposed the theory of the "death instinct," which may be one approach; Bergler emphasizes the role of super-ego tension and the driving compulsion for self-punishment. From studies concerned with the personality make-up of the alcoholic, a fairly characteristic pattern has evolved in which we see the alcoholic as a maladjusted and emotional immature individual. He frequently gives a history of an excessive dependence on his mother and strong mixed feelings in that relationship. He craves independence and earnestly desires to be free from that maternal bondage which so frustrates him, but he is utterly unable to break away from the pattern of the mother's domineering influence. This set of mixed feelings, the alternating love and hate for the mother, accounts for much of

---

This work was done in the Department of Psychiatry, University of Minnesota Hospitals, with the cooperation of the Department of Internal Medicine.

A part of this material appeared in the *Bulletin of the University of Minnesota Hospitals and Minnesota Medical Foundation* for Nov. 24, 1950.

the hidden frustration and the otherwise unrecognized mental and emotional conflict which characterizes these individuals.[18]

The alcoholic personality demands quick relief from his troubles. He is generally nervous, restless, and always craving something. He dislikes following a routine and does not want to be tied down to a day-by-day job. He longs to be a "big shot" but dislikes competition and is greatly influenced by his associates. He is markedly passive in nature—dictators are never alcoholics. Usually the alcoholic has a kind disposition and is cruel or sadistic only when extremely frustrated, but he does like to be humored and coddled. He often shows a serious lack of adequate goals in the reality of living. The alcoholic is not a good marital risk. He seems selfish in his love life, he is frequently sexually maladjusted, and because of his strong dependent personality trends it is difficult for him to assume responsibility and meet the obligations of adult behavior. The problem drinker is notorious for the intensity of his infantile needs and the demands he makes on those around him. The flight into alcoholic narcosis may represent an attempt to recapture the infantile feeling of omnipotence.[16]

Investigations of the early life histories of chronic alcoholics have suggested that many were more or less serious problems at "weaning time." The majority were not weaned until the second year, sometimes well into the second year. In babies we see that milk is in a way the baby's nervous or emotional anesthetic. That is, it does for the perturbed or nervously tense infant exactly what alcohol does for the frustrated and nervously tense adult.

In the individual history of an alcoholic it is difficult to say when socially and relatively harmless drinking was superseded by a more malignant and compulsive type of drinking. This is one of the insidious dangers of alcohol for unstable individuals.

Another aspect of this problem which must be kept in mind is the pharmacological factor. Nutritional deficiencies may be a cause as well as a result of chronic alcoholism. Neuro-endocrine disturbances are probably especially significant, and recent work suggests that many alcoholics are of generally asthenic habitus and deficient in gonadal and adrenocortical hormones.[19]

Of the numerous varieties of medical treatment offered to the chronic alcoholic in the past, none has given satisfactory results. Institutionalization has been tried frequently, sometimes for periods as long as a year, but this has not produced, with any frequency, the desired abstinence. Psychotherapy has not been too successful except in highly selected cases. From the point of view of treating large numbers of alcoholics, Alcoholics Anonymous has been the most effective tool yet devised. Here again there exists an absolute criterion for such therapy in that the Alcoholics Anonymous program means that the alcoholic has insight, that is, comes to Alcoholics Anonymous voluntarily with the admission that he is a drunkard. The aversion, or conditioned reflex, treatment based on Pavlov's work has had some success. First apomorphine, and recently emetine, has been the basic drug in this treatment, which consists of the patient being hospitalized and conditioned against alcohol by the simultaneous administration of one of these vomit-producing drugs and liquor. Using this treatment in carefully selected cases, Lemere[14] and others report 66 per cent successful abstinence for six months to two years after treatment and 46 per cent abstinence in cases followed four years or more.

In 1914, Koelsch reported that workers who handled cyanamide experienced flushing of the face, headache, accelerated and deepened respiration and pulse rate, and a feeling of giddiness on taking even a small amount of alcohol.[13] It has also been known for several years that the fungus *coprinus atramentarius,* though innocuous to man when taken alone, gives rise to similar unpleasant symptoms when alcohol is consumed.[3] In rare cases of idiosyncrasy to alcohol similar symptoms appear without any other drug being taken.

Antabuse (tetraethylthiurium disulfide) was discovered by Doctors Hald and Jacobsen in Denmark while they were working to develop a drug effective against certain intestinal worms.[7] As an incidental observation they noticed that a person taking this drug, upon ingesting alcohol in any form, always developed a group of symptoms which made drinking difficult. The drug by itself is nontoxic. The lethal dose in animals is reported to be 3 grams per kilo of body weight.[9] In clinical trials single doses of up to 6 grams and daily doses of 0.25 to 0.60 grams for several months were given without producing any subjective or objective symptoms apart from those following the ingestion of alcohol.

The clinical application of Antabuse in the treatment of alcohol addiction was first made by Jacobsen and Martensen-Larsen in Denmark. They found that when a person has taken Antabuse previously, the intake of alcohol results in the following chain of symptoms. After five to fifteen minutes the person has a feeling of heat in the face. A few minutes later an intense vasodilitation is observed in the face and neck, sometimes extending over the upper part of the chest and arms, making the whole area purple-red. Vasodilitation of the sclerae is also characteristic. The pulse rate is increased to 120 to 140. The blood pressure is unaltered or slightly depressed, and respiration is increased. Sometimes nausea begins thirty to sixty minutes after the ingestion of the alcohol. In such cases the intense flushing disappears and is replaced by facial pallor, and there is a considerable fall in systolic and diastolic blood pressure. Copious vomiting may occur. Large doses of alcohol may result in dizziness, occasionally unconsciousness and convulsions, and deaths have been reported. These symptoms are usually accompanied by an intense feeling of discomfort to the patient, who has a pulsating headache, palpitation, dyspnea, and extreme restlessness. Frequently the patient complains of a constricted feeling in the neck, "as though the collar were too tight," also a feeling of "premature hangover" which they find most disagreeable. Altogether, the discomfort is so intense that, once experienced, it discourages the large majority of patients from further attempts to use alcohol as long as they are taking the drug. These unpleasant effects usually last an hour or two, occasionally up to five hours, following which the person is quite fatigued and likely to sleep for a few hours. Then he awakens feeling fairly well.

Hypersensitivity to alcohol generally begins three to four hours after the ingestion of a single dose of Antabuse and is fully developed during the next twenty-four hours; on some clinical trials, however, this latent period was as long as forty-eight hours.

Antabuse is eliminated slowly in man, largely in the feces in unaltered form. Because of this slow elimination the effect of a single dose lasts up to eight days.

In prescribing Antabuse it is important to remember that alcohol in any form will start the usual chain of symptoms. Alcohol in such disguised forms as cough syrups and brandy sauces on puddings has produced symptoms; and even the liberal use of vinegar which had begun to ferment on a boiled cabbage, ham, and cole slaw dinner has, in at least one instance, made a person receiving Antabuse ill. Two cases have been reported where Antabuse patients have been noticeably uncomfortable after alcohol backrubs.[4]

Occasional mild effects are observed in patients receiving Antabuse. Most commonly complained of is lassitude and tiredness for the first few months. This may be handled adequately by giving the Antabuse in the evening when the sedative action is desirable. Mild allergic cutaneous reactions have been reported, as have dizziness, interference with taste, impotence, and mild gastrointestinal disturbances.[1] All of these symptoms respond to reduction in dosage. A possible explanation of these side effects is offered in a report by Edwards[2] that Antabuse alone partially inhibits cellular respiration.

The actual mechanism of the alcohol-Antabuse reaction is not yet known, but it is believed to be due to an increase in the acetaldehyde in the blood. This may be formed by some unknown reaction of the drug on the enzymes oxidizing alcohol in the organism.[8] Perhaps after treatment with Antabuse the normal elimination of alcohol is partly or completely blocked, and under the influence of the alcohol dehydrogenase a higher proportion of alcohol than normal is oxidized to acetaldehyde. Another possibility is that alcohol hydrogenase is highly activated by Antabuse. A significantly increased acetaldehyde concentration in the blood has repeatedly been demonstrated in persons treated with Antabuse who ingest alcohol.[7] Also the sequence of symptoms characteristic of the Antabuse-alcohol reaction can be duplicated by intravenous injection of acetaldehyde.

The contraindications to Antabuse therapy appear to be relative, and are usually psychiatric rather than organic. The original investigators treated all persons with alcoholism who consulted them, and they found no absolute contraindications.[10] However, the treatment is not without danger, and deaths have been reported.[5,12] Two deaths have been reported in Europe in patients treated with Antabuse who were suffering from diabetes mellitus, but other diabetics have been treated without complications.[17] Patients with cardiac damage present a greater risk, and extreme caution must be used in such cases. Bennett reports a case of mild heart disease with minimal electrocardiogram damage who had an electrocardiogram during an Antabuse test reaction which showed an alarming increase in coronary insufficiency.[1]

Asthma, nephritis, goiter, and epilepsy also indicate a cautious approach to Antabuse therapy. Moriarty[17] believes that the important psychiatric contraindications are drug addiction in the patient, as he would be likely to resort to more of the habituating drug when alcohol is removed as an escape; and the presence of psychosis, in which the patient might use Antabuse as a means of suicide or otherwise misuse the drug. A patient lacking insight, thus unable to accept the need of the treatment, would also be a poor candidate for Antabuse therapy.

Ten persons who have received treatment for alcoholism with Antabuse at University of Minnesota Hospitals in the past fourteen months are reported here. These patients volunteered for the treatment with the knowledge that this was its first use here and that it was still an experimental drug. Alcohol had constituted a problem for each of them for periods of from seven to thirty years. The criteria for selection were that the person be sincerely interested in receiving help, to the extent of agreeing to stay in the hospital for three weeks while treatment was begun; that they were of average intelligence, and that there were some positive factors in their previous personalities and work adjustments.

On admission to the hospital the procedure which was to be followed and the degree to which their co-operation was necessary was explained to them. Complete history and physical examination were done, as well as laboratory studies including electrocardiogram, urinalysis, complete blood count, serum bilirubin, thymol turbidity, cephalin cholesterol flocculation, and bromsulfalien retention at forty-five minutes after injecton of 5 mg. per kilogram of body weight. Continuous daily twenty-four-hour urine specimens for coproporphyrin determinations were collected throughout each patient's hospital stay; however, the porphrin results were inconclusive concerning the effect of the Antabuse-alcohol reaction on the urinary coproporphyrins. After a drying-out period of four or five days the patient was given an initial test of alcohol, usually 200 c.c. of 95 per cent ethyl alcohol in grape juice over a three-hour period, to obtain an idea of the individual's tolerance. Then approximately five days later, Antabuse was started, 1 gram the first day, and 0.5 grams daily thereafter as the maintenance dose. On the sixth day of Antabuse therapy the patient was given alcohol in order that he might have first-hand experience with the symptoms of the alcohol-Antabuse combination. An initial amount of 10 c.c. of 95 per cent ethyl alcohol was given orally. Pulse and blood pressure were checked at five minute intervals during the reaction. A second 10 c.c. quantity of alcohol was given approximately fifteen minutes later; and if the reaction was not then marked, a third 10 c.c. drink was offered to the patient, this about thirty minutes after the initial drink. This quantity was usually sufficient to demonstrate convincingly to the patient the severe symptoms which follow the ingestion of alcohol while taking Antabuse. The reaction which followed was the characteristic series of symptoms which was described earlier. In one of our female patients, 8 c.c. of 95 per cent alcohol was sufficient; in another case it was necessary to give 45 c.c. in order that the patient experience a reaction of the desired intensity. At the time of the test reaction it was impressed on the patient that such symptoms would follow the intake of alcohol as long as the patient continued taking Antabuse. He was also told that his sensitivity to alcohol would increase as he continued to take the drug and that any drinking would result in these symptoms and that heavy drinking might well endanger life. It was felt that some of the patients, most often those who had received the aversion treatment in the past, had some suspicion that the alcohol might have been tampered with, so they were encouraged to try a drink if they so desired, after leaving the hospital, but they were warned that if they did so, they should drink slowly and with extreme caution. At least two of our group did test themselves in this manner after leaving the hospital.

In two instances the initial Antabuse-alcohol test reaction was not severe enough so that the patients thought it would deter them from further drinking. The test was repeated in two or three days with 40 c.c. of 95 per cent alcohol given more rapidly, and both patients were then sufficiently impressed. It was interesting to observe in the two unsuccessful first trials here, and with a majority of the other patients in the group, that they expressed marked disappointment that they were not made even more ill when they took alcohol, almost as if they desired the drug to have a punishing quality.

Two of the patients in this group complained of mild gastrointestinal discomfort during the first week on Antabuse. In three other cases marked weakness, dizziness, tremor, incoordination, and restlessness were complained of during the first two or three weeks after leaving the hospital. There were no objective findings, however, and it was felt that these complaints most probably reflected the individuals' anxiety and apprehension about the loss of support that alcohol had previously offered them.

The Antabuse-alcohol reaction took place in all but one case without disturbing or unforeseen effects. In that case, a hypentensive patient complained of moderately severe anginal pain coincident with a blood pressure drop from 220/140 to 120/60 when alcohol was administered. No after-effects were observed, however.

After a satisfactory Antabuse reaction in the hospital, the patient was discharged and thereafter followed and supplied with more Antabuse in the Psychiatric Outpatient Clinic of University Hospitals. It was found desirable to reduce the daily dose of Antabuse to 0.125 grams in two cases and to 0.25 grams in another instance because of persisting uncomfortable side effects of dizziness and sleepiness.

Two of the subjects have been re-evaluated concerning liver function status three months after starting Antabuse and two others after six months on the drug. This data has been compared with the initial liver function tests, and no evidence of liver damage has been found.

All of these patients volunteered for Antabuse treatment, although in several of the cases pressure was brought to bear by the family or employer, and in each case the person had recognized before he or she came for treatment that alcohol constituted a severe problem for him and one in which he needed assistance. Individual psychotherapy was offered but not encouraged in order that the effectiveness of Antabuse alone might be better evaluated. The status and mechanism of Antabuse was discussed frankly with each patient during his hospitalization, and the theme was stressed that the effectiveness of the treatment depended on his continuing to take the drug regularly after leaving the hospital.

At this time two of the group are known to have discontinued the use of Antabuse. Significantly, perhaps, these two were receiving the most pressure from family or employers to undergo treatment. One was in the process of commitment to a state hospital for alcoholics. This was postponed when arrangements were made by his family for him to receive Antabuse, but commitment was subsequently carried through by his family when he was returned from another state in a chronic alcoholic condition five weeks after discharge from the hospital. The other failure was a nurse who was threatened with the loss of her job if she did not receive treatment, and she discontinued Antabuse a month after discharge from the hospital. Another patient stopped taking Antabuse and entered an alcoholic episode of a month's duration four months after leaving the hospital, but he subsequently returned voluntarily and has continued to do well on Antabuse since then. Still another of the group has discontinued the drug, but has not returned to drinking. The others have been getting along well and successfully staying away from alcohol for periods ranging from six to fourteen months.

It is apparent that the taking of the daily Antabuse dosage is voluntary and that, conversely, the patient can discontinue it at will. For this reason Antabuse therapy has no value in the patient who does not have insight into his alcoholic problem, thus who does not regard it as a real problem in his life, but who may be motivated to give lip-service to the treatment because of impending legal trouble, threat of divorce, et cetera. As an adjunct to therapy, however, it is our impression that Antabuse treatment has real value in the type of patient who recognizes that he is drinking abnormally but who does not seem able to stop drinking on a voluntary basis without outside help. In this patient, often the successful professional or business man or woman, Antabuse serves as a useful method of extending out into a three or four day future the earnest and sincere wish to stop drinking, coupled with the adequate recognition that if the drinking pattern is not interrupted, disaster or destruction of some type will follow. Several of the patients in this series have made the obvious remark that it is relatively easy to make the decision to take a pill on getting up in the morning when resolutions are high and then to relax in the knowledge that they cannot drink for at least three or four days. These patients tended to adopt the philosophy of thus keeping three or four days "ahead of the game."

Most patients made no attempt to avoid contact with liquor and attended social functions where cocktails and other drinks were served. One patient consistently maintained his usual late afternoon contacts with a hard-drinking group of friends of long standing who were accustomed to meet in a local bar. He felt that his friends were privately envious of his success at abstinence as judged by their frequent attempts at humor about his being "on the wagon."

It is recognized that one cannot draw valid conclusions after one year of follow-up in a series this small. However, it appears clear that as long as a person maintains his Antabuse dosage, it is a physiological impossibility for him to drink. In this regard it was our definite impression that the Antabuse-alcohol combination, as seen in the therapeutic trials in the hospital with small amounts of alcohol, contains a possible threat to life itself. If, for example, an Antabuse patient were to take rapidly a relatively large amount of alcohol (4 to 6 ounces of 100-proof whiskey), it seems likely that death might result from circulatory collapse unless the patient were immediately taken to a hospital and given active supportive therapy by a physician who was aware of the cause of the prostration. No patient should be given Antabuse without permitting him to experience a therapeutic trial with alcohol under hospital conditions. Only in this way can he adequately realize, intellectually and emotionally, how profound the reaction is. Toward the same end, each patient taking Antabuse should carry with him an identification card which states he is taking Antabuse, together with the name of the physician who is treating him. Antabuse patients should also be instructed about ingesting materials which they might not know contained alcohol, such as cough medicines, elixirs, et cetera.

Finally, it is important to keep in mind that a psychotherapeutic program which aims at permitting the patient to deal with underlying conflictual material should be an integral part of the total therapy of which Antabuse may be a valuable adjunct.

THE ASSASSINATION AND GUNSHOT WOUND OF PRESIDENT JAMES A. GARFIELD

OWEN W. PARKER, M.D.
Duluth, Minnesota

ON July 2, 1881, at 9.30 a.m., James Abram Garfield, twentieth President of the United States, while walking arm in arm with his Secretary of State, James G. Blaine, in the depot of the Baltimore & Potomac Railroad at Washington, D. C., was shot by Charles Guiteau.

It was another great shock to the Nation comparable to the assassination of President Lincoln. I recall the news of the event as distinctly as though it were yesterday. It reached out to our farm home on the wide sweeping mystic prairies of Iowa where "the lark calls, the wind sweeps, the prairie grasses quiver and sing a wistful roving song of hoof and wheel and sail"—not by radio or telegraph or train, but by the slow turning of loaded wagon wheels along the winding deep-rutted prairie trail of the time. Our neighbor had gone to town and brought back the news that President Garfield was shot. Young as I was, I sensed a tragedy to our country. My vivid impression of the event gave me an interest in Garfield which has always remained. I read all the news I could get of his long illness, his death and last rites with burial at Lakeview Cemetery in Cleveland, Ohio.

I read biographies of him and in later years visited his tomb and the spot where he fell in the old Baltimore & Potomac Railroad Station marked by a star on the floor. It is a remarkable fact that when the Nation gave expression to its sorrow over the death of Lincoln, Garfield should have been so notably the voice which spoke that sorrow—it was an emergency oration before an excited, sorrowful, turbulent and angry audience in New York City. The oration ended with those memorable words, "God Reigns and the Government at Washington Still Lives." He quieted the wild passions of the crowd, and it became strangely silent. Fate is ever unknown. Garfield, himself, became President and fell as did Lincoln by the hand of an assassin. "God Reigns and the Government at Washington Still Lives" was still true.

My first remembrance of a Presidential campaign was that of Garfield and Hancock in 1880. Both were generals in the War Between the States. James Abram Garfield had risen from the ranks and was a hero at Chickamauga, and Winfield Scott Hancock, the Superb, was a West Point graduate and a hero at Gettysburg. Both were popular and gallant and able men. The election went to Garfield by a fairly close margin and he became the twentieth President.

His nomination at Chicago was spectacular and dramatic. General Ulysses S. Grant had returned from a trip around the world and had received greater honors by the countries of the world than any living person of the time. He returned home a triumphant hero of the world. He was supported for a third term as President by the so-called stalwarts of the Republican Party, headed by that great orator, the imperious, powerful and indomitable Senator Roscoe Conkling of New York. Conkling was a handsome man of wonderful physique and courage—a massive, finely shaped head with hyperion curls. Blaine and Conkling did not get along well, and Blaine in a speech of ridicule spoke of Conkling as "He of the Turkey Gobbler Strut," which Conkling, it is said, never forgave.

When Conkling made his great speech nominating General Grant, it is said someone cried, "Where does he hail from?" Conkling replied in the famous words, "You ask me where he hails from? This shall my answer be—he hails from Appomatox and its famous Apple Tree." At the opening of the convention General Grant had the largest number of delegates but not enough for nomination.

The great James G. Blaine of Maine and Senator John Sherman of Ohio, brother of General William Tecumseh Sherman, and former Governor William Windom of our own State of Minnesota were also candidates. Garfield attended the convention as a delegate, supporting Senator John Sherman of Ohio, and made a great nominating speech for Sherman, which was wildly acclaimed and struck a strong note in the convention.

After long balloting with the Grant men

standing firm, but not gaining, the convention suddenly turned to Garfield and rapidly nominated him. It was a great personal triumph for Garfield.

Garfield's ancestors on his father's side came to Massachusetts in the early Colonial days and were of Welsh descent. His mother's ancestors were French Hugenots and also came in Colonial days to American shores. His father and mother settled in the Western Reserve near Cleveland. There Garfield was born in 1831.

In fighting a forest fire his father, a strong, powerful man, became exhausted and probably developed pneumonia and died, when Garfield was just a young boy. Left with his mother and brother and sister, he had to make his own way in the world. His mother lived to see him enter the White House as President.

They were greatly devoted to each other. Garfield worked hard as a boy. At one time he was employed on the Canal. He graduated from Williams College, Williamstown, Massachusetts, taught school, at times preached sermons in the churches. He entered the war between the states, was rapidly promoted, becoming a general. He was elected to Congress during the war—an office he held for many years—and then was elected to the United States Senate from Ohio, just before his nomination for the President of the United States.

There was much bitterness, fighting and feuding in his party during his first few months of the Presidency, which had caused him much worry and difficulty, and to add to his troubles, Mrs. Garfield became sick with typhoid fever just after they entered the White House. She was recovering at Long Beach at the oceanside in New Jersey.

It was the purpose of the President, as soon as the pressing cares and anxieties of his great office could be put aside, to join his wife by the seaside and to enjoy with her a brief respite from the burdens and distractions which weighed him down, so with the coming of July first and the adjournment of Congress, he proposed to rest with his family for a brief season by the sea, after which he would visit Williams College to make arrangements for the admission of his two sons to his alma mater.

On the morning of July 2, 1881, he proceeded to carry out his plans. Several members of the Cabinet, headed by the Secretary of State, Mr. Blaine, were to accompany him to Long Beach. A few ladies, personal friends of the President's family, were in the company, and as the hour of departure drew near, they gathered at the depot of the Baltimore & Potomac Railroad to await the train. The President and Secretary Blaine were somewhat later than the rest. On the way to the depot the President, always buoyant and hopeful, was more than usually joyous and grateful that the relations between himself and the members of the Cabinet were so harmonious, and that the Administration was a unit. Amongst his Cabinet, besides Secretary Blaine, were Robert Todd Lincoln, son of President Abraham Lincoln, Samuel Kirkwood, war governor of Iowa, and our own former governor of Minnesota, William Windom.

When the carriage arrived at the station at 9:30 a.m., the President and Mr. Blaine entered the Ladies' Waiting Room, which they passed through arm in arm as mentioned above. A moment afterwards, as they were passing through the door into the main room, two pistol shots were heard. Mr. Blaine saw a man running and started toward him, but turned almost immediately and saw that the President had fallen. He had received a pistol shot wound from a British Bulldog revolver, which carried a 44/100 central fire cartridge, powder 20 grains, weight of bullet 200 grains. He was fired upon at a distance of eight feet from behind. Dr. Townsend, Health Officer of the District, who was the first doctor to come to the scene, is reported to have said, "I found the President, when I arrived at the Baltimore & Potomac depot, about five minutes after the shooting occurred, in a vomiting and fainting condition. From the pulse at the wrist I thought he was dying. I had the head lowered and administered aromatic spirits of ammonia and brandy to revive him. This had the desired effect and the President regained consciousness—was asked where he felt the most pain, to which he replied, 'In the right leg and foot.' I asked him the character of his pains and he said it was a prickling sensation. He rallied considerably and I proceeded to examine his wounds. I found that the bullet had entered his back two and one-half inches to the right of the vertebrae. I introduced my finger into the bullet wound. Some hemorrhage followed. After examination of the wound the President looked up and asked me what I thought of it. I answered I did not consider it serious.

He continued, 'I thank you, Doctor, but I'm a dead man.' "

Dr. W. W. Bliss, surgeon in charge of President Garfield throughout his illness, wrote a complete history of the President's case immediately following his death. Excerpts from this detailed history are here presented:

> The great interest which has been manifested by the medical public in the surgical history of the case of President Garfield, and my close and direct connection with it as surgeon in charge, from the time I was summoned until his death, imposes upon me the obligation of giving, even at this early date, a general summary of the salient points connected with its diagnosis, treatment, and pathology.
>
> Immediately after the shooting of President Garfield, on the morning of July 2, I was summoned by the Secretary of War to take charge of the case. I was conducted to an upper room in the building, where I found the President lying upon a mattress, in a semiprone position, on the left side. He presented the appearance of perfect collapse, the lines of expression were lost, there was extreme pallor, sighing respiration (about eight or ten per minute); pulse exceedingly small, feeble, and frequent, and ranging about 120. Large beads of perspiration stood upon his hands and forearms.
>
> The President complained of a sense of weight and numbness, and subsequently of a tingling sensation and pain in the lower extremities. With a view of exploring the wound to ascertain the course of the ball and the organs involved in its passage, I introduced a Nelaton probe which took a direction downward and forward, on a line which would represent a point of exit four inches to the right, and nearly directly opposite to the umbilicus. The point of entrance of the ball, which was oval and sharply cut, was on the right side, four inches from the median line of the spine, and on a line with the eleventh rib. A slight discharge of blood was oozing from this orifice, and had soiled the clothing. I passed the probe in the direction previously indicated, through the tenth intercostal space, for a distance of three and one-half inches from the surface of the body, to what appeared to be a cavity, and I was unable to detect any foreign substance beyond the rib to indicate the presence of fragments of bone or the missile. In attempting to withdraw the probe it became engaged between the fractured fragments and the end of the rib, and could not be liberated until pressure was made upon the sternal end of the rib so as to slightly elevate its fractured extremity.
>
> I then passed the little finger of my left hand to its full extent into the wound, which developed the character and extent of the fracture of the rib, and was only able to reach a point on a line with the inner surface of the rib, where it came in contact with what appeared to be lacerated tissue or comparatively firm coagula, probably the latter. After withdrawing my finger I made an exploration with a long, flexible silver probe, which I suitably curved before entering, and gently passed it downward and forward, and downward and backward in several directions, with a view of indicating the course of the ball, if it had been deflected by contact with the rib, and meeting with resistance from soft parts. I desisted and excluded the probability of deflection, being inclined to the opinion that the ball had entered the liver, which, if true, would not warrant further exploration in that direction.
>
> The President repeatedly requested that he be taken to the White House, and after further consultation and a full understanding of the manner and detail of his transfer, his speedy removal was agreed upon.
>
> On his arrival at the White House by ambulance, a careful examination was made of his condition. The pulse continued feeble, frequent, and extremely compressible; the respiration was slow and sighing; extremities and surface cold, with occasional vomiting and profuse perspiration over the entire body; voice husky, with constant complaint of severe pains in the inferior extremities. He was placed upon his right side, so as to make the wound dependent, to facilitate drainage, and keep the viscera in contact with the injured parietes, with a view of preventing further hemorrhage and looking to the possible adhesion of the injured parts to the peritoneum. Water was given in small quantities, often repeated. This was necessitated by the extreme thirst from which the patient suffered.
>
> A hypodermic injection of one-eighth of a grain of morphine and one-eightieth grain of atropia was administered to control the pain in the extremities, and as a more permanent stimulant to assist reaction. This was about 10 a.m., July 2.
>
> There was but little change in the condition of the patient, either in temperature, respiration, or pulse, until about eleven o'clock, when it was determined to repeat the morphine in the dose of one-sixth of a grain, the atropia being omitted. This soon had the effect of modifying the pain and discomfort, and the respiration became more frequent and easy. The pulse responded but little to the stimulants. Nausea and vomiting continued at intervals of thirty minutes during the entire day and until 7 p.m., when it became less frequent, with less retching—in fact, being simply a regurgitation of the fluids of the stomach. This condition continued at longer intervals until six o'clock the following morning.
>
> At 10 p.m. the pulse was 158, temperature 96.5, respiration 35, which was the most critical period attending the collapse. At 11:20 p.m. the evidences of reaction began to manifest themselves.
>
> When the pulse had diminished to 120, the temperature had risen to 98 degrees F., and the respiration was 18.
>
> The patient slept at short intervals, generally arousing with an effort at regurgitation of the contents of the stomach, but otherwise expressed a feeling of comfort and gave evidences of rest. During the night he seemed to be refreshed and was comparatively free from pain. There was no time after my first visit, up to this

period, that the patient was not perfectly rational, and often made brief, persistent inquiries as to the character of the wound and his condition.

At the evening consultation, July 2 (7 p.m.), the opinion was expressed by some of the medical gentlemen invited to the case, that internal hemorrhage had taken place, and that he would not survive the night, and expressed these views to the council. The symptoms of profound collapse were so grave that Surgeon-General Wales was induced to express the opinion that the President was dying.

All the physicians visited the White House at 8 a.m., July 3, for the morning consultation, agreeably to a previous understanding that such should be the case if the President survived the night. At this consultation, Surgeon-General Barnes and Surgeon Woodward, U.S.A., Dr. Reyburn and Dr. N. S. Lincoln visited the bedside of the patient with me, with a view of making the necessary examinations, dressing the wound, and of reporting results to the other members of the council. The patient was found with a pulse of 115; the temperature was nearly normal, as was the respiration. He was cheerful, gave evidence of being rested, and made definite inquiries regarding his condition and prospects. The use of morphine hypodermically, in doses of sufficient quantities to control the pain in the extremities, was advised, and it was agreed that the patient should continue to occupy the position on his right side as before directed, so far as was possible; and that the wound should be exposed only when the dressings became disarranged; and that their character should not be changed.

The primary reaction reached its highest point of temperature, pulse, and respiration, at 2 p.m. on Sunday, July 3. Slight tympanites was detected, but no pain on pressure, or any marked rigidity of the abdominal walls. These were the only symptoms which pointed to the existence of peritonitis throughout the whole course of the case, and the spontaneous movement of the bowels, already noted, was an additional evidence that the peritoneum was not involved.

At 10:45 p.m. the pulse had gradually increased in frequency until it reached 120. The temperature remained at 100 degrees, and respiration at 20. At this time Dr. D. Hayes Agnew of Philadelphia and Dr. Frank H. Hamilton of New York were summoned to visit the patient in consultation. Dr. Agnew arrived about four o'clock the following morning, July 4, and Dr. Hamilton at 6 a.m. They were presented to the President formally at the consultation, 8:15 a.m., at which time the pulse was 104, temperature 99.4 degrees, and respiration 19. He had passed a comparatively comfortable night, awakening every twenty or thirty minutes, taking water or liquid nourishment in small quantities each time and dropping quickly to rest. The nausea had quite subsided, and the pain and soreness of the lower extremities was measurably controlled by the administration of morphia, which was continued in quarter-grain doses each evening, administered hypodermically.

A careful review of the case from the time I first saw the President was given to these gentlemen, with the request that they, with the data before them, examine the case thoroughly, as though it were their own, and freely express their views of the character and gravity of the injury and the course of treatment of the case up to that time. I also gave them a detailed account of the explorations made in the wound and the unsettled convictions as then held as to the course of the missile and the organs involved in the injury. They individually examined the wound with great care. These examinations consisted in the introduction, in different directions, of probes, flexible bougies, in order, if possible, to determine the course of the ball. With the evidences developed by this personal examination, together with the complete history of the shooting of the President, and the progress of the symptoms for the first forty-seven hours, they proceeded to discuss the possible course of the ball and organs involved, viz., whether it passed directly forward into or through the liver, or was deflected backward at a right angle so as to involve the spinal column, or downward behind the peritoneum toward the pelvic cavity. Carefully weighing all the evidences, the more prominent symptoms upon which the diagnosis was based are presented in the following manner: the relative position of the assassin to the President at the time of shooting, the direction of the ball through the tissues, so far as safe exploration could determine, gradual subsidence or modification of pain and hyperaesthesia of the feet; the repeated unsuccessful efforts to pass a probe or flexible instrument more than one-half inch in any direction, beyond the fractured rib, except in a direction downward, a little forward and anterior to the twelfth rib, a distance of about two inches. The fact also was considered that explorations had twice been made with the finger—one by myself soon after I reached the injured President, and subsequently by Surgeon-General Wales of the Navy, on the occasion of the consultation on the evening of July 2; and in each instance it was found impossible to successfully explore by that means beyond the inner border of the fractured rib so as to determine, with accuracy, the course of the ball, or even the condition of the tissues indicated by the end of the finger. Nor did they underestimate the significance of the profound shock, nor the unusual period of collapse which followed and seemed to point to extensive lesion of important viscera. However, that the kidneys, intestine, and peritoneum were not immediately involved, was made patent by the unrestrained passage of normal urine at proper intervals, the spontaneous movement from the bowels of natural faeces, the frequent discharge of flatus, and the absence of other symptoms of peritonitis. With all these facts before them it was impossible to determine positively the course taken by the ball. The indications pointed to a downward course of the ball, into the pelvic cavity. Upon careful consideration of the foregoing facts, and of the opinions expressed by the distinguished counsel, we were inclined to recede from the opinion at first adopted regarding the supposed passage of the ball through the liver. The propriety of making extensive incisions and dissections so as to explore the fractured ribs and remove as much as might be necessary to reveal the true course of the ball, was duly considered. But the opinion was maintained that favorable progress of the President thus far did not warrant any interference, and, further, such an operation would seriously complicate the case and diminish the prospects of recovery. The facts revealed by the autopsy cofirms the wisdom of the course pursued. With this in view all the surgeons concurred.

The case progressed, with slight fluctuations, up to July 23, when a rigor occurred at 7 p.m. followed by a pulse of 124, respiration 26, and temperature 104 degrees F. Two days previous to this a pus-sac was observed in the common integument extending down below the twelfth rib toward the erector spinae muscle, and underneath the latissimus dorsi and was carefully evacuated by gentle pressure into the original opening on the occasion of each dressing. We did not feel satisfied that this superficial and limited collection of pus, which was so readily evacuated, was the principal cause of the aggravation of the symptoms present. However, a free incision was made into the pus sac, which afforded a more direct and dependent channel to the fractured rib, from which a small fragment of bone was removed.

After the operation the improvement was not as prompt as we had reason to expect, and on the 26th of July the opening between the fractured ends of the eleventh rib was enlarged, and a small detached portion was removed. This facilitated the discharge of pus, and, as a result, a more uniform condition of the symptoms was maintained until about August 6, when slight febrile exacerbations were observed, which continued to be manifest until the operation was made to afford a more free passage of pus from the supposed track of the ball. The necessity of the operation was more plainly developed by passing a flexible catheter through the opening previously made, which readily coursed toward the crest of the ilium, a distance of about seven inches. This cavity was evacuated twice daily, by passing through the catheter, previously inserted in the track, an aqueous solution of permanganate of potash from a small hand-fountain, slightly elevated, the water and pus returning and escaping at the opening externally. The indications for making a point of exit in the dependent portion of the pus-sac were urgent, and on August 8 the operation was performed by extending the incision previously made, downward and forward through the skin, subcutaneous fascia, external and internal oblique muscles, to a sinus or pus-channel. The exposed muscles, to a sinus or pus-channel, contained a considerable number of minute spiculae of bone. Upon carrying a long, curved director through the opening between the fractured rib downward to the point of incision, there was a deeper channel which had not been exposed by the operation thus far, and the incision was carried through the transversalis muscle and transversalis fascia, opening into the deeper track and exposing the end of the director. A catheter was then passed into the portion of the track below the incision, a distance of three and one-half inches, and in a direction near the anterior superior spinous process of the ilium. The President was etherized during this operation.

On August 18 a slight tumefaction of the right parotid gland was noticeable, unaccompanied by pain or tenderness on pressure, until the suppurative period was established, when mental disturbance, vomiting, restlessness, and jactitation supervened; nor was there any increase of temperature, local or systemic, to indicate the probability of its metastatic origin. The parotitis presented many of the characteristics of an ordinary carbuncle, and was unaccompanied by any other abscesses in the adjoining tissue. During the progress of the parotitis facial paralysis occurred, and continued with slight improvement, until the time of his death. When the climax of suppuration was reached, a free discharge of laudable pus followed, with a rapid abatement of the more urgent symptoms, and after the separation of the slough (which was limited in extent) reparation was rapid and complete throughout the entire suppurating surface, as well as in the several incisions which had been previously made to liberate the pus.

The subject of the removal of the President to a more salubrious locality had been discussed for several days, and was urgently presented at the consultation on August 25. The majority of the council, with myself, considered that his removal at this time would be attended with very great hazard. The hope, however, was expressed that the President might be sustained until suppuration was established in the parotid, and the constitutional disturbances incident thereto had subsided, when it would be possible to remove him.

Finally, it was decided by the majority of the surgeons that the President should be removed to the seashore.

His transfer from the Executive Mansion to the cars was made with the least possible disturbance, without accident, and with perfect satisfaction and comfort to the patient. During the journey his pulse and temperature were taken from time to time, and frequent examinations made to determine the effect of the motion at different rates of speed. The minimum of unpleasant motion seemed to be secured at a rate of about sixty miles an hour. During the last hour of his journey he showed symptoms of fatigue, which would have prevented a longer journey, had such been required to reach his destination. His pulse increased, the countenance became slightly anxious, and the temperature measurably exalted at the period to which I allude.

He was transferred from the cars to the Elberon cottage at 10 p.m. without accident. His pulse at 10 p.m. reached 124, temperature 101.6 degrees. The morning of September 7 his pulse had fallen to 106, temperature 98.4 degrees, respiration 18. The President expressed great satisfaction that he had arrived at the seashore, and notwithstanding the heat of the two succeeding days, it made but little impression upon the distinguished patient, the pulse, temperature, and respiration continuing the same until September 15, when his pulse slightly increased in the evening, so that it occasionally reached 120 during the night.

After his arrival at Elberon there was an extension of the bronchial catarrh into the ramifications of the bronchi of the right lung, and limited broncho-pneumonia followed.

I should mention here a fact well known, that the President was so much pleased with his improvement, that he expressed that the number of his professional attendants should be reduced. Accordingly, Drs. Barnes, Woodward and Reyburn retired from the case, leaving Elberon the morning of September 8.

September 17, at 11:00 a.m. a severe rigor occurred of half an hour's duration, followed by a sharp rise of temperature. At 12 a.m. the pulse was 120, temperature 102 F., and respiration 24. The mental disturbances were more noticeable during the febrile rise, but the stomach was able to retain the nourishment and stimulants, which were given at regular intervals in the form of milk punch. This chill was accompanied by severe pain over the anterior mediastinum, and the President said to me that it was similar to what he understood as angina pectoris. It is evident that this pain, which occurred on several occasions at intervals of six to twelve hours prior to his death, was occasioned by first, a rupture of the aneurismal sac, and the progressive dissection, at irregular intervals, of the blood into the surrounding tissue, until finally it burst into the peritoneum.

A febrile rise was very marked by twelve noon of the 17th, attended with great anxiety of countenance, the temperature falling to 98 degrees F., the lowest point of normal range, the pulse being, however, steadily at 102, and rather feeble. While there was, in my judgment, an absence of typical metastatic abscesses to produce this symptom, there was a profound expression of gravity in his condition that was not commensurate with the systematic disturbance, and which prevented my absence even for a few moments at a time. I made the remark to Dr. Agnew: "I am in constant fear of some danger impending. We may have a terrible outburst, possibly in the shape of a cardiac thrombus," I said to members of the family: "There is a gravity in this case that portends serious trouble."

At 6:00 p.m. of the 18th there was another chill, accompanied with pain as before. The febrile rise continued until midnight, the pulse varying from 112 to 130.

At 8:00 a.m., September 19, the pulse was 106 and feeble; temperature 108.8, and all the conditions unfavorable. In half an hour afterward there was still another chill, followed by febrile rise and sweating, and also with pain as before. During the periods of chill and fever he was more or less unconscious. He passed all day in comparative comfort, and at 8:30 in the evening his pulse was 108, respiration 20 and temperature evidently a little lower than normal.

At 10:10 p.m. I was summoned hastily to the bedside, and found the President in an unconscious and dying condition, pulseless at the wrist, with extreme pallor, the eyes opened and turned upward, and respiration eight per minuate, and gasping. Placing my finger upon the carotid, I could not recognize pulsation; applying my ear over the heart, I detected an indistinct flutter, which continued until 10:35, when he expired. The brave and heroic sufferer, the nation's patient, for whom all had labored so cheerfully and unceasingly, had passed away.

Autopsy revealed the track of the ball presenting a course of entrance downward and forward to the point of impingement upon the eleventh rib, and being then deflected to the left at almost a right angle, passing behind the kidney, perforating the intervertebral cartilage and first lumbar vertebrae anterior and to the left of the kidney, and finding its lodgment below left extremity of the pancreas, wounding in its track the splenic artery.

A mass of black, coagulated blood covered and concealed the spleen and the left margin of the greater omentum. On raising the omentum it was found that this blood-mass extended through the left lumbar and iliac regions and dipped down into the pelvis, in which there was some clotted blood and rather more than a pint of bloody fluid.

The blood coagula having been turned out and collected, measured very nearly a pint. It was now evident that secondary hemorrhage had been the immediate cause of death, but the point from which the blood had escaped was not at once apparent.

The adhesions between the liver and the transverse colon proved to bound an abscess-cavity between the under-surface of the liver, the transverse colon, and the transverse mesocolon, which involved the gall bladder, and extended to about the same distance on each side of it, measuring six inches transversely and four inches from before backward. This abscess did not involve any portion of the substance of the liver except the surface with which it was in contact, and no communication could be detected between it and any part of the wound.

The liver was larger than normal, weighing eighty-four ounces; its substance was firm, but of a pale yellowish color on its surface and throughout the interior of the organ, from fatty degeneration. No evidence that it had been penetrated by the bullet could be found, nor were there any abscesses or infarctions in any part of its tissue.

The spleen was connected to the diaphragm by firm, probably old, peritoneal adhesions. There were several rather deep congenital fissures in its margins, giving it a lobulated appearance. It was abnormally large, weighing eighteen ounces; of a very dark lake-red color both on the surface and on section. Its parenchyma was soft and flabby, but contained no abscesses or infarctions.

Behind the right kidney, after the removal of that organ from the body, the dilated track of the bullet was dissected into. It was found that from the point at which it had fractured the right eleventh rib (three and one-half inches to the right of the vertebral spines) the missile had gone to the left, obliquely forward, passing through the body of the first lumbar vertebra and lodging in the adipose connective tissue immediately below the lower border of the pancreas, about two and one-half inches to the left of the spinal column, and behind the peritoneum. It had become completely encysted.

The track of the bullet between the point at which it had fractured the eleventh rib and that at which it entered the first lumbar vertebra was considerably dilated, and the pus had burrowed downward through the adipose tissue behind the right kidney, and thence had found its way between the peritoneum and the right iliac fascia, making a descending channel which extended almost to the groin. The adipose tissue behind the kidney in the vicinity of this descending channel was much thickened, and condensed by inflammation. In the channel, which was found almost free from pus, lay the flexible catheter introduced into the wound at the commencement of the autopsy; its extremity was found doubled upon itself, immediately beneath the peritoneum, reposing upon the iliac fascia, where the channel was dilated into a pouch of considerable size. This long descending channel, now clearly seen to have been caused by the burrowing of pus from the wound, was supposed during life to have been the track of the bullet.

On the examination and the dissection made, it was found that the fatal hemorrhage proceeded from a rent, nearly four-tenths of an inch long, in the main trunk of the splenic artery, two and one-half inches to the left of the coeliac axis. This rent must have occurred at least several days before death, since the everted edges in the slit in the vessel were united by firm adhesions to the surrounding connective tissue.

The surgeons assisting at the autopsy were unanimously of the opinion that, on reviewing the history of the case in connection with the autopsy, it is quite evident that the different suppurating surfaces, and especially the fractured spongy tissue of the vertebra, furnish a sufficient explanation of the septic conditions which existed during life.

The autopsy report was signed by Drs. D. W. Bliss, J. K. Barnes, J. J. Woodward, Robert Reyburn and D. S. Lamb. The names of Drs. F. H. Hamilton, D. Hayes Agnew, and A. H. Smith, were not appended to it. It was, however, submitted to them, and they gave their assent to the other portions of the report.

The body of President Garfield was taken back to the Capitol where it lay in state in the rotunda for two days and then was taken to Cleveland, Ohio, for burial in the Lakeview Cemetery. Among the great numbers in attendance at the cemetery was Major William McKinley, who later became President McKinley, and who, himself as President, met a similar fate at the hands of an assassin.

The assassin, Charles Guiteau, was captured before he could escape from the scene and placed in jail. Following Garfield's death, he was tried by the court in Washington, D. C., and found guilty, and later executed by hanging.

Many prominent alienists, or psychiatrists, were called at that time to testify as there seems to have been some question as to whether or not Guiteau had a mental illness. He was a strange, ne'er-do-well, fanatical sort of character, fairly well educated, had practiced law, I believe in Chicago, and engaged in various other occupations, even the ministry. He had conceived the idea of being made a consul to France, and had been in Washington for some time, amongst the hoard of office seekers, and, having been disappointed, followed the President at various times, even to church, with intent to assassinate him.

The late Dr. Alan McLane Hamilton, alienist of New York City, and distantly related to Alexander Hamilton, was at the trial of Charles Guiteau and gave an excellent description of it in his book.

The doctors who cared for President Garfield, one feels, in reading the history, were men of character and high standing, and great professional ability. Dr. Hayes Agnew was, perhaps, the most outstanding of the group. He was a great surgeon of the Listerian period, and was professor of surgery at the University of Pennsylvania.

Dr. Frank Hamilton was a great orthopedic and plastic surgeon of New York City.

When I first started treating fractures on the Iron Range of Northern Minnesota, we sometimes used the Hamilton splint.

We must recall that their difficulties in treating the gunshot wound of President Garfield were much greater than ours would be at the present day. It was before the days of aseptic surgery, antiseptic or Listerian surgery was practiced. There was no x-ray to assist in diagnosis. There was no penicillin nor sulfa drugs, no antibiotics, no antitoxins, blood transfusions nor intravenous solutions. Today, we would likely not probe for a bullet or even insert the finger for examination. No sterile surgical gloves were in use until Professor Halsted of Johns Hopkins used them in the early Nineties.

In 1900, when I interned at St. Luke's Hospital, Saint Paul, Minnesota, rubber gloves were in constant use by Drs. Wheaton and McLaren, and all the younger surgeons, John T. Rogers, Warren Dennis, Judd Goodrich, Harry Ritchie, Arthur Gillette, Knox Bacon, Alexander Colvin, and other younger men who operated at St. Luke's hospital. Yet there were excellent older surgeons over the country who did not use gloves, and operated bare-handed, with arms exposed to the elbows, for a number of years after 1900.

It would seem that one must conclude that sepsis entered largely into the cause of the death of President Garfield, even though a sudden hemorrhage seemed the immediate cause.

SPONTANEOUS PNEUMOTHORAX COMPLICATING BRONCHIAL ASTHMA DUE TO WOOD DUST

J. S. BLUMENTHAL, M.D., F.A.C.P.
Minneapolis, Minnesota

IN spite of the increased intra-alveolar pressure present in asthma, an associated spontaneous pneumothorax has been infrequently reported. This is the more remarkable because this entity is not an uncommon event in apparently normal chests, even with the individual at rest. Thus Crenshaw[4] reports on eighty-six patients between the ages of a few hours and seventy-two years in whom spontaneous pneumothorax occurred in the absence of tuberculosis or trauma, while severe exertion was a contributing factor in only a few. This rarity of reported spontaneous pneumothorax in asthma may be because the increased pressure in asthma comes in inspiration in alveoli that have become gradually dilated. It may also be because the diagnosis is missed because of the difficulty in detecting the new physical findings and symptoms in the presence of already marked asthmatic and emphysematous signs, even though the breathing may be further embarrassed. Persistent nonexpansion of the lung is quite rare. Crenshaw[4] reports ten of eighty-six cases with persistent spontaneous pneumothorax due to labor and segmental localized emphysema with formation of bullae and blebs. At any rate, pneumothorax is frequently found at autopsy in asthmatics[7] even though it may be unsuspected clinically. The cause of pneumothorax is probably the rupture of blebs and bullae due to increased size because of tension or because of interference with the blood supply to the bleb.

Spivacke[14] reported a case of asthma with pneumothorax in an eleven-year-old child, though other pathological factors may have been involved. Faulkner and Wagner[6] report a case of fatal spontaneous pneumothorax and subcutaneous emphysema in an asthmatic. Jeffrey and Marlott[8] report on a bilateral pneumothorax in a seventeen-year-old asthmatic. Perhaps because of greater ease in diagnosis, subcutaneous emphysema associated with or without pneumothorax is more frequently noted.[2,5,11,13] The underlying cause is essentially the same except that, of course, the lung vesicles rupture under thhe visceral pleura.

The treatment of simple and single spontaneous pneumothorax is usually conservative but exploratory thoracotomy in persistent types may be indicated.

Wood[1,3,9,10,12,15] has been known to cause allergic manifestations. Kejaat, boxwood, orangewood, pine, spruces, cedar are among the woods involved, though at times the many smuts and fungi are very difficult to rule out. Skin tests may or may not be positive though clinical tests are. Treatment by desensitization is usually successful, but avoidance of the allergen is, of course, usually the method of choice.

Case Report

A carpenter, aged forty-three, was admitted to the University Hospital with symptoms of five days' duration. He had a cough, shortness of breath, pain of sudden onset in the right chest and a "sloppy" sensation in the right chest. The cough and shortness of breath had also suddenly become much more severe five days ago. There is no history of any unusual exertion, but he had had a cough with asthmatic breathing for the last nine months which was initiated and aggravated at his place of employment. His symptoms were only present after being exposed to the dust at his place of work. This dust consisted of oak, mahogany and cedar woods. No previous history of asthma could be elicited. His past and family history are not contributory.

Physical examination was negative except for chest findings. There was a flatness of the right intercostal spaces; the right supraclavicular fossa was shallow. There were decreased breath sounds and fremitus in the same area. The trachea was shifted to the left. X-ray revealed a massive pneumothorax of the right chest. The cardiac and tracheal shadow was shifted to the left indicating a tension pneumothorax. The right dome of the diaphragm was depressed. Respirations were 26, pulse 78, blood pressure 110/70, temperature 98. The eosinophile count was 15 per cent though the count had been normal on several previous occasions. Other findings were not remarkable. Intradermal skin tests were for the most part negative but the mixture of cedar, mahogany and oak dust from his place of work produced

---

From the Department of Internal Medicine, Allergy Clinic, University of Minnesota.

a positive scratch test. While an atomizer inhalation of house dust was productive of no clinical symptoms, when wood dust was used the patient had definite signs of respiratory embarrassment. Because of the odor of the cedar, it was difficult to disguise the material used. Extensive questioning did not reveal any antipathy to his work, employers or surroundings. It would be difficult to escape the conclusion that the wood dust was the antigen causing the asthma. The factor of the spontaneous pneumothorax is very difficult to assess.

The patient was treated conservatively except that the air in the pneumothorax was aspirated twice in the first twenty-four hours. He made an uneventful recovery and at the last visit had no symptoms. He was advised to refrain from exposure to the antigen as the most practical form of treatment though desensitization could be considered.

Summary

A case is reported of spontaneous pneumothorax in a man suffering from asthma probably caused by wood dust.

THE FUTURE OF THE VETERANS ADMINISTRATION MEDICAL PROGRAM

(Continued from Page 220)

happy to serve, often at considerable personal sacrifice, as advisers and consultants. The medical and nursing staffs of Veterans Administration hospitals were brought to a par with the best civilian institutions, equipment was improved, opportunities for research were created and the veteran was provided with "medical care second to none."

All this was not accomplished without a struggle. As Dr. Carroll points out, there is much that has been criticized. No system is without fault, and the inherent defect in the Department of Medicine and Surgery in the Veterans Administration is that it is subject to the restrictions, regulations and budgetary limitations that affect the entire Veterans Administration Program. Consequently, its personnel, its supplies and equipment and even its planning may be impaired by measures directed primarily toward abuses in other departments of the Veterans Administration. This defect was recognized at the outset by General Hawley. Complete rapport between him and General Omar Bradley minimized the problem, but with the departure of these men to other fields, the difficulties have slowly multiplied. Without warning, extensive reductions in personnel have been ordered, with results often deleterious to the care of patients; personnel ceilings have been established when certain hospitals were already seriously shorthanded thus permanently crippling their staffs; minimal expenditures that would permit the development of research programs have been forbidden, while millions of dollars were being spent to erect hospitals where they were not badly needed.

Recognizing these defects, Dr. Magnuson has vigorously championed the cause of a more independently administered medical program. Under his leadership, substantial progress has been made in effecting affiliations between medical schools and the Veterans Administration hospitals. He has attracted the highest type of medical personnel to the Veterans Administration, and under him the best and most modern treatment of the incapacitated veteran has been assured. His insistence that the administration of hospitals and clinics should be under the direct control of the chief medical director has received the complete and unwavering support of his board of national consultants. Any deviation from his policies undoubtedly will bring about a deterioration in the medical program of the Veterans Administration. His loss is a grievous one; his successor assumes a momentous responsibility for the future of the program.

Fortunately, the appointment of Vice Admiral Joel T. Boone as chief medical director indicates that there will be no change in policy and no acceptance of lower standards. Admiral Boone, a holder of the Distinguished Service Cross and the Congressional Medal of Honor, a naval officer of distinction and a man of the highest personal integrity, is well equipped to maintain the high ideals and high standards of medical care originally envisaged by Generals Bradley and Hawley. In his efforts he will have the wholehearted support not only of his colleagues within the Veterans Administration but of the entire medical profession.

The ultimate future of the Department of Medicine and Surgery in the Veterans Administration, however, depends upon whether or not it is granted the autonomy it needs to manage its hospitals and clinics in accordance with the best medical traditions.—*Editorial, New England Journal of Medicine,* Feb. 8, 1951.

History of Medicine In Minnesota

MEDICINE AND ITS PRACTITIONERS IN OLMSTED COUNTY PRIOR TO 1900

NORA H. GUTHREY
Rochester, Minnesota

(Continued from the February issue.)

On November 20, 1884, William J. Mayo was married to Hattie May Damon, of Rochester, the daughter of Eleazer Damon and Carolyn M. Damon. Mr. and Mrs. Damon were both of English descent and natives of Massachusetts who came to Rochester in 1856. Mr. Damon was the pioneer jeweler of the city; his first store was a small log building on what is now First Avenue, S. W.; the path that led westerly from the store to his home became Zumbro Street. He was a good citizen who furthered all measures for the welfare of city and county; the family were sustaining members of the Congregational Church. With the marriage of William J. Mayo and Hattie M. Damon there began a perfect companionship, in an always gracious home, that was to continue fifty-five years. Those who have enjoyed the hospitality of Dr. and Mrs. Mayo in their home or on their boat on the Mississippi River know well the restful order and friendly atmosphere that surrounded them. Five children were born to Dr. and Mrs. Mayo, three daughters and two sons, of whom the sons Worrall William and William Damon and one daughter Helen Phoebe died in infancy. Dr. Mayo's deep affection for his family, his pride in them and his loyalty to them were a vital influence in his life.

In his first year as a physician W. J. Mayo began his faithful reading of medical journals and his frequent trips for postgraduate study and observation, first to Chicago and New York and soon to all parts of the United States and Europe, wherever he heard of men who were doing surgical work that was new or good or courageous. There are in the files of the Mayo Clinic the little notebooks he kept on those trips. The entries usually begin with city, date and hospital, the operating surgeon, his personal appearance and, sometimes, his mannerisms; the list of names is a roster of the world's great surgeons from 1883 into the early nineteen hundreds. Most of the notes are in pencil, a few in ink, occasionally made clearer by a crude sketch, and they concern preoperative care and postoperative care of patients; hospital routine, "for the Sisters"; technique of operations in all fields of surgery; and operating room equipment, including improvisations. An example is a memorandum made at the surgical clinic of Dr. W. S. Halsted, of Baltimore, in 1895, on the use of rubber gloves and rubber-soled shoes in the operating room, and of towels as aprons for quick changes at the operating table.

Even before he entered practice William J. Mayo was introduced by his father to organized medicine, at meetings of county, district and state societies; and once at a meeting of the American Medical Association, where he heard Dr. John L. Atlee, of Philadelhia, in tribute to his late great brother, Dr. Washington L. Atlee, and felt in accord with him in fraternal loyalty. As a young physician a little later Dr. Mayo occasionally attended a medical meeting in company with Dr J. B. McGaughey or Dr. Franklin Staples of Winona, for both of whom he always had affectionate and grateful regard because of their early kindly interest and encouragement; as he had for Dr. Nathaniel S. Tefft, of Plainview, who once saved him from error in a treatment that he was carrying out in youthful enthusiasm.

In 1883 he became a member of the Minnesota State Medical Society, in 1885 he helped to reorganize the Olmsted County Medical Society, in 1892 he became a member of the American Medical Association and in that year was a founder of the Southern Minnesota Medical Association. In the state group, as noted earlier, he served at various times on committees, was the first vice president in 1891, second vice president in 1892, and in 1893, the youngest man, until then, to hold the office, he was elected president. In 1899 he became a fellow of the American Surgical Association, on the proudest day of his professional life; in 1885 he had attended a meeting of the association, a young country doctor, and had thought wistfully of the glory of membership; in 1913-1914 he was the society's president. He was president of the American Medical Association in 1905-1906; the Society of Clinical Surgery, 1911-1912; American College of Surgeons, 1918-1919-1920; Congress of American Physicians and Surgeons, 1925; and the Interstate Post-graduate Medical Association of North America, 1932-1933. On his election to the presidency of the American Medical Association, Rochester honored him, his brother, who had just been elected president of the Minnesota State Medical Association, and his father, much as the city had honored Dr. W. W. Mayo in 1904, and presented Dr. W. J. Mayo with a three-handled silver loving cup on which was engraved, "Presented to Dr. W. J. Mayo by his many Rochester friends, July 24, 1905."

He early realized the importance of writing medical papers and of presenting them before scientific groups. In formal writing and formal public speaking he employed literary English concisely and effectively. Otherwise he used the vernacular and used it well. His custom in preparing a paper was to begin with an arresting sentence, follow it with text that required, except on rare occasion, not more than fifteen minutes for reading or delivery, and a cogent summary. He agreed with the old preacher who said, "Few souls are saved after the first fifteen minutes of a sermon."

At various times Dr. W. J. Mayo was a member, either health officer or secretary, of the Rochester Board of Health. From 1892 to 1900 he served on the Minnesota State Board of Health; when he resigned, in January, 1900, Governor John Lind appointed Dr. Charles H. Mayo to the vacancy.

By 1905 his list of society memberships, honorary degrees, medals and awards already was impressive, but it was only a fraction of what it was to be. In Portland, Oregon, in that year, when Dr. William L. Rodman, of Philadelphia, nominated Dr. Mayo for unanimous election as president of the American Medical Association he said, in small part, and informally: "At no one time, in no one place, has the complete list of the honors, degrees and memberships received by Dr. William J. Mayo been published, and this at his expressed wish. Not in lack of appreciation, he was deeply grateful to all who honored him, but because he felt that to make public as an authorized publication the world-wide list would savor of too much self-esteem." This was true of Dr. Mayo all his life. Honors that came to him he accepted as meant equally for his brother and the clinic as a whole.

For his service during World War I, as noted earlier, Dr. Mayo received the Distinguished Service Medal. On June 30, 1917, he received a letter from Surgeon-General William C. Gorgas of the War Department asking him to act as surgical adviser in General Gorgas' office and to select such men as he thought best in the surgical profession of the United States to act as his associates. Major Mayo accepted and on July 9, 1917, took up his duties. His first act was to secure the appointment of his brother, Dr. Charles H. Mayo, as alternate. Together they chose their associates. Throughout the war, as colonels, they served as alternating chief consultants; when one was in Washington, the other was in Rochester. Their official function was to insure and to maintain, as far as possible, the proper standard of character and professional ability of the physicians taken into the medical service of the army and to plan and carry out ways and means for their special training.

Dr. William J. Mayo began his medical and surgical practice officially on July 1, 1883; on July 1, 1928, he performed his last surgical operation. He turned quietly from the work he loved to apply himself to other professional endeavor in which he believed at sixty-seven he would be more useful. In his first years of practice he operated in every field then known. He did early and original work on cicatricial stricture of the esophagus. His first thyroidectomy, in 1890, in which Dr. C. H. Mayo was his assistant, was his last. After Dr. Charlie's surgical versatility became manifest, Dr. Will centered his attention on abdominal and pelvic surgery. His safe and simple method of overlapping repair of umbilical and postoperative abdominal hernias came into general use. His work in the field of liver, gallbladder and biliary ducts and pancreas is well known. He made enduring contributions in studies of the physiology and anatomy of the large intestine, rectosigmoid and rectum in relation to radical operations on these organs, and in surgery of the kidney, ureter and genital tract. His studies of diseases of the uterus and adnexa, with early standardization of abdominal myomectomy for the pregnant and the nonpregnant uterus, demonstrated the desirability of myomectomy over hysterectomy for the patient in the childbearing period. He is best known for his standardization of surgery of the spleen as related to operations for removal of the spleen for diseases of the blood and other conditions; for intensive studies of duodenal ulcer and gastric ulcer and for surgical procedures for their cure and prevention; and for perfecting radical operations for the curative removal of carcinoma of the stomach.

His keen intelligence and sensitive intuition made Dr. W. J. Mayo a rare judge of character and ability, an exceptional leader. He recognized opportunity and foresaw occasion; so delicately did he impart recognition and foresight that the recipients never became aware that certain new ideas on which they acted were not originally their own. Because of his seniority in the clinic he forced himself, outside the circle of family and close friends, to be impersonal, at sacrifice of the camaraderie that he would have enjoyed and that he missed. It has been said that he had too great dignity, too much reserve, that he was inflexible in his decisions. He was immovable only when there were in question professional integrity and the honorable progress of the clinic and the foundation on a basis of justice to all. In such matters of high obligation he accepted misunderstanding. His kindly tolerance was not a gift bestowed at birth, but was of gradual growth, the flowering of self-discipline and self-control.

With gradually changing economic conditions he recognized the need for change in the administration of the clinic. He saw depression coming years ahead and tried to prepare for it by preparing the members of the staff both as to mental attitude and as to financial safeguarding. His last twenty years were given largely to evolving and bringing into effect, in co-operation with able associates and advisers, basic principles for functioning of the clinic and the foundation. To this end he left his major funds, guarding carefully against suggestion of rule by the dead hand.

There remains uppermost in the memories of the many physicians who came under Dr. Will's teaching when they were green recruits, his kindness to young doctors, his understanding, his praise of all that could be praised, his few and always friendly corrections free from criticism. To a new and frightened assistant in the operating room who before an operation was reviewing the clinical data for him, he would say, "Remember, you are the architect, I am only the carpenter."

Of his compassionate understanding much is known, much cannot be told, because the telling would renew for many the pain of old sorrow and trouble through which Dr. Will sustained them or from which he rescued them. He restored courage and self-respect.

A member of the Episcopal Church, he was in active sympathy with the work of all denominations and valued the aid of the clergy in ministering to the sick. To needy and anxious patients he was doubly a life-giver, for by quietly relieving their financial worries he gave them increased chance for recovery. He used to say, "I understand and sympathize with the common man—the intelligentsia who are educated beyond their intelligence, I do not understand." And, on refusing certain high offices, "I want to be a plain, everyday doctor, holding the respect and esteem of the medical profession."

He was grateful for the recognition he received from the medical profession. He felt privileged to serve as a regent of the University of Minnsota from 1907 until his death. He had deep satisfaction in the usefulness of the clinic and in the realization of the Mayo Foundation for Medical Education and Research, which fulfills his supreme purpose of furthering better care of the sick. In his last weeks, lying where he could see the Mayo Foundation House, his former home, he had comfort in the knowledge that the house was fulfilling Mrs. Mayo's and his hope when they gave it, in August, 1938, that it would "become a meeting place where men of medicine may exchange ideas for the good of mankind."

When Dr. Mayo returned home in April, 1939, after spending the winter in Arizona, it was to undergo a clinical examination that resulted in discovery of a gastric lesion of the type to the surgical palliation or cure of which he had made major contributions. When he had looked at the x-ray picture, he spoke simply of the diagnosis and gave his own prognosis. His death occurred on July 28, 1939. Two days before he died he said, accepting the end with the calm spirit with which he had accepted all inevitable and unchangeable things, ". . . I have no regret except in the personal sorrow my going will bring. . . . It has been given to me more than to most men to realize my dreams." He had loved the truth and sought to know it.

In 1949 there survived Dr. William James Mayo, all of Rochester, Mrs. Mayo; two daughters, Carrie Louise Mayo, wife of Dr. Donald C. Balfour, and Phoebe Gertrude Mayo, wife of Dr. Waltman Walters; and nine grandchildren and fourteen great-grandchildren. Dr. D. C. Balfour, with the Mayo Clinic since 1907, is professor of surgery, the Mayo Foundation, Graduate School, University of Minnesota, and director (beginning October, 1947, emeritus director) of the Mayo Foundation. Dr. Waltman Walters, with the Mayo Clinic since 1920, is head of a section on surgery in the clinic and is professor of surgery, the Mayo Foundation. During World War II he served as captain in the Medical Corps of the United States Navy, in naval hospitals in the United States and at Aiea Heights, Hawaii.

Charles Horace Mayo (1865-1939), sixth child and younger son of Dr. and Mrs. William Worrall Mayo, was born in Rochester, Minnesota, on July 19, 1865.

Charles H. Mayo received his preliminary education in the common schools and the high school of Rochester, his early intensive training in premedical and medical subjects under his father, and practical experience in chemistry and pharmacology in a local drugstore during vacations. In September, 1885, he matriculated for a course of three years at the Chicago Medical College (the medical department of Northwestern University), a school known for its wealth of clinical material, its fine department of clinical and research laboratories, and its distinguished faculty. Here he came under the influence of Nathan S. Davis, John H. Hollister, Frank Billings and William E. Casselberry in medicine and under Edmund Andrews, John E. Owens and Ralph N. Isham in surgery, Walter Hay in nervous and mental diseases and Oscar De Wolf in state medicine and public hygiene, and others. After graduation on March 27, 1888, he returned home to begin practice with his father and his brother. On April 6, 1888, he received his Minnesota state license No. 23 (R). In the following year he made the first of his many trips abroad and on his return took his first formal postgraduate work, at the New York Polyclinic Medical School and Hospital, for which he received an ad eundem degree. Thereafter his trips for study were annual, so that the *Rochester Post* commented: "Dr. 'C. H.' keeps up with the times. Neither he nor his brother Dr. 'W. J.' lets any new method for improvement of practice pass unheeded or unlearned."

On April 6, 1893, Charles H. Mayo was married to Edith Graham, of Rochester, a sister of Dr. Christopher Graham and one of the thirteen children of Mr. and Mrs. Joseph Graham, pioneer settlers of Olmsted County. In notes on Dr. Graham (*q.v.*) in this article is included a brief history of this unusual family. Edith Graham, a graduate of the Woman's Hospital of Chicago in 1889, was the first trained nurse in Rochester and the first instructor in nursing and anesthesia at St. Mary's Hospital. After a few months in the home of Dr. and Mrs. W. J. Mayo, while their own house was rising next door, Dr. and Mrs. C. H. moved into their Red House; in 1912 they removed to Mayowood, a few miles from town. The hospitality of their home became traditional; Dr. Mayo was an inimitable host, Mrs. Mayo a hostess of rare tact and vivacious charm. They became the parents of eight children, Margaret, Dorothy, Charles William, Edith, Joseph Graham, Louise, Rachel and Esther, of whom Margaret and Rachel died in infancy; they had one adopted daughter, Marilyn, and a foster son, John Nelson. Dr. Charlie was happiest when his family were about him, as they always were when he was at home.

The outstanding qualities of Charles H. Mayo were his capacity for friendship, his sympathetic understanding of and approach to the common man, his catholicity of interests, his resourcefulness and ingenuity as a surgeon. Dr. Morris Fishbein said of him, "He was a man who understood how to talk to all mankind and who knew how to convey the story of medicine in its best way."

Genial, kindly, responsive to friendliness, for his own fullest enjoyment Dr. Mayo needed a group about him and the more varied the better. So diverse and so numerous were his interests and talents that life was endlessly fascinating to him. Student of books though he was, one who knew him well has said that he learned more from observation and listening than he did from study. He had the gift of gleaning from his travels not only useful scientific knowledge but innumerable interesting and amusing impressions, of social customs, art, music, architecture, government and what not. As a conversationalist and as a public speaker he had a charm all his own, a sense of humor that triumphed over the most formal occasion. When assigned a set subject, although he treated it with due consideration, he would interpolate remarks on many unrelated subjects, to the delight of his hearers and to his own enjoyment.

His mechanical ingenuity, which became of such great service in surgery, was an inherent gift. When he was a young boy, he could tinker toy engines successfully and repair deficiencies in household equipment; he constructed a workable telephone between home and his father's office. When St. Mary's Hospital was built, he designed and helped to install a hydraulic elevator, which was serviceable although it had a peculiarity that the designer could not then obviate: the apparatus could be operated only from inside the car, so that when the elevator had been left at an upper floor and was needed on a lower floor, someone would have to climb the stairs and bring it down. Dr. Mayo designed the first operating table used in the hospital, and devised superior surgical instruments, among them dissecting scissors, curved and straight.

A surgeon of exceptional skill and scientific discernment, he made contributions of enduring value in many fields of surgery, and originated operative procedures. In his earlier professional years he operated for cataract and for conditions of bones and joints. His method of operation for bunion came into general use. His anterior transverse open operation for suppuration of the knee joint met adoption in cases of the type in which amputation formerly had been practiced. He was early to operate successfully for brain tumor and for trigeminal neuralgia; one of the first to devise operations to relieve nerve compression by removal of supernumerary (cervical) ribs. He evolved a surgical technic to improve circulation of the blood in cranial skin grafts. He introduced an easy and ingenious method of vein stripping, one of the early procedures of surgical treatment for varicose veins, and designed an instrument for performing the operation. He advocated and used surgical treatment for arteriovenous aneurysms. In dealing with carcinoma he advocated and practiced removal of carcinoma and with it the associated lymph nodes at primary operation rather than waiting until the nodes were involved. He was early in devising operations for carcinoma of the tongue, cheek and jaw; and he brought to popular medical attention the two-stage exteriorization operation for carcinoma of the colon. To surgery of the urinary tract he contributed successful implantation of the ureters into the sigmoid (adaptation of the experimental method of Coffey) in the human patient for congenital exstrophy of the bladder; he developed the transperitoneal operation to open the bladder for removal of vesical tumors. He perhaps is best known for his researches on exophthalmic goiter, with Drs. H. S. Plummer, W. M. Boothby and E. C. Kendall, in working out the causation and frequency of the disease, methods of preliminary medical treatment and surgical procedures; his theory and practice have resulted in early diagnosis and cure in a high percentage of cases.

He had an almost uncanny ability to see possibilities of surgical treatment and to devise and adapt new operations. This facility was well known to his fellow surgeons, so that in 1914, when the American Surgical

Association met in Rochester, the visitors wanted to put it to the test. They asked Dr. Will, "Can't you pick out a case Charlie has not seen, a patient who has been operated on unsuccessfully two or three times and for whom little or nothing can be done surgically?" Dr. W. J. Mayo chose for presentation at the surgical clinic a patient who had been operated on seven times elsewhere and whose condition apparently was beyond surgical relief; the visiting surgeons saw the woman and agreed on the uselessness of further surgical intervention, and they were prepared to see Dr. Charlie baffled. When he was called in, he looked at the results of previous operations and whistled in dismay; then, to the visitors' amazement, he outlined an entirely new plan of operative procedure and carried it out successfully—and with lasting benefit to the patient.

Dr. C. H. Mayo did meritorious work toward the organization and functioning of medical societies, county, district, state, national and special. In 1888 he became a member of the Olmsted County Medical Society and of the Minnesota State Medical Society, and thereafter in the state group served at various times on committees, as censor, as chairman of the section on surgery and, in 1905-1906, as president. The great medical and surgical organizations of the country conferred presidency upon him: the Western Surgical Association, in 1904-1905; Society of Clinical Surgery, 1911-1912; Clinical Congress of North America, 1914-1915; American Medical Association, 1916-1917; American College of Surgeons, 1924-1925; Chicago and Northwestern Railway Surgical Association, 1927-1928; American Surgical Association, 1932-1933; Minnesota Public Health Association, 1932-1934; Interstate Postgraduate Medical Association of North America, 1934-1935. He was an active member of numerous other medical societies and of many groups devoted to the arts and sciences and to economic, civic and social welfare, and served on many committees and boards of trustees of those organizations. The list of his memberships, honors, medals and awards is extraordinarily comprehensive. He accepted such honors as meant for his associates as much as for himself. His record in Masonry was exceptional. His distinguished military record was discussed earlier in this paper. He was a supporting member of the Episcopal Church.

Dr. Mayo was actively interested in education of youth, and particularly in the extension and improvement of the public schools of Rochester. He was vice president of the city school board from May 15, 1915, to March 15, 1923. In this period he was influential in establishing in Rochester the junior college, the first junior college in the state, which gives the first two years of the university course. Enthusiastic about the Boy Scouts of America, he served as a member of the National Council and on committees of health and safety. In June, 1932, he became a trustee of Northwestern University and of Carleton College.

(To be continued in the April issue.)

President's Letter

FOR THE NINETY-EIGHTH TIME

For the ninety-eighth successive year, the Minnesota State Medical Association will meet in scientific, social and sports sessions—carrying on a tradition of professional and personal fellowship that has contributed to this state's reputation as an outstanding medical center.

This year the meeting is being held in Rochester, April 30, May 1 and 2, with business sessions beginning on Saturday, April 28. The Council and the House of Delegates will be considering important policy developments for the coming year and will hear reports on Committee work during 1950.

The Committee on Scientific Assembly has prepared a scientific program, especially designed to fit into busy schedules of practicing physicians and keyed to subjects of most general and current interest. Six topics will occupy the three-day session: Monday, April 30, "Fractures" in the morning and "New Drugs" in the afternoon; Tuesday, May 1, "Pulmonary Diseases" in the morning and "Acute Abdominal Conditions" in the afternoon; Wednesday, May 2, "Cardiac and Peripheral Vascular Diseases" in the morning and "Allergy" in the afternoon.

Dr. Wendell G. Scott, Associate Professor of Clinical Radiology, Washington University School of Medicine, St. Louis, Missouri, will present the Russell D. Carman Memorial Lecture; and Dr. Paul W. Schafer, Professor of Surgery and Chairman of the Department of Surgery, University of Kansas School of Medicine, Kansas City, Kansas, will give the Arthur H. Sanford Lectureship in Pathology.

Golf and skeet and trap shooting tournaments have been planned for Sunday, April 29, with attractive prizes and the Pfunder and Smith trophies to lure sportsmen.

Many groups are planning special dinners and luncheons—the Minnesota Chapter of the American Academy of General Practice, the Minnesota Medical Foundation and Alumni, the Minnesota Chapter of the American College of Chest Physicians, the Minnesota Radiological Society, the Northwestern Pediatric Society—to name a few.

It's a meeting that no physician can afford to miss—whether he is seeking knowledge, recreation or fellowship. Tear April 30, May 1 and 2 out of your professional calendar and plan to be there when the 98th annual convention of the Minnesota State Medical Association opens.

J. F. Norman

President, Minnesota State Medical Association

AMERICAN MEDICAL EDUCATION FOUNDATION

MOST medical schools are in more or less financial difficulties due to a number of factors—the increase in costs due to inflation, diminished returns from investments and the end to the support of medical students by the Federal Government.

How can the income of medical schools be increased? Certainly not by increased tuition. There is little prospect of a return of the days when large bequests were obtainable from wealthy individuals. To the proposal that the Federal Government be called upon to subsidize the medical schools, the answer of the medical profession is "No." Government subsidy means government control, according to a U. S. Supreme Court ruling. As an indication of how strongly the medical profession feels about the importance of medical schools maintaining their independence of the Federal Government, the Board of Trustees of the AMA appropriated a half-million dollars to establish what is to be known as the American Medical Education Foundation to accept funds to be used to support the hard-pressed medical schools of the country. The action of the Board of Trustees was unanimously approved by the House of Delegates of the AMA in December.

Physicians are urged to contribute, not a mere token contribution, but $100 per member if possible. Contributions of $100 have been coming in to the AMA office from individual members since the day following the announcement of the establishment of the fund. The California State Medical Association sent in a check for $100,000 for its members from the Association's reserves.

It is estimated that in the neighborhood of $10,000,000 will be needed yearly by the medical schools to maintain them in their present efficient status. Funds should be available this spring, and members are therefore urged to send in contributions promptly. Every physician has received more from his medical school than he paid in tuition. It is true that some physicians have paid back in services rendered to their Alma Maters, in some instances manyfold. Some have already made generous contributions to their Alma Maters and should not be expected to contribute to the American Medical Education Foundation.

While medical schools can be readily classified as publicly or privately owned, when the source of their operating funds is considered, the distinction is not so sharp. Publicly owned schools in many instances rely heavily on endowments and current gifts from private sources; on the other hand, privately owned schools receive some financial aid from city, state or federal tax funds. It is therefore entirely consistent with the existing pattern of medical school support that the National Fund for Medical Education not discriminate between publicly and privately owned institutions. No restrictions, also, are to be attached to the contributions to medical schools.

Contributions, both small and large, should be sent to the American Medical Education Foundation, 535 North Dearborn Street, Chicago 10, Illinois. Contributions are, of course, deductible for Federal income tax purposes.

THE AMERICAN ACADEMY OF GENERAL PRACTICE

ON MAY 1, 1946, a small group of Minneapolis physicians met to initiate an association of general practitioners. Up to that time, there was no local organization which those in general medical and surgical practice could call their own. As far as this writer knows, there was no such association anyplace in the country at that time.

A large number of specialty groups have been formed over a period of many years, and additional groups are still being formed. These groups were organized for mutual benefit and general fellowship, as well as for specific promotion and advancement of these various specialties. The individuals in each group found that their problems were similar and that their aims followed the same general path. It was natural that many common ties would bind these individuals into a cohesive group. It was likewise natural that those who have a common interest in the general practice of medicine should wish to have their own organization.

After the Minnesota group—then known as the American College of Physicians and Surgeons—began to make headway, other similar organizations sprang up in other parts of the country. It was inevitable that these groups of similar purpose would unite in one larger organization, national in scope. Thus it was the American Academy of General Practice came into being in 1947. The Minnesota group was absorbed February 1, 1948.

In addition to this sketchy account of the organizational background of the American Academy of General Practice, it might be well to dwell briefly on this group's aims and purposes. At the outset, it should be pointed out that this is not an "anti-specialists" association or a "gripers" organization. In the very beginning some of the cohesiveness of the local group was motivated by indignation over staff regulations in some of the hospitals. In the main, the causes for complaints and dissatisfactions have been eliminated, and the Academy's primary concern now is the building up of that great segment of the medical profession—the general practice group. The Academy's purpose is that of mutual fellowship—its paramount aim, the betterment of the general practice of medicine.

The American Academy of General Practice publishes its own journal—the "G.P." This is conceded to be a very fine publication. The editor is the inimitable Dr. Walter Alvarez. The organization sponsors an excellent annual meeting and encourages postgraduate study in the interim by giving credits for such study. The American Academy of General Practice also has issued a manual on the establishment of Departments of General Practice in Hospitals. The principles expressed therein have been incorporated in the "Manual on Hospital Standardization" of the American College of Surgeons.

It is only natural that the older, more established medical organizations would look with some suspicion at this new organization during its early development. The American Academy of General Practice is now definitely past its infancy and gives every promise of robust growth and stable character.

The Editorial Staff of MINNESOTA MEDICINE feels that it voices the feeling of the membership of the Minnesota State Medical Association in again affirming* its confidence in the American Academy of General Practice and in wishing the Academy and its publication "G.P." every success.

BILL S.1, SECTION 23

THE SOCIALIZERS in Washington are ever on the alert to seize opportunities to involve the Federal Government in providing medical care for U. S. citizens. The serpent of socialistic governmental medical care is scotched—not killed.

The latest example is Bill S.1 recently introduced in the U. S. Senate. Section 23 of Bill S.1 authorizes the President to socialize medical care for a large segment of the population—those rejected for failure to meet the standards for physical and mental fitness established for the draft. The field involved is only vaguely related to defense. The Bill proposes to take advantage of the draft to provide medical care at the expense of the Federal Government for those rejected. While medical men would recognize that here are citizens, a portion of whom—but probably a smaller portion than most people think—have remediable defects which should be cared for, yet we ask why at governmental expense? This would be extension of state medicine for several million more citizens.

The profession is downright opposed to Bill S.1. Rejected draftees who have defects uncovered in the process of the draft should obtain medical advice on their own responsibility and, if unable to finance a medical examination and treatment, should consult one of the many facilities provided for the medically indigent. Bill S.1, if enacted, would cost the taxpayers billions, a large portion of which would be spent uselessly for disabilities beyond the power of medical science to alleviate or cure. And this Bill is proposed at a time when the country is forced to exert all its energy and resources in providing military defense and economizing in every other non-essential governmental activity. When will our lawmakers realize the seriousness of our financial condition with inflation still on the up grade and the people taxed to the breaking point?

FERTILITY IN CRYPTORCHIDS

THE ARTICLE on "Fertility in Cryptorchids" by Dr. Charles E. Rea, which appears in this issue, contains the operative results following Wangensteen's modification of the Keetley-Torek operation on eight young men with bilateral cryptorchidism.

According to the author, this report includes all his bilateral cases in which operation has been performed ten or more years ago. All eight of his subjects are married, no pregnancy has resulted, none of the testes is normal in size, and in the four tested no sperm was found on testicular biopsy.

To the unbiased reader, this would seem to be an honest admission of 100 per cent failure in the main objective of the operation—the development of a normal functioning testis by placing it in its normal position. It would seem that the author's statement, "There is no question but that the placing of an undescended testis in the scrotum allows the gonad to develop to varying degrees," requires further amplification.

Dr. Rea makes the distinction between pseudocryptorchidism and true undescended testicle as others do. The term pseudocryptorchidism is used for those cases in which the testis at times is palpable and can be pushed down into the scrotum. In the author's opinion, these are the cases in which spontaneous descent usually occurs. There is general agreement on this point. But how about the youngsters in whom upon examination the testis is not palpable? They would seem to be true cases of cryptorchidism. What percentage of these testes will fail to descend spontaneously? Just which ones will be "anatomically retained" no one can predict. That only a small percentage of these true cryptorchids —testes that cannot be palpated—will fail to descend at puberty has been contended, with considerable supporting evidence.* If the great majority of undescended testes descend spontaneously, are normal in size and therefore presumably functioning normally, there is every reason to refrain from operation. If it were a fact that only a few undescended testes descend spontaneously, still that would be a sufficient reason for refraining from operation, if operation is 100 per cent failure as indicated by Dr. Rea.

It would be of interest if other surgeons would report on their experiences with fertility in patients operated upon for bilateral undescended testes. It is in the bilateral case that it is highly important that the correct advice be given.

FEE SPLITTING STILL

IN HIS presidential address before the Ramsey County Medical Society, which appears in this issue, Dr. Warner Ogden points a finger of scornful ridicule at the surgeon who allows the referring physician to assist (?) at the operation in order presumably to justify a splitting of the fee. Most surgeons who merit the appellation have their teams of one or more assistants. The technical performance is of a much better quality as a result of the team work. An outsider who may not have assisted at an operation since his interne days and may never have really learned operating-room technique is of no real help in the performing of the operation, and the danger of disrupting his aseptic technique is not only a hazard but should be distracting to the surgeon. The would-be assistant is taking a fee which he did not earn. The surgeon, in reality, has split his fee in order to induce the referring practitioner to send him more work.

After all that has been said and written about the evils of splitting fees and the stand that has been taken by county, state, national and surgical societies, it seems unbelievable that the practice still continues. All one has to do to find out who the surgeons are who place "business" before the welfare of their patients in this manner is to peep into the operating rooms or keep his ears open in the cloak-rooms of the hospitals. The guilty ones may rest assured that their identities are well known among their confreres.

The medical societies have taken a stand on this practice. It could be stopped by the Executive Committees of the hospitals. They, therefore, share in the guilt.

LEGISLATURE GETS MENTAL AID BILL

A new bill before the Minnesota state legislature, provides for the licensing of mental aids in the state. Leaders in the Minnesota mental health program favor this plan, and it has Governor Youngdahl's support, who said of it, "This plan will give incentive to our psychiatric aids. They will have a goal to strive for."

The bill would set up a five-member board to license aids, but would not make it more difficult to get workers, according to the governor. The plan would be a voluntary one—any aid who wishes to qualify may do so.

As it stands now, H. 113 requires that any person who wishes to become a registered psychiatric aid must take an examination, which would be "practical and designed to test the applicant's fitness, education, training and experience" to perform successfully the duties of a psychiatric aid.

It is felt that this bill would greatly aid Minnesota's mental health program by providing more competent people to work with the mentally ill. Experts in the mental health field have called the aid "the most important worker in the mental hospital. The aid works more closely with the patient than any other member of the hospital staff."

CONGRESS TO WEIGH NEW HEALTH BILLS

As the 82nd Congress meets amid stiff arguments and petty bickering, it finds itself confronted with many new and many old proposals concerning the health and welfare of the nation as a whole. Of the more than 1,000 bills introduced so far in the House alone, about one in every ten deals with medical care, hospitalization or some other health issue.

Among the carry-overs from the 81st Congress are: national health insurance, income tax deduction of medical and dental expenses, Federal support of school health services, income tax deduction of sums paid into prepayment health service plans, Hill-Burton Act amendments, various veterans' medical care bills, greater benefits for dependents of military personnel.

The new bills include one dealing with Federal aid to nursing education; the upholstered bills on support of local public health units; H. R. 1502, restoring the $65 million cut from this year's Hill-Burton operations; S. Res. 39, giving a two-months time extension (until March 31) to the special investigation of prepayment medical and hospital plans; H. R. 1611, establishing a National Poliomyelitis Institute; H. R. 1644, offering $100,000 a year for life, to individuals discovering "general cures" for cancer, heart disease and poliomyelitis; S. 486, enlarging utilization of Indian hospitals; and S. 513, to study injuries to health suffered by Americans who were prisoners of war.

JOURNAL CALLS BILLS "SAME OLD PACKAGE"

Looking over President Truman's slate of bills and his budget for the coming fiscal year, the *Wall Street Journal* could only call the whole thing "the same old package." No doubt the *Journal* felt, too, that the package's wrapping and ribbon—increased defense spending—was an excellent disguise with which to push through administration welfare schemes.

Checking Truman's list of proposed legislation, the *Journal* found nothing new and spectacular:

> "The old, rejected Brannan farm plan in a disguised form, which by means of subsidies, would give high prices to farmers for their perishables and simultaneously low prices to the housewives.
>
> "A government-operated and government-subsidized national medical plan.
>
> "Expand the federal government's costly unemployment insurance program.
>
> "Federal government subsidies for the nation's schools, including nursery schools. . . .

"And—Congress willing, of course—we should also go ahead with a general expansion of the government's power to look after our private lives, including an expansion of rent control, the adoption of a 'fair employment' law and the complete control of prices and wages."

The *Journal* exposes the flagrant disregard for economy in government at a time when the nation's economy should run smoothly:

"Behind all this program is a philosophy which says that the cost of anything or everything is a matter of no consequence whatsoever, that a government can tax as much as it will and can spend as much as it will without hurt and provide not only anything but everything at once. Hence the mere fact that a government is tripling its armament expenses need not in the least deter it from spending as many other billions as it wishes."

Congress Will "Reject" Bills

The *Journal* expresses many Americans' attitude when it states that the President's proposals are the same as his old Fair Deal package, repeatedly presented to Congress, and which Congress "just as repeatedly, has rejected . . .":

"These economic pills can be covered with a 'defense emergency' coating now. But they're pills just the same. We will expect Congress to reject them even more firmly now."

WRITER ADVISES ETERNAL VIGILANCE

Felix Morley, writing in *Nation's Business* recently, struck a warning to Americans concerning the vast national power and control which come with any national emergency declaration.

President Truman's "national emergency," coupled with his "same old package" legislation, represent a threat to American freedoms, Mr. Morley said. He felt that "the people themselves, and their elected representatives, must be on guard to prevent undue encroachments on their own rights by their own officials. And this eternal vigilance, which is the price of liberty, is doubly imperative at a time when external danger makes usurpation of power by officials seem reasonable, if not essential."

Sensing that President Truman may be trying to put something over on them by slipping Fair Deal legislation into his huge budget which includes defense legislation, Americans can agree with Mr. Morley's view:

"Although the fundamental safeguards of individual liberty continue to stand, it is obvious that the powers now assumed by the Executive constitute a potential threat to every American home. This is not less true because this centralized power is being built up to meet the threat of external aggression. Many a people have lost their freedom in the belief that they were defending it against a foreign foe. Indeed the most subtle way to destroy liberty is to argue that it is a fair-weather luxury which must be sacrificed during a period of national peril."

Americans will also agree that during a time of national peril, it is even more important for liberty to be guarded, for only a free people can best aid themselves to reduce that national peril. Conscientious citizens resent and combat the introduction of any legislation tending to threaten their fundamental liberties. They, like Congress, do not find it easy to swallow Truman's defense-legislation-coated pill because they know it contains harmful ingredients in varied ominous forms.

Mr. Morley concludes that the remedy is not to give more power to officials:

". . . the remedy certainly does not lie in granting ever more power to officials who cannot now effectively command that which is already in their grasp. It lies, rather, in restoring the balance that our forefathers wrote into our Constitution—a document which could profitably be dusted off and reread before it becomes a dead letter.

"Such re-examination would recall Madison's warning that, while the first necessity is a government that can control the governed, it is of equal importance to insure that the government shall be obliged to control itself."

SOCIALIZED MEDICINE CALLED ALIEN BLIGHT

A recent editorial in the *Seattle Post Intelligencer* applied one of the most accurate labels to compulsory health insurance that has yet been used:

"Compulsory health insurance is not an American invention. It originated in Bismarck's Reich: and it had grievously impaired German medicine long before the Nazi degradation started . . .

"The progress of medical science has been impeded, and the quality of medical service has deteriorated.

"Nonetheless, the 'social planners' want to import the alien blight of socialized medicine into this country."

Lauds Medical Profession

Praising American doctors for their crusade against socialized medicine, the newspaper said that "never before in the United States, however,

SECOND INTERNATIONAL POLIOMYELITIS CONFERENCE

The second International Poliomyelitis Conference will be held at Copenhagen, Denmark, September 3 to 7, 1951. This will constitute the first formal meeting of the International Poliomyelitis Congress. Mr. Basil O'Connor is president of the Congress, and the National Foundation for Infantile Paralysis and the Danish National Association for Infantile Paralysis will sponsor the Congress. Dr. Niels Bohr is president of the Conference.

Governments are invited to send representatives to the Conference, and invitations are also sent to universities and scientific institutions as well as to scientists and doctors. The four official languages will be English, Franch, German and Spanish, and simultaneous interpretation into each of the three languages not being used at the moment will be made, just as at the United Nations.

The *M.S. Stockholm* of the Swedish-American Lines will sail from New York on August 25, arriving at Copenhagen on September 2. Reservations for sailing are to be made through Thomas Cook & Son, 587 Fifth Avenue, New York 17, N. Y.

AMERICAN GOITER ASSOCIATION

The 1951 meeting of the American Goiter Association will be held in the Deshler-Wallick Hotel, Columbus, Ohio, May 24, 25 and 26.

The program for the three-day meeting will consist of papers dealing with goiter and other diseases of the thyroid gland, dry clinics and demonstrations.

MICHAEL REESE HOSPITAL POSTGRADUATE SCHOOL

The Michael Reese Hospital Postgraduate School is offering a one-week course in "Clinical Dermatology—Refresher Course in Diseases of the Skin for General Practitioners." This full-time, intensive course will meet from April 2 to April 7. Clinics and lectures will be conducted by the members of the Department of Dermatology and Syphilology.

The school is also offering a one-week course in "Surgery—Indications, Pre-operative and Post-operative Care" from April 9 to 14. Clinical and didactic material in this full-time course will be presented by members of the Department of Surgery and co-operating departments.

A two-week course will also be offered in "Recent Advances in Internal Medicine." This full-time, intensive course will meet from April 30 to May 12. Clinical and didactic material pertaining to recent advances in diagnosis and therapy will be presented by members of the Department of Internal Medicine, other clinical departments and the Division of Laboratories and Research. For further information, address: Dr. Samuel Soskin, Dean, 29th St. and Ellis Ave., Chicago 16, Illinois.

MINNESOTA SOCIETY OF NEUROLOGY AND PSYCHIATRY

The regular meeting of the Minnesota Society of Neurology and Psychiatry was held in Saint Paul on March 13.

The scientific program included the following:

"A Clinical Evaluation of Carotid-Jugular Anastomosis in Mental Deficiency; a Report of Ten Cases" by Dr. Ivan Baronofsky, Dr. J. W. Bussman, Audrey Stenberg, and Dr. Reynold A. Jensen.

"Drug Therapy in Parkinsonism," inaugural thesis, by Dr. Sidney K. Shapiro.

CLARENCE M. JACKSON LECTURE

Dr. Carl E. Badgley, professor of surgery at the University of Michigan, delivered the annual Clarence M. Jackson lecture at the University of Minnesota on March 1. The title of his address was "Fractures about the Hip—Early and Late Therapy."

The program, which was open to the public, is sponsored each year by Phi Beta Pi medical fraternity as a memorial to Dr. Jackson, former head of the University's anatomy department who died in 1947.

"... *in the minds of men* ..."

In treating the disorders that exist in the minds of men, psychiatric nursing plays a vital role. Proper care can be given patients only by properly trained psychiatric nurses.

In view of the present shortage of such trained nurses, and the desperate need for them, the Glenwood Hills Hospitals School of Nursing, Neurology and Psychiatry is appealing to you physicians for aid in solving this problem.

By sending us the name of a promising nursing candidate in your community—a girl aged seventeen or over, with a high school education—you will be doing your part to alleviate this critical nursing shortage.

Our one-year course in psychiatric nursing is tuition-free. Our graduates have an excellent professional career before them.

Please send the name of a potential nursing recruit to

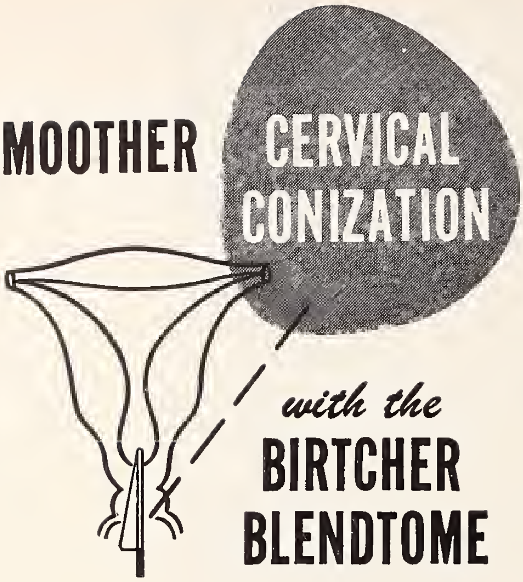
SMOOTHER CERVICAL CONIZATION



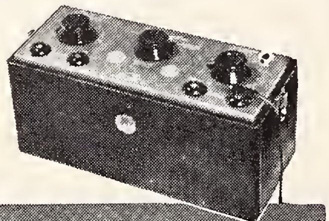
with the

BIRTCHER BLENDTOME

Frequent necessity of cervical repair suggests the practicality of having a BLENDTOME ELECTROSURGICAL Unit in the office or clinic. With this instrument, the doctor is enabled to do a smoother cervical conization. The BLENDTOME cuts and coagulates simultaneously with a blended current. Scar and other tissue is cut through quickly and easily; blood and lymph vessels are almost instantly sealed. The cleaner field results in reduced trauma and operative shock, smoother convalescence and more rapid healing.

The Birtcher BLENDTOME was *designed* for use in the doctor's office or private clinic. It provides electrosurgery for all but the strictly major cases. There are many everyday uses for the BLENDTOME—any case indicating fast and sure cutting with simultaneous sealing off of blood and lymph vessels.

Consider how much more you would be able to do with the ease, timesaving and effectiveness of a Birtcher BLENDTOME in your own office. Write for literature.



THE BIRTCHER CORPORATION

To: The BIRTCHER Corp., Dept. MIN 3-51
5087 Huntington Dr., Los Angeles 32, Calif.

Please send me, by return mail, free brochure on the portable Blendtome Electrosurgical Unit.

MINNEAPOLIS ACADEMY OF MEDICINE

Dr. John A. Haugen was elected president of the Minneapolis Academy of Medicine at the annual meeting of the organization on February 19. Other officers include Dr. Donald C. MacKinnon, vice president; Dr. Chauncey N. Borman, secretary, and Dr. U. Schuyler Anderson, recorder.

HENNEPIN COUNTY SOCIETY

President-elect of the Hennepin County Medical Society is Dr. William R. Jones, who will succeed Dr. Reuben F. Erickson as president next October. Vice presidents include Dr. Reuben A. Johnson and Dr. James B. Carey. New members of the board are Dr. Robert F. McGandy and Dr. Silas C. Andersen.

McLEOD COUNTY SOCIETY

Election of officers was held at the annual meeting of the McLeod County Medical Society in Glencoe on January 18. Dr. L. L. Kallestad, Brownton, was elected president of the group, succeeding Dr. Arthur Neumaier of Glencoe. Dr. J. D. Selmo, Norwood, was named secretary-treasurer.

RAMSEY COUNTY SOCIETY

New officers of the Ramsey County Medical Society were installed at a meeting of the group in Saint Paul on January 29. President is Dr. F. G. Hederstrom; secretary-treasurer, Dr. Laurence Hilger, and president-elect, Dr. J. P. Medelman.

RICE COUNTY SOCIETY

At the annual meeting of the Rice County Medical Society on January 16, Dr. C. A. Traeger, Faribault, was elected president of the organization. Other officers named include Dr. R. F. Mears, Northfield, vice president, and Dr. J. J. Kolars, Faribault, secretary-treasurer.

Dr. Heinz Bruhl, Faribault, Dr. R. H. Buesgens, Waterville, and Dr. Guy Walter, Farmington, were accepted into membership in the society. The membership now totals thirty-five.

WASECA COUNTY SOCIETY

At a meeting of the Waseca County Medical Society in Waseca on January 16, Dr. S. C. Oeljen was elected president of the organization. Also named to office were Dr. G. E. Olds, vice president, and Dr. Anthony Ourada, secretary-treasurer.

WINONA COUNTY SOCIETY

Dr. Paul Heise was elected president of the Winona County Medical Society at its meeting in Winona on January 8. He succeeded Dr. H. J. Roemer in the office.

Other officers named included Dr. L. F. Johnston, vice president; Dr. H. R. Schmidt, secretary, and Dr. W. O. Finkelnburg, treasurer.

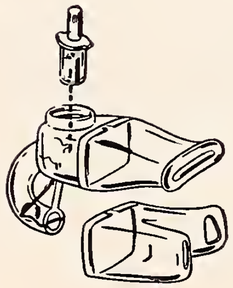
Have you tried the Aerohalor in treating secondary invaders *of the Common Cold?*

Let us make this point clear at the beginning. We do not recommend penicillin powder inhalation therapy with the Aerohalor as a cure for the virus cold. It is not. But Krasno and Rhoads[1] have some interesting observations: "The course of ordinary colds is strikingly shortened by prompt use of the penicillin dust inhalation. We have no illusions that it is effective against virus that initiates the common cold or any other viruses."

The authors also report: "We are fully aware that the etiologic agent of the common cold is probably not a penicillin-sensitive organism. Secondary invaders undoubtedly account for the accentuation of the initial symptoms and in most instances for the more serious complications. Dramatic results often are seen in those patients in whom the cold has been hanging on."

As to the therapeutic effectiveness of inhaled penicillin dust, Krasno and Rhoads state "with assurance" that "bacterial infections of the nasopharynx, para-nasal sinuses, nasal mucosa, larynx and trachea of fairly recent origin, respond well to this form of treatment."

The smoke-it-like-a-pipe therapy afforded by the Aerohalor is convenient and effective. For the complete story, write for comprehensive literature to Abbott Laboratories, North Chicago, Illinois. Abbott



Aerohalor®

(ABBOTT'S POWDER INHALER)

Aerohalor comes assembled with detachable mouthpiece. Easily interchangeable nosepiece included in package. Disposable Aerohalor* Cartridge containing 100,000 units of finely powdered penicillin G potassium is prescribed separately—three to an air-tight vial.

*Trade Mark for Abbott Sifter Cartridge. Aerohalor and Aerohalor Cartridge patented in U. S. and Foreign Countries.

CONTINUATION COURSES

Urology.—The University of Minnesota announces a continuation course in urology to be presented at the Center for Continuation Study on April 2 to 6. The course is given under the sponsorship of the North Central Section of the American Urological Association. Dr. C. D. Creevy, professor of surgery and head of the Division of Urology, is faculty chairman for the course.

Distinguished visiting physicians who will participate are Dr. Hugh J. Jewett, Baltimore, Maryland; Dr. Lloyd G. Lewis, professor, Department of Urology, Georgetown University Medical School, Washington, D. C.; Dr. Reed M. Nesbit, professor and chief, Department of Urology, University of Michigan Medical School, Ann Arbor; and Dr. Parke G. Smith, professor and head, Department of Urology, University of Cincinnati, Cincinnati, Ohio.

Lupus Erythematosus.—A postgraduate symposium on lupus erythematosus will be presented at the Center for Continuation Study, April 5 and 6. The symposium is intended especially for doctors specializing in dermatology and internal medicine. A cordial invitation is also extended to general physicians.

Distinguished visiting physicians who will participate include: Dr. John R. Haserick, Cleveland, Ohio; Dr. Paul Klemperer, Mount Sinai Hospital, New York; and Dr. Louis J. Soffer, assistant clinical professor, Department of Medicine, Columbia University, New York City. The remainder of the faculty will be made up of members of the staff of the University of Minnesota Medical School and the Mayo Foundation. The course is given under the direction of Dr. Henry E. Michelson.

SERVICE BROWN & DAY INC SAINT PAUL U.S.A. QUALITY

BROWN & DAY, INC.

St. Paul 1, Minnesota

Gynecology.—A continuation course in gynecology will be presented April 9, 10, and 11 at the Center for Continuation Study of the University of Minnesota. The course is intended for general physicians and will emphasize problems of the menopause, uterine myomas, and benign ovarian tumors. Dr. H. C. Hesseltine, professor of obstetrics and gynecology, University of Chicago, will be the visiting faculty member for the course. The course is presented under the direction of Dr. John L. McKelvey, head of the Department of Obstetrics and Gynecology.

Proctology.—The University of Minnesota announces a continuation course in proctology to be presented at the Center for Continuation Study on April 16 through 21. The course is intended for doctors of medicine who are engaged in general practice and surgery. Throughout the course emphasis will be placed upon those anorectal and colonic lesions most frequently seen by practicing physicians. The presentation will be by means of lectures, operative clinics, motion pictures, and seminars. Guest faculty member for the course will be Dr. Robert A. Scarborough, associate professor of surgery, Stanford University Medical School, San Francisco, California. The remainder of the faculty for the course will be made up of clinical and full-time members of the staff of the University of Minnesota Medical School and the Mayo Foundation.

Electrocardiography.—A continuation course in electrocardiography will be presented by the University of Minnesota on May 7 to 11. The course is intended for general physicians and will be presented at the Center for Continuation Study. Dr. George E. Burch, professor and chairman, Department of Medicine, Tulane University of Louisiana, New Orleans, and Dr. Harry E. Ungerleider, medical director of research, the Equitable Life Assurance Society, New York City, will be the visiting faculty members for the course. In addition, Dr. Burch will give the first annual George E. Fahr Lecture on May 8. This lecture is, of course, presented for all physicians and students who are able to attend.

Minnesota Multiphasic Personality Inventory.—A continuation course on the Minnesota Multiphasic Personality Inventory will be presented for general physicians at the Center for Continuation Study on May 14 by the University of Minnesota. The mechanism, interpretation, and clinical use of the test will be discussed.

The immediate need in the control of cancer is for more accurate early diagnosis and to accomplish this desired result there must be offered to the general practitioner more active co-operation with detection centers.

The surgical biopsy still holds first place for accuracy in diagnosis. It is readily available for all extrinsic lesions and whenever possible should be relied upon for the final opinion.

The "estrogen preferred by us is 'Premarin,' a mixture of conjugated estrogens, the principal one of which is estrone sulfate."

Hamblen, E. C.: North Carolina M. J. 7:533 (Oct.) 1946.

In treating the menopausal syndrome with "Premarin," Perloff* reports that "Ninety-five and eight tenths per cent of patients treated with 3.75 mg. or less daily obtained complete relief of symptoms"; also, "General tonic effects were noteworthy and the greatest percentage of patients who expressed clear-cut preferences for any drug designated 'Premarin.'"

Thus, the sense of "well-being" usually imparted represents a "plus" in "Premarin" therapy which not only gratifies the patient but is conducive to a highly satisfactory patient-doctor relationship.

Four potencies of "Premarin" permit flexibility of dosage: 2.5 mg., 1.25 mg., 0.625 mg. and 0.3 mg. tablets; also in liquid form, 0.625 mg. in each 4 cc. (1 teaspoonful).

Woman's Auxiliary

MID-WINTER BOARD HEARS DEFENSE SPEAKER

Mrs. Charles W. Waas, President

It is difficult to select a date for the board meeting which will be satisfactory to all, but when January 29 was planned, it was hoped that Minnesota might be enjoying its "January thaw" at that time, and it was thought that the fifth Monday of the month would not conflict with any regular meetings members might have. However, the "January thaw" did not appear. Nevertheless, thirty-nine members braved the weather and attended a very enjoyable and a very interesting meeting.

The subject of cancer played an important part on the program at the Workshop meeting in the fall. At the Mid-Winter Board Meeting civilian defense was the topic, and a most interesting discussion was given by Paul Wilson, a member of St. Paul's Civil Defense Committee. This was followed by an educational film concerning precautions and methods of protection which every citizen must follow in case of an atomic bomb attack. The film was commented upon by Colonel Paul Calder.

There were splendid reports given by various chairmen and county presidents. It is regrettable that the weather made it impossible for so many to attend. It would be profitable to all county presidents to get in communication with any of the state chairmen who might be able to help them with their particular problems. The women who are serving in this capacity are outstanding and they will be very happy to help. Please do not hesitate to write to your president, if there is any help she can give.

SAMPLE DRUGS STILL NEEDED

Mrs. B. E. O'Reilley, Chairman
Committee on Medical and Surgical Relief

Undoubtedly, auxiliary members have started collecting sample drugs, discarded instruments, medical textbooks and journals from their husbands' offices, and packing them for shipment overseas.

Mr. Pedro Velasco, President, Philippino Relief Organization, 3009 Ewing Avenue North, Robbinsdale, Minnesota, will be pleased to accept any number of boxes of drugs and materials. He will repack the drugs and pay the freight charges from Robbinsdale to the Philippines. Mr. Velasco is very enthusiastic about the auxiliary's offer to send drugs—also instruments, books and journals—as his organization is trying to equip a hospital recently built in Manila. Boxes of drugs will also be sent to dispensaries in the Provinces. Boxes of drugs (no books or journals), may be sent to the Medical and Surgical Relief Committee, Inc., 420 Lexington Avenue, New York 17, New York, for shipment overseas.

This is an excellent opportunity for members to do a very worth-while charitable work as drugs are badly needed and will be very much appreciated.

AUXILIARY WATCHES LEGISLATIVE ACTION

Mrs. L. R. Scherer, Legislative Chairman

With both federal and state legislative bodies now in session, doctors' wives should be interested in, and alert to the bills affecting the medical field either directly or indirectly.

Members can watch daily papers to check on the status of Minnesota bills, and can learn which ones the American Medical Association favors on a national basis, with the reasons for their objections to those they disapprove.

The last few years have proven that when information and facts are given to the people, public opinion is formed that is still effective. However, to be effective, the law makers must be made aware of the wishes of the people. Therefore, members should (1) continue to inform themselves; (2) work with other organizations to spread that information; and (3) write to Congressmen and ask others to write also.

If members do these things, they will be participating as good citizens to preserve freedom and democracy at home, during this period of world crisis.

AUXILIARY AIDS OLDSTERS GROUP

The Saint Paul Auxiliary, Ramsey County Medical Society, is supporting a special project in developing an expanded program of leisure time activity for the aged at Capitol Community Center, 190 E. 15th Street, Saint Paul. This center is a Community Chest agency and services a downtown neighborhood, which, because of its age and location, has within it many social problems.

The area has a high incidence of older people living within a short distance of the Center's location. Most of these people are living by themselves in rooming houses and are receiving Old Age Assistance. There are no community facilities in the neighborhood to provide a program for them. The Community Center's program for the aged began in 1947, and has never expanded because of the lack of staff to visit the oldsters and recruit them. The Auxiliary's grant will provide money for a staff leader who will not only give direct leadership, but will make home visits in an effort to get the older people to come.

The Oldsters Group meets every Wednesday afternoon at the Center from 1:00 to 3:30 p.m. While there is an active and varied program consisting of table games, Bingo, crafts, parties, singing and folk dancing, their main emphasis is on chatter and refreshments, to which they eagerly look forward. They also observe birthdays and have monthly parties. The project is designed not only to provide a place where oldsters can come, but to revive their latent and dormant skills and feeling of self-possession, which many of them have long lost. Personal service, in the way of health and case work

referrals, is also a part of the program, and the worker spends some time having individual chats with several of the older people who indicate their desire for it.

The staff includes Mrs. Eleanore Felker, supervisor; Mrs. Robert Dunning, volunteer assistant leader; and Russell Lind, group leader and home visitor.

In addition to financial support, the Auxiliary will help with leadership at special events and with volunteer drivers to help get oldsters who are non-ambulatory, to and from meetings.

MESSAGE FROM COMMITTEE CHAIRMAN

Mrs. John J. Ryan, 2153 Iglehart, Saint Paul, chairman of the In Memoriam Committee requests that all county presidents report to her as soon as possible the names of deceased members to be remembered at the memorial service at the annual meeting of the State Auxiliary. This meeting will be on Tuesday, May 1, Rochester Country Club, Rochester, Minnesota, in conjunction with the annual meeting of the Minnesota State Medical Association, April 30, May 1 and 2, in Rochester.

ASSASSINATION OF GARFIELD

(Continued from Page 233)

We still have sepsis in gunshot wounds, but we are much better equipped to control it than were our professional brothers of Garfield's time. It would seem that the President might well have recovered in our time. This is no reflection upon Garfield's doctors, who, according to the record, gave the most meticulous and scientific care to the President possible in their time.

Honorable James G. Blaine gave the memorial address for President Garfield before Congress on February 27, 1882. He closed with these words:

> "As the end drew near, his early craving for the sea returned. The Stately Mansion of Power had been to him the wearisome hospital of pain, and he begged to be taken from its prison walls, from its oppressive, stifling air, from its homelessness. Gently, silently, the love of a great people bore the pale sufferer to the longed-for healing of the sea. To live or die as God should will, within the sight of its heaving billows, within the sound of its manifold voices; with wan-fevered face, he looked out wistfully upon the ocean's changing wonders, on its far sails, whitening in the morning light, on its restless waves rolling shoreward to break and die beneath the noonday sun, on the red clouds of the evening, arching low to the horizon, on the serene and shining pathway of the stars. Let us think that his dying eyes read a mystic meaning which only the Rapt and Parting Soul may know. Let us believe that in the receding world he heard the great waves breaking on a farther shore, and felt already upon his wasted brow the breath of the Eternal Morning."

SURVIVAL OF THE FITTEST

There are those who, looking at the high maternal mortality and morbidity statistics of the Negro minority in the United States, are inclined to shrug it off with the belief that it is due to "degeneration, a manifestation of imperfect physical development or to simple racial inferiority." Dr. Leonard Goodman, Obstetric Surgeon to the Gold Coast Colony in British West Africa, pointed out at the recent International Obstetric Congress that the American Negro originally sprang from this part of the world. "The slaves from the Western world were mainly derived from tribes in the North and sold to coastal potentates who resold them to the masters of the ships that awaited them." Comparing the American Negro, however, with his native counterpart in Africa, Dr. Goodman is much impressed with the physical superiority of the American Negro. He attributes this in part to the Darwinian principle of the survival of the fittest. "The voyage in a densely crowded and insanitary vessel put these qualities to the greatest test," he said, "and those who eventually landed on this soil must have been the most robust specimens of this race, and no doubt the physical degree of development to be seen in the American Negro of today owes much to this terrible method of selection."

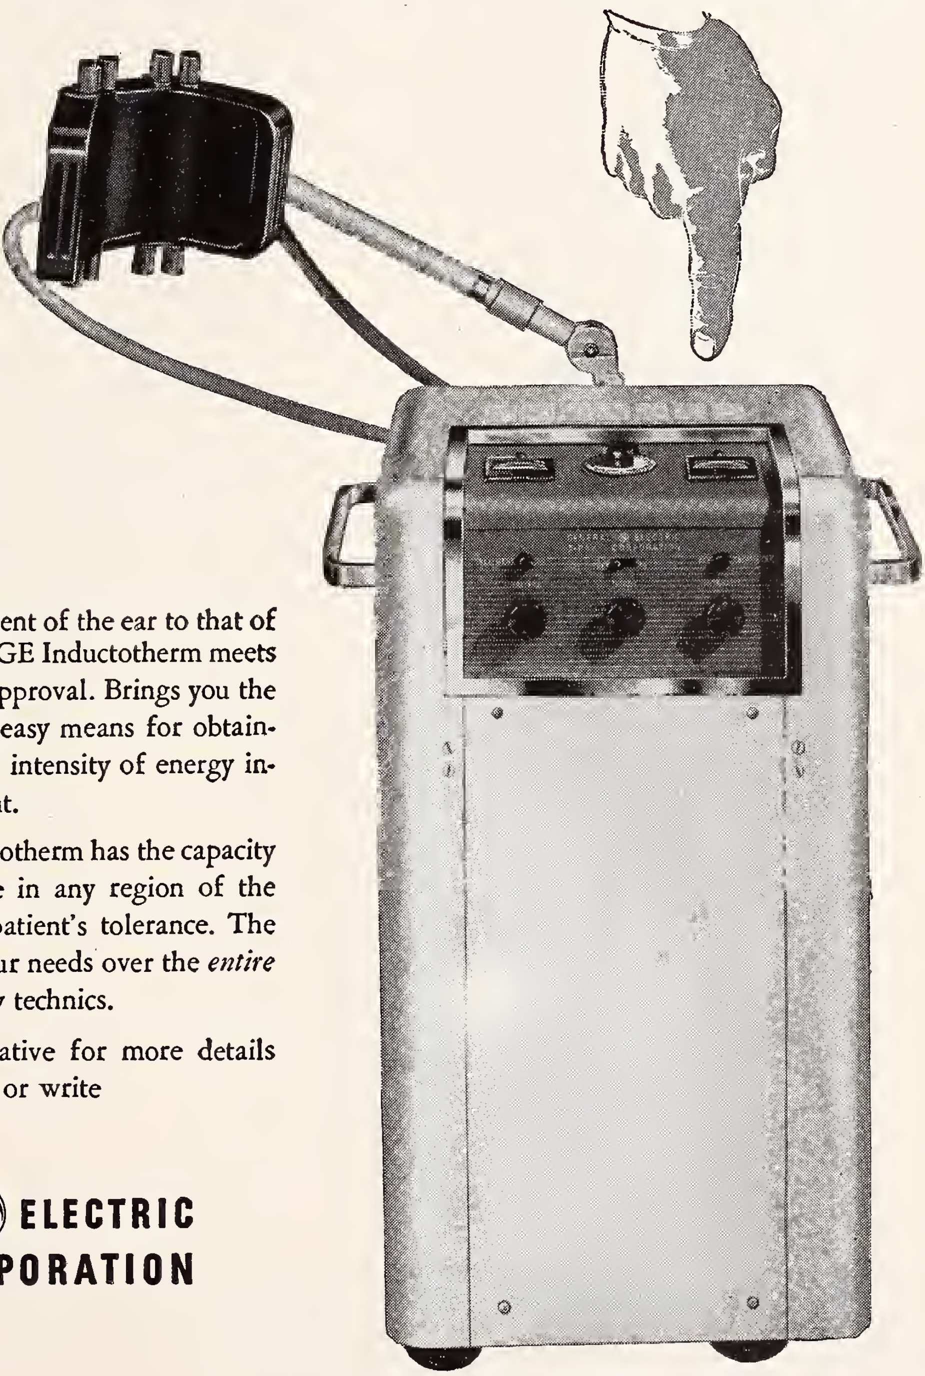
Dr. Goodman notes some similarities, however. The pelves of the native women in Africa are very small, he finds, 20 to 25 per cent smaller than the averages for English or white American women. This, he points out, is also true of more than 20 per cent of American Negro women. While the contracted pelvis occurs much more frequently as a racial characteristic in the black than in the white, he adds that operative delivery is much more frequently required among white women.

"Most European visitors to Accra are impressed by the small size of the pelvis and are astonished at the relative ease of delivery," he says. "Fortunately, our babies are small by English or American standards, but there is also little doubt that the fetal head can withstand extreme degrees of molding more easily than can the white baby."—*Briefs,* Vol. XIV, No. 6.

The school bell must ring each term for butcher and baker, for doctor and lawyer. He who does not constantly enrich his mind with new knowledge may find eventually that his capacity for forgetting will leave little of value behind. And no dog, however old, need ever say that he can learn no new tricks. The doctor, wherever his path may lie, can still emulate to some degree Chaucer's clerk of Oxenford, for "—gladly wolde he lerne, and gladly teche."—Editorial, *The New England J. Med.,* Nov. 9, 1950.

Meets every requirement for all diathermy technics...

the GE INDUCTOTHERM



FROM diathermy treatment of the ear to that of a pelvis or chest — the GE Inductotherm meets the most exacting clinical approval. Brings you the practical, the efficient, the easy means for obtaining the desired quality and intensity of energy indicated for proper treatment.

As for output, the Inductotherm has the capacity to elevate the temperature in any region of the body to the limit of the patient's tolerance. The perfect answer to fulfill your needs over the *entire range* of modern diathermy technics.

Ask your GE representative for more details about the Inductotherm — or write

In Memoriam

KARL DEDOLPH

Dr. Karl Dedolph was born in Saint Paul on May 15, 1887. He was the son of Dr. Fredrick Dedolph, an early member of the Ramsey County Medical Society, whose picture is still preserved in one of the early groups, namely 1889.

Doctor Dedolph's primary education was all accomplished in Germany, his father having sent him there for this training. He then returned and graduated from Mechanic Arts High School in 1905. He graduated from the University of Minnesota in medicine in 1911. He was a member of Alpha Kappa Kappa medical fraternity. From 1911 to 1912, he served as intern at Ancker Hospital. In 1913, he practiced medicine in Roberts, Wisconsin, but after six months there, he returned to Saint Paul and established himself at the corner of Snelling and Selby Avenues. He maintained his office there until the time of his death, June 8, 1950.

From October, 1913, to October, 1915, he served as City Physician under Dr. Ancker. During World War I, he served in the Medical Corps for one and one-half years at Fort Omaha and Camp Travis, San Antonio, Texas.

After the war, he returned to his Saint Paul office and carried on his general practice. He was associated with the Wilder Charities and did faithful service there for twenty-five years.

Doctor Dedolph was always closely associated with the Ramsey County Medical Foundation of Ramsey County and worked diligently to build up the fund. He was a faithful member of the staffs of St. Joseph's, St. Luke's and Miller Hospitals.

He was married in 1916 to Gwendolen Carter, who survives him. They had three children: Karl, who served three and one-half years overseas in World War II; Josephine, who is a graduate nurse from Miller Hospital and is married to Dr. E. F. Hill of Spring Valley, Wisconsin; and Carter, who is now serving with the Army Air Corps in Massachusetts. In addition to these children, he is also survived by three grandchildren.

Walter D. Brodie, M.D.

DAVID D. HILGER, M.D.

David D. Hilger was born April 25, 1877, at Henderson, Minnesota, and died November 12, 1950. In his early years he lived in Pierre, South Dakota. He attended St. Thomas College, Saint Paul, Minnesota, and entered the University of Minnesota Medical School in 1901, graduating in 1905. He interned at Ancker Hospital, Saint Paul, and practiced in Saint Paul thereafter. He was a member of the Ramsey County Medical Society and the Minnesota State Medical Association.

He is survived by five children—three sons, Dr. Jerome A. Hilger, Dr. Laurence D. Hilger of Saint Paul, and Dr. David William Hilger, Oakland, California, two daughters, Mrs. Russell Andre and Mrs. Richard Carley of Saint Paul, and three brothers, Dr. A. W. Hilger and Robert and John Hilger of Saint Paul.

During his long professional life in Saint Paul, Dr. Hilger was beloved by both his patients and his fellow physicians. Even though he retired from practice several years ago, he kept up his interest in his fellow men, and the community of Saint Paul has suffered in the irreparable loss from his death.

J. R. Meade, M.D.

MILO MARVIN LOUCKS

Dr. M. M. Loucks of Kelliher died suddenly of a heart attack on January 29, 1951, at the age of forty-eight.

Milo Marvin Loucks was born April 8, 1902, in South Dakota. He received his M.D. degree from the University of Minnesota. He was a member of the faculty of the medical school for six years and was in charge of x-ray and the laboratory department at the army hospital at Fort Cook. He practiced at one time in Alvarado. In 1937, he became associated with Dr. A. G. Chadbourn of Heron Lake and in 1943 moved to Northome. He had been located at Kelliher for the past five years.

Dr. Loucks is survived by his wife, Ruth; his mother, Mrs. A. Loucks of Trent, South Dakota, one brother, and four sisters.

GUSTAV SCHWYZER

Dr. Gustav Schwyzer, retired Minneapolis surgeon, died at Biloxi, Mississippi, February 2, 1951, at the age of eighty-three years. He was born in Zurich, Switzerland, March 5, 1867.

He obtained his medical education at the University of Geneva and Zurich, Switzerland, graduating in 1892. He had his postgraduate training under Prof. Theodore Kocher in Berne, Switzerland, where he served as first assistant for several years. He also served as an assistant to Otto Kappler.

He came to America and to Minnesota in 1898. He first practiced surgery in St. Cloud from 1898 to 1902 when he moved to Minneapolis. At the height of his professional career in 1931, he was forced into retirement because of a serious automobile accident. After retiring, Dr. Schwyzer lived at 10701 Lyndale Avenue South, in Bloomington, where he maintained a farm for many years.

While he operated occasionally in other hospitals, almost his entire time was spent at the Northwestern Hospital where he was Chief Surgeon until his retirement. During his active years of practice, he was one

Relationship of Stress to Autonomic Lability

Studies in psychosomatics have shown that functional disorders often are a result of the patient's inability to adjust to emotionally stressful situations (stressor factors).

Nervous tension and chronic anxiety, discharged through a labile Autonomic Nervous System, can cause somatic disturbance. [1,2] Such states may involve any one of the organ systems or several at one time. [1,3] The outline below is designed to relate gastrointestinal and cardiovascular symptomatology to the exaggerated response of the autonomic nervous system.

	Physiologic Effects of Autonomic Discharge	
	Sympathetic	**Parasympathetic**
Gastro-intestinal System	**Hypomotility Intestinal Atony Hyposecretion Reduced salivation**	**Hypermotility Gastrointestinal spasm Hypersecretion**
Cardio-vascular System	**Rapid heart rate Peripheral vaso-constriction**	**Slow heart rate Vasodilatation**
Functional Manifesta-tions	**Palpitation Tachycardia Elevated blood pressure Dry mouth and throat**	**Heartburn Nausea-vomiting Low blood pressure Colonic spasm**

The data here tabulated is from references [3,4,5,6,7], given below.

When the clinical picture is suggestive of functional disorder, the diagnosis is supported by the presence of the following indications of autonomic lability:

Variable Blood Pressure
Body Temperature Variations
Changing pulse rate
Deviations in B. M. R.
Exaggerated Cold Pressure Reflex
Oculo-Cardiac Reflex Abnormalities
Glucose Tolerance Alterations

Therapy in these cases is directed toward: 1) relieving the somatic disturbance to prepare the patient for psychotherapy*; 2) guidance in making adjustment to stressful situations and correction of unhealthy attitudes.

*Drug treatment using adrenergic and cholinergic blocking agents in conjunction with sedatives. [8,9,10]

GUSTAV SCHWYZER

(Continued from Page 260)

of the most distinguished surgeons in Minneapolis and the State of Minnesota.

Dr. Gustav Schwyzer married Mary Lowry in Minneapolis in 1903, who preceded him in death in 1923. She was the daughter of Thomas Lowry, a pioneer in the development of the Minneapolis Streetcar Company. One son, Warner, is residing in Texas. The late Dr. Arnold Schwyzer of St. Paul was his brother.

Dr. Schwyzer was an excellent general surgeon, but he was primarily interested in the surgery of the thyroid. He contributed many articles to the literature on this subject, about which he was considered an authority. In Halstad's "Operative Story of Goiter" his name is mentioned in the first successful operative cases reported by Kocher in 1898.

He was a charter member of the Minneapolis Club, a member of the Founders Group of the American College of Surgeons, Western Surgical Association, Minnesota Academy, and the American Medical Association, Minnesota State Medical Association, and Hennepin County Medical Society. Besides his association with the Northwestern Hospital, he was also Chief Surgeon for many years at the Minneapolis General Hospital, and surgeon for the Minneapolis Street Railway and Great Northern Railroad.

He was characterized by his attention to discipline and his enthusiasm for his professional work.

He is survived by his wife, the former Agnes Jorgens of Minneapolis, and one son, Werner, of Houston, Texas.

OTTO WILLIAM STERNER

Dr. Otto William Sterner died December 7, 1950, at the age of seventy-two.

Dr. Sterner was born in Sweden, October 1, 1878. He graduated from the University of Minnesota Medical School in 1903 and practiced in Cambridge, Minnesota, until 1915, at which time he moved to Saint Paul to practice with his brother, Dr. Ernest G. Sterner.

Surviving are his wife, Hildegard M., three sons and two daughters.

E. R. Sterner, M.D.

Over 25 million persons suffer from some disabling or nondisabling chronic ailment. Measured in any terms the chronic diseases are a staggering national burden, a major source of insecurity and of loss of national income. The most important of the chronic diseases are heart diseases, arteriosclerosis, high blood pressure, nervous and mental diseases, arthritis, kidney disease, tuberculosis, cancer, diabetes, and asthma. Although the incidence of chronic disease increases with age and the progressive aging of our population is one of the factors responsible for the growing importance of the problem, it is important to remember that chronic illness occurs at all ages.—Vlado A. Getting, M.D., Dr.P.H., *Am. J. Pub. Health*, October, 1950.

A DISTINGUISHED BAG

with a *Distinguishing* feature

"OPN-FLAP"

HYGEIA
MEDICAL BAGS

. . . it holds ⅓ more!

The famous patented "OPN-FLAP" feature, designed with the advice of physicians, permits opening of Hygeia Bag to the full length and width of top, thus allowing ⅓ more space for packing. Hygeia is the only medical bag that can be packed to the very top and easily zipped closed without crushing or jamming the contents. Made of the finest top grain leathers by luggage craftsmen, the "OPN-FLAP" Hygeia Medical Bag is preferred by doctors everywhere.

The University of Minnesota has become a brucellosis center for the United Nations World Health Organization. Selected because of its pioneering work on brucellosis, the University is the first of three such centers planned by WHO in the western hemisphere.

The center will be directed by Dr. Wesley W. Spink, professor of medicine, who is also president of the Inter-American Congress on Brucellosis. Dr. Spink and his co-workers have already gained wide recognition for their research work in the diagnosis and treatment of brucellosis in humans.

Similar centers will be established in Argentina and Mexico in the near future.

* * *

Dr. B. F. Fuller has opened offices at 755 Lowry Medical Arts Building, Saint Paul, for the practice of internal medicine and cardiovascular disease.

* * *

Dr. and Mrs. J. Donald Sjoding, Mankato, returned on January 27 from Miami Beach, Florida, where Dr. Sjoding attended the University of Florida midwinter seminar in ophthalmology and otolaryngology. He also attended the midwinter convention of the southern section of the American Laryngological, Rhinological and Otological Society.

* * *

At the annual meeting of the Upper Mississippi Medical Association in Brainerd on January 13, **Dr. Ralph D. Hanover** of Little Fork was elected president of the organization. The meeting was attended by members from eleven north central counties.

* * *

Dr. W. Robert Schmidt, a diplomate of the American Board of Surgery, has opened offices at 408 Physicians and Surgeons Building, Minneapolis, for the practice of thoracic and general surgery.

* * *

At last count the **Veterans Administration** had 114,256 operating beds, with 25,000 additional ones under construction or in the planning stage. Under the out-patient care program, home-town pharmacists filled 736,000 prescriptions last year, and more than 4,500,000 others were filled at VA pharmacies.

* * *

Head of the 1951 Easter Seal campaign in Kanabec County is **Dr. Willard F. Nordman** of Mora. He was named to the position by Frank M. Rarig, Jr., state chairman of the Minnesota Society for Crippled Children and Adults.

* * *

It has been announced that 98.3 per cent of the members of the **Colorado State Medical Society** paid their twenty-five-dollar membership dues to the AMA in time to have them included in a check sent to the national society by Harvey Sethman, executive secretary of the Colorado State Medical Society.

* * *

Dr. Gordon R. Kamman, Saint Paul, spoke on "Mental Health" at a meeting of the American Association of University Women at Albert Lea on February 5. More than 100 persons attended the meeting. On February 13, Dr. Kamman spoke at a meeting of the Cerro Gordo County Medical Society in Mason City, Iowa. His subject there was "Psychotherapy and Psychosomatics."

* * *

On February 1 it was announced that **Dr. Wallace E. Anderson,** Clearbrook, would maintain an office in the Clearwater Clinic at Bagley, starting immediately. It was stated that he would be at the clinic on week-day mornings.

* * *

Dr. Grant L. Griebie left Norwood on February 5 for service in the Army Medical Corps. Beginning service with the rank of captain, he left for Fort Lewis, Washington, where he expected to be stationed at Madigan General Hospital. Dr. Griebie moved to Norwood from Brownton in April, 1949, and was associated in practice with Dr. J. D. Selmo in the Norwood Clinic.

* * *

In the face of a critical shortage of nurses, the **American Nursing Association** has announced that about 40 per cent of registered nurses are not working at the profession and that there are 20 per cent fewer students enrolled in nursing schools than at the end of the war.

In all, there are 506,000 registered nurses—205,000 not practicing, although 87 per cent of these are married. About 100,000 students were enrolled in nursing schools in 1950, against 127,000 at the end of the war. The ANA, AMA and the Army are cooperating in a campaign to get older nurses who have retired to go back into practice, releasing the younger nurses for military duty. The Army needs 3,000 nurses by June.

* * *

The number of physicians in rural areas might be increased by accepting more medical students from such areas, **Dr. Harold S. Diehl,** dean of medical sciences at the University of Minnesota, suggested at a meeting in Chicago on February 12. Speaking at the forty-seventh annual Congress on Medical Education and Licensure, Dr. Diehl said that a survey of graduates of the University of Minnesota Medical School showed that the chances of a student brought up in a community of less than 5,000 returning to such an area are 2½ times as great as a metropolitan student going to the country.

Dr. Mentor H. Christensen and Miss Laura Mae Carpenter, of Minneapolis, were married in the Fort Snelling chapel on January 27. Dr. Christensen, formerly on the staff of the Minneapolis Veterans Hospital, has been recalled into service with the Air Force.

* * *

The Mineral Springs Sanatorium Commission announced on February 16 the appointment of **Dr. Ezra V. Bridge** as medical director and superintendent of Mineral Springs Sanatorium at Cannon Falls. He succeeds Dr. Karl H. Pfuetze as head of the sanatorium.

Dr. Bridge is a graduate of the Cornell University Medical College and has had extensive training in tuberculosis work. Before his appointment at Mineral Springs Sanatorium he was supervising tuberculosis physician at the J. N. Adam Memorial Hospital, Perrysburg, New York.

* * *

Principal speaker at a meeting of the Twin City Society of Medical Technologists in Saint Paul on January 10 was **Dr. John Rukavina,** who spoke on "Sickle Cell Anemia."

* * *

Dr. David A. Boyd, member of the section on neurology and psychiatry of the Mayo Clinic, Rochester, was a speaker on the program of the fifth annual Michigan Postgraduate Clinical Institute, held in Detroit on March 14, 15 and 16. Dr. Boyd spoke on "The Psychological Language of the Organs."

* * *

The newest member of the Minnesota Poll advisory board is **Dr. J. F. Norman,** Crookston, president of the Minnesota State Medical Association. Made up of twenty leading Minnesotans, the board is consulted by the Poll staff on issues to be studied in statewide public opinion surveys. The Minnesota Poll is conducted by the *Minneapolis Tribune* as a public service.

* * *

It was announced late in February that **Dr. F. H. Dickson,** of Proctor, planned to leave on March 15 by plane for a month's trip to Europe. His plans called for spending several days in England studying their socialized medicine arrangements, in preparation for writing and giving lectures upon his return home. He also planned to attend special medical clinics in London and Paris.

* * *

Dr. Edward Dyer Anderson, Minneapolis, was named a new director of the Minnesota Mental Hygiene Society on February 20. His term as a director extends until 1954.

* * *

Dr. Hewitt B. Hannah
Dr. Andrew J. Leemhuis.

YOUR *TOP LAYER* INCOME

TAXABLE INVESTMENT INCOME is your most expensive income since, under our progressive income tax system, it is this *"Top Layer"* income that pays the heaviest taxes.

There is little a taxpayer can do about his taxable income received from:

Professional Income
Salaries
Business Profits
Dividends from Business

These are main sources of revenues—your basic income. *"Top Layer"* income, however, your investment income, is something that you definitely have control over in that it is within your power to give such income either a "taxable" or a "tax-free" status.

The income from investments which is subject to taxation actually shrinks in yield whenever your professional income increases and forces this taxable *"Top Layer"* income into a higher bracket. In other words, the more your active earning power is increased, the greater percentage of your taxable investment income will be paid out in taxes.

Tax-free income is interest income on Municipal Bonds. This interest is exempt from all present Federal Income Taxes and consequently provides a *"Top Layer"* income that remains constant regardless of changes in other income or tax rates.

The two following examples clearly demonstrate the effect of Federal Income taxes on *"Top Layer"* income:

If you are in the $12,000-$14,000 individual income tax bracket and purchase an investment to yield 2.50% you will realize about 1.40% if the income is taxable but will receive the full 2.50% if it is not taxable.

If you are in the $20,000-$22,000 individual income tax bracket and purchase an investment to yield 2.50% you will realize about 1.10 % if the income is taxable but will receive the full 2.50% if it is not taxable.

We shall be pleased to send you information and descriptive circulars pertaining to municipal bonds that we have currently available for sale.

* * *

Dr. D. E. Affeldt was appointed village health officer at the annual meeting of the Kasson village council on January 2.

* * *

Dr. G. M. A. Fortier, of Little Falls, is head of the 1951 Easter Seal campaign in Morrison County.

After serving for thirteen years as Winona County physician, **Dr. C. P. Robbins,** Winona, notified the county board on January 2 that he would not be a candidate for the post in 1951. He stated that he would be unable to continue as county physician due to ill health.

* * *

Dr. William A. Coventry, Duluth, was honored for outstanding service to St. Mary's Hospital in Duluth at the annual meeting of the hospital's medical staff on February 1. He was presented with an engraved scroll expressing appreciation for his work. It was the second time in the hospital's history that such an award had been given. In 1947, Dr. E. L. Tuohy was the recipient of a similar award.

* * *

Dr. and Mrs. L. A. Dwinnell, formerly of Fergus Falls, have moved to Rochester, where Dr. Dwinnell has begun a three-year fellowship at the Mayo Clinic.

* * *

A University of Minnesota graduate, **Dr. Harold M. Graning,** has been appointed regional medical director of the public health service for Minnesota, Illinois, Indiana and Wisconsin. The appointment was the first step in a program to strengthen the regional setup of public health staffs. Dr. Graning, who was graduated from the University of Minnesota Medical School in 1937, has been with the public health service since 1938.

* * *

Dr. Willard C. Peterson, Minneapolis, discussed the everyday life of a physician at a meeting of the Macalester College Premedical and Dental Club in Saint Paul on February 13.

* * *

Among those in attendance at a continuation course in geriatrics at the University of Minnesota on January 4, 5 and 6 was **Dr. Hugh D. Patterson** of Slayton.

* * *

Early in January, **Dr. J. M. Cook** of Staples was appointed deputy coroner for Todd County by **Dr. A. J. Lenarz** of Browerville, who was elected coroner at the general election in November.

* * *

Dr. T. R. Fritsche, New Ulm, has been appointed medical officer on the state guard staff of General Russell B. Rathbun, Minneapolis. With the new appointment Dr. Fritsche became head of the medical staff of the units in all cities in which the new Minnesota State Guard is being organized.

* * *

Dr. Frederick A. Figi, consultant in the section on laryngology, oral and plastic surgery at the Mayo Clinic, Rochester, participated in a panel discussion on neck surgery and in a cancer symposium at the sectional meeting of the American College of Surgeons in St. Louis on January 22.

* * *

Dr. George D. Haggard, said to be Minnesota's oldest practicing physician, celebrated his ninety-fifth birthday in Minneapolis on January 18.

* * *

The resignation of **Dr. L. H. Flancher** as superintendent of the Sand Beach Sanatorium at Lake Park was accepted by the Clay-Becker county boards and the sanatorium commission on January 17. Dr. Flancher left on February 1 to become head of Sunnyrest Sanatorium at Crookston. He had been superintendent at the Sand Beach institution since 1925, except for eight years between 1941 and 1949 when

Storm Warning

MANY women see but do not identify the first disturbing signs of the menopause, and therefore reach their physicians' consulting rooms in double trouble—with anxiety superimposed upon the original symptoms.

At such times, especially, the physician needs an estrogenic product of recognized uniformity and potency—one which, like *dorestro* Estrogenic Substances, has proved its reliability through long compliance with the highest scientific standards, plus widespread clinical use.

When storm warnings are out and prompt action is indicated, *dorestro* will meet your requirements fully.

Dorestro Estrogenic Substances are packaged to provide ample choice of potencies in both oil and aqueous media.

he headed the tuberculosis department of the Iowa State Health Department.

* * *

Dr. Gerald N. Hofmann, staff member of the Mineral Springs Sanatorium, conducted a Mantoux testing clinic in Red Wing on February 5.

* * *

The first mental health clinic for children in Minneapolis was officially opened on February 9. The clinic, the **Washburn Memorial Clinic** at St. Barnabas Hospital, is believed to be the only one in the country sponsored jointly by a private hospital and a state university. **Dr. Harold B. Hanson,** director, was formerly director of the Minneapolis Board of Education's child study department.

Minnesota children up to sixteen years of age will be treated at the clinic on referral from other physicians. The clinic's staff will be supervised by faculty members of the University of Minnesota Medical School.

* * *

Dr. Thomas Page Anderson of the Mayo Foundation, has been appointed director of the Department of Physical Medicine at the new Medical Health Center at Ohio State University. Dr. Anderson has been a fellow in physical medicine at Rochester since January, 1948.

Dr. C. A. Rohrer of Waterville suffered a broken arm when another car collided with his on a highway near Morristown on January 26. Three other persons were also injured in the accident.

* * *

Word was received early in February that **Dr. John R. Utne,** formerly of Northfield, was in Korea with the First Cavalry Division of the Eighth Army. Dr. Utne was called into service in November, 1950.

* * *

Elmore lost one of its two physicians early in January when **Dr. Harry Shragg** left to begin work at the Minneapolis Veterans Hospital. Remaining in Elmore is Dr. Troy Rollins.

* * *

Dr. Philip S. Hench and **Dr. Edward C. Kendall,** Nobel Prize winners, were guests of honor at a formal reception held by the board of governors of the Mayo Clinic and the Mayo Foundation in Rochester on January 12. On display at the reception were the medals and diplomas presented the two winners by the Nobel Prize committee.

* * *

Dr. Charles W. Vandersluis, Bemidji, resigned as county coroner on January 3 after officially holding the position for only two days. The county board then appointed **Dr. Bernard S. Nauth,** Bemidji, to replace him. Backing Dr. Nauth's appointment, Dr. Vandersluis stated that he had resigned because of the press of duties from his practice and his position as city health officer. "The main reason I ran for the office," he said, "was because I am of the firm conviction that the office of county coroner is one for a doctor and not for an undertaker."

* * *

Dr. Leonard A. Lang, Minneapolis, was the principal speaker at a meeting of the St. Thomas College Aesculapian Club in Saint Paul on January 17.

* * *

Holiday Home at Lake Geneva, Wisconsin, will be open to eighty diabetic children, aged eight through fourteen, from June 25 to July 16. The camping period is sponsored by the **Chicago Diabetes Association.**

The need for such a camp in the Midwest was apparent in 1949 when Holiday Home provided the facilities to care for the younger diabetics and give them the advantage of summer camping. The contributions of such experience to the development of a normal child are obvious. A schedule of the usual camping activities is maintained under supervision of a trained medical, dietary, nursing and counseling staff. Included are swimming, handicrafts, nature study, boating, tennis and other pursuits which encourage the child in the direction of a normal balanced life. Association with other diabetics in this program gives the camper a feeling of group security difficult to achieve in the home.

Detailed medical analysis of the 1950 camping season, general information and applications are available on request. Inquiries should be sent to the Chicago Diabetes Association, Inc., 950 East 59th Street, Chicago 37, Illinois.

* * *

Dr. Ralph Wenzel, Blue Earth, announced early in January that he was moving to Columbus, Georgia, to start a private practice. Dr. Wenzel began practice in Blue Earth in 1948, in association with Dr. George Drexler, with whom he formed the Blue Earth Medical Center.

* * *

It was announced on February 7 that **Dr. Edward C. Kendall,** head of the Mayo Clinic's biochemistry laboratory and one of the winners of the 1950 Nobel Prize in medicine, will retire from the Mayo Foundation on May 1. It was stated that his future plans were indefinite but that he did not plan to cease working.

* * *

Dr. James J. Warner, of Perham, and Miss Mary Margaret Larson were married on February 6 at St. George's Episcopal Church in Minneapolis. They planned to spend their honeymoon in Hawaii.

* * *

Dr. A. H. Benson, formerly of Washington, D. C., announced on January 24 that he had taken over the practice of **Dr. R. V. Fait** in Little Falls. Dr. Fait, who has practiced in Little Falls since 1936, is moving to California to set up a practice.

A graduate of Loyola University, Dr. Benson practiced in northern Michigan for five years. For

1909 1951

WHERE ALCOHOLICS ACHIEVE INSPIRATION FOR RECOVERY

Where gracious living, a homelike atmosphere and understanding companionship contribute to successful rehabilitation.

200 acres on the shores of beautiful Lake Chisago

The methods of treatment used at the Hazelden Foundation are based on a true understanding of the problem of alcoholism. Among the founders of the nonprofit Hazelden Foundation are men who have recovered from alcoholism through the proved program of Alcoholics Anonymous and who know the problems of the alcoholic. All inquiries will be kept confidential.

HAZELDEN FOUNDATION

Lake Chisago, Center City, Minn. Telephone 83

the past five years he has specialized in genito-urinary diseases and surgery at Washington, D. C.

* * *

Dr. C. A. McKinlay, Minneapolis, showed color pictures of his recent trip to Europe at a meeting of the Hamline-Asbury Nurse Alumnae Association in Minneapolis on February 5. While in Europe, Dr. McKinley attended the annual congress of the International Cardiological Society in Paris.

* * *

Dr. L. E. Steiner, Albert Lea, was appointed deputy coroner of Freeborn County on January 3. Coroner for the county is **Dr. S. G. Egge.**

* * *

Dr. Wallace C. Hill moved from Pequot Lakes on January 12. Dr. Hill now has a fellowship in surgery at the University of Michigan at Ann Arbor, Michigan.

* * *

On December 29 **Dr. F. Donald Bucher** moved his offices into a newly constructed clinic building in Starbuck. The one-story, 30- by 50-foot building also houses a dental suite in addition to Dr. Bucher's offices.

* * *

Dr. R. S. Ylvisaker, Minneapolis, was re-elected president of the **Minneapolis War Memorial Blood Bank** at the annual meeting of the board on January 18. Other officers include **Dr. Nathaniel H. Lufkin, Dr. Thomas Lowry** and **Dr. Mancel T. Mitchell,** vice presidents.

At the meeting **Dr. G. Albin Matson,** director of the blood bank, reported that 11,827 units of blood were drawn from donors during the 1950 fiscal year. During the previous year the bank drew 8,823 units.

* * *

A diabetic survey began in Hibbing schools on January 29. Tests were run in school laboratories, with five teams of ten students each doing the work. The teams of high school and junior college students were supervised by **Dr. Rufus Johnston,** school health officer, and **Dr. Robert Murray,** township health officer. Plans called for testing about 4,500 students and school employes. A similar survey was completed for the adult population of Hibbing last year.

* * *

Dr. John B. Evensta, formerly of Minneapolis, has become associated in practice with Dr. Gordon M. Erskine and Dr. Clarence R. Ferrell of Grand Rapids. Dr. Evensta is specializing in surgery.

* * *

Dr. Kenneth W. Covey, Mahnomen, was named "Young Man of the Year" by the Mahnomen Junior Chamber of Commerce at their annual banquet on January 15. The award was presented to Dr. Covey because of his numerous contributions to civic and community life and his continued interest in the all-around progress of the community.

Dr. A. D. Hoidale, who retired from active practice in Tracy more than a year ago, resumed his practice on February 15. His return was caused by the shortage of physicians which resulted when two local doctors were called into military service.

It was announced on February 8 that Tracy would acquire another physician early in July. He is **Dr. Malcolm M. Fifield,** who is now completing a two-year fellowship at the Navy Hospital at Bremerton, Washington.

* * *

Dr. S. Marx White, Minneapolis, was presented with the annual distinguished service award of the Community Chest and Council of Hennepin County at its annual meeting in Minneapolis on January 31. Dr. White, who has practiced in Minneapolis for more than fifty years, has an impressive record of service in community health activities. He has been president of the Minnesota State Board of Health, a member of the Hennepin County Sanatorium Commission, a director of the Hennepin County Tuberculosis Association, and president of the Community Chest and Council. He was a member of the University of Minnesota Medical School faculty from 1898 to 1942.

* * *

Dr. Charles W. Mayo, Rochester, has been elected a regent of the University of Minnesota, replacing Mr. A. J. Lobb, business manager of the Mayo Clinic, who resigned in January upon reaching the Mayo Clinic retirement age. Dr. Mayo's election continues a thirty-eight-year-old tradition that has kept a representative of the clinic on the board of regents.

* * *

Dr. and Mrs. E. R. Bray, Saint Paul, left on February 23 for Hot Springs, Virginia, where Dr. Bray attended a meeting of the American College of Surgeons.

* * *

The fiftieth anniversary of the Minnesota chapter of **Alpha Epsilon Iota,** national medical sorority, was celebrated in Saint Paul on February 21. Chairman of arrangements for the anniversary was Dr. Catherine Corson West of Minneapolis.

* * *

The Triumph-Monterey Community Hospital received a gift of equipment early in February from **Dr. Robert C. Farrish** of Sherburn. The equipment included an emergency table, instrument cabinet and instruments. Construction of the new hospital is nearing completion.

* * *

The Austin Clinic announced on February 12 that **Dr. Harold J. Anderson,** formerly of Saint Paul, had joined the clinic staff. A graduate of the University of Minnesota Medical School in 1944, Dr. Anderson served his internship at Minneapolis General Hospital, then entered the Army for two years. Following his return to civilian life, he took specialized

training in surgery at Minneapolis General and the University of Minnesota Hospitals. His practice in Austin will be limited to surgery.

* * *

Among the speakers on the program of the **Hennepin County Health Day** in Minneapolis on January 26 were Dr. Tague C. Chisholm, Minneapolis pediatric surgeon; Dr. C. Knight Aldrich, professor of psychiatry at the University of Minnesota, and Dr. Edward L. Tuohy of Duluth.

* * *

On February 14 **Dr. A. E. Sohmer** of Mankato retired from active practice. A graduate of Brooklyn's Long Island College in 1899, Dr. Sohmer practiced in Buffalo, New York, until 1910, when he moved to Mankato. For five years he was a general practitioner in Mankato, and in 1916 he began to specialize in general and urological surgery.

Dr. Sohmer is a past president of the Blue Earth County Medical Society and the Southern Minnesota Medical Society, and a former vice president of the Minnesota State Medical Association.

* * *

A bronze plaque honoring **Dr. M. S. Henderson,** a retired staff member of the Mayo Clinic, was installed in St. Mary's Hospital, Rochester, early in January. The plaque honored Dr. Henderson for his work in organizing the hospital's orthopedic section.

* * *

Dr. Karl S. Klicka became the new medical director of St. Barnabas Hospital, Minneapolis, January 1, 1951. Dr. Klicka is a graduate of Western Reserve University medical school, Cleveland, Ohio, and took advanced training in hospital administration at the University of Chicago. He has been director of Woman's Hospital, New York, since his discharge from the Army in 1945.

* * *

Dr. E. J. Lillihei was elected chief-of-staff at St. Barnabas on February 7. Chosen as vice chief-of-staff was **Dr. Robert J. Tenner;** as secretary-treasurer, **Dr. Edgar A. Webb.** At the same time the appointment of Clarence N. Hardenbergh as chairman of the St. Barnabas board of directors was announced. Mr. Hardenbergh succeeds Charles Bolles Rogers as chairman.

BLUE CROSS—BLUE SHIELD NEWS

Payments to physicians for subscriber medical service by Blue Shield in 1951 were more than ten times as much as those of 1948, and twice those of 1949. In 1950 these payments amounted to $2,249,032; in 1949, $1,156,231; and in 1948, $169,269. The 1950 payments represented 58,568 claims for 70,893 services including all ancillary services.

For December 1950 alone, payments totalled $265,637.79 for 7,528 claims. This represents an increase of $63,788.16 over November. These payments covered 5,501 hospitalized cases, 1971 cases of care in the doctor's office or clinic, and 56 cases in which care was rendered in the patient's home. Subscribers with incomes over $2,000 or $3,000 annually, if single or married respectively, received the benefits in 5,499 claims, and 2029 claims of subscribers with incomes less than those mentioned were paid.

As a result of the sharp increase in the number of claims filed with and processed by Blue Shield, it has been found necessary to analyze the age of claims as filed. For instance, of the 7,528 claims processed in December, only 1,258 were for services in December, whereas 3,180 were for November services and 1,652 for October. Of those remaining 177 were over six months old and of these 20 were over a year old.

Delay in filing and paying claims is due to a variety of factors. From the administrative viewpoint, Medical Service Reports often do not contain enough information to evaluate and pay the claim; evidence that preexistence of the condition may invalidate the claim makes it necessary to secure previous medical history from both doctor and subscriber; and in some instances the subscriber fails to advise the doctor that he has a Blue Shield policy for several months after the service is provided. Since the doctor's office is the liaison between the patient and Blue Shield, in many cases the only means of personal contact, Blue Shield relies on this contact to assist wherever possible in seeing that claims are properly submitted.

The professional relations subject is not one which is under consideration only by Minnesota Blue Shield. From February 1 to 3, 1951 approximately 200 representatives of Blue Cross and Blue Shield plans throughout the nation attended a Blue Cross-Blue Shield Hospital and Physician Relations Conference, captioned "Prescription for Profitable Professional Relations." The general discussions and panel meetings centered about ways and means by which better professional relations could serve to improve the workings of both Blue Cross and Blue Shield. Questions pertaining to diagnostic studies, hospital admittances, home and office calls and the avoidance of the overuse of hospital ancillary services were the chief topics. There was also discussion about the desirability or advisability of forming an organization of medical directors of Blue Shield and Blue Cross which might possibly serve on an advisory basis to the Blue Cross-Blue Shield Commission. Suggestions made for better professional relations included the effective use of plaques in the doctor's office and possibly the hospital waiting rooms, improved means for assisting the patient to identify his Blue Cross-Blue Shield eligibility, and the use of stickers on hospital charts to prevent overstay.

SOCIALIZED MEDICINE CALLED ALIEN BLIGHT

(Continued from Page 248)

has an honored profession encountered such a difficult situation."

The list of barriers blocking the way in medicine's fight includes:

". . . the bureaucracy became its chief exponent. Since then, volumes of 'official' and inspired propaganda have been issued, mainly at public expense.

"Federal employes have served as exhorters and lobbyists.

"In the Department of Justice the antitrust laws have been distorted to persecute ethical medical societies.

"The whole weight of the federal government and the inexhaustible finances of the federal treasury, have been misused to destroy the freedom of medical practice and to put medical science under political control."

The newspaper called all these things "unscionable oppression," and applauded the medical profession for leading the opposition against them:

"Against this unscionable oppression—for it is nothing else—the medical profession has reacted COURAGEOUSLY and CONSTITUTIONALLY.

"The profession is exercising ITS OWN RIGHT OF PETITION by appealing to the American people—and so, to the Congress of the United States.

"The doctors are battling for FREEDOM, not for monetary gains.

"In every calling, as in every community, the fight against socialism must be made.

"The doctors are showing other Americans how to make it."

The total blind population now in the United States is believed to be over 260,000.—Christmas Seal Health Release.

BOOK REVIEWS

Books listed here become the property of the Ramsey, Hennepin and St. Louis County Medical Libraries when reviewed. Members, however, are urged to write reviews of any or every recent book which may be of interest to physicians.

PRACTICAL GYNECOLOGY. *Walter J. Reich,* M.D., F.A.C.S., F.I.C.S., Attending Gynecologist, Cook County Hospital; Professor of Gynecology, Cook County Graduate School of Medicine; Attending Gynecologist, Fantus Clinics of the Cook County Hospital; Assistant Professor of Gynecology, Chicago Medical School; Attending Gynecologist and Obstetrician, Grant Hospital; Attending Gynecologist, Fox River Tuberculosis Sanatorium; Consulting Gynecologist, Hazelcrest General Hospital; and *Mitchell J. Nechtow,* M.D.; Associate Attending Gynecologist, Cook County Hospital and the Fantus Gynecologic Clinic; Assistant Clinical Professor of Gynecology, Cook County Graduate School; Associate in Gynecology and Obstetrics, Chicago Medical School; Attending Gynecologist and Obstetrician, Norwegian-American Hospital. 449 Pages Illus. Price $10.00 Philadelphia: J. B. Lippincott, 1950.

"Practical Gynecology" was formulated from the authors' experiences in conducting classes at the Cook County Graduate School of Medicine and in the gynecologic out-patient clinics at the Cook County Hospital. The book was written to fulfill the needs of the general practitioner as a handy aid toward establishing a diagnosis, and utilizing practical procedures suitable to the office management of medical and minor surgical diseases in gynecology. The book is not concerned with major operative gynecological procedures, and if such information is desired one is referred to standard textbooks pertinent to the subject being discussed.

Busy practicing physicians are likely to hurry patients along, and in gynecology, as well as in all fields of medicine, a careful history and thorough physical examination are so essential at arriving at a proper diagnosis that one should take time to listen to patients. A timely remark by the authors which impressed me was that the patient "talks her story in her own words" and "we have made it a habit to be good listeners."

There are seventeen chapters: Psychosomatics of Gynecology, Practical Approach to a Gynecological Diagnosis, Biopsy and the Early Detection of Cancer, Laboratory Findings in Gynecology, Reproductive Endocrinology, Menstruation, Disturbances of Menstrual Function, Anomalies and Malposition of the Female Genitalia, Inflammatory Lesions, Infection, Traumatic Lesions, Neoplasms, Common Gynecological Complaints, Genital Fistulas, Technics and Apparatus, Low Fertility and Sterility, Premarital Examination and Counsel.

Comments regarding the material contained in the above chapters is not warranted, because the material contained therein is discussed in a fundamental, practical and useful manner. There are several sections in the book which are exceptionally worth-while. Drs. Reich and Nechtow, in the section on Psychosomatic Approach to Sexual Problems, have offered simple approaches to the solution of very personal problems. The last chapter on Premarital Examination and Counsel is one which

adds to the value of the book for its intended purpose.

Anyone practicing office gynecology, general practitioner or gynecologist, should read the paragraphs pertaining to vaginal pessaries—indications and method of application.

The title "Practical Gynecology" describes the book in the simplest of terms. It should be valuable to any physician who treats gynecological patients.

J. F. Melanco, M.D.

PROGRESS IN GYNECOLOGY. Volume II. Edited by Joe V. Meigs, M.D., Clinical Professor of Gynecology, Harvard Medical School; Chief of Staff of the Vincent Memorial Hospital, the Gynecological Service of the Massachusetts General Hospital; Surgeon, Pondville Hospital; Gynecologist, Palmer Memorial Hospital, and Somers H. Sturgis, M.D., Clinical Associate in Gynecology, Harvard Medical School; Assistant Surgeon, Massachusetts General Hospital, Boston, Massachusetts. 821 Pages. Price, $9.50. New York, Grune & Stratton, 1950.

In this volume, the editors, Joe Vincent Meigs, and Somer H. Sturgis, again as in Volume I, have asked contributors to write on specific subjects and have received an excellent response. In addition to their own contributions, they obtained material from scores of others and always from those who excel or are interested in one particular phase. In other words, they asked men to write on their hobbies and therefore the masterfully selected and arranged chapters could be termed a "Parade of Hobbies." And what a parade it is! The chapters are carefully arranged and also overlap in certain cases to cover a subject from different viewpoints. This is not repetition, but a very helpful way to impress and drive home points. The volume again is primarily intended for those limiting their field of practice and for residents, but much man be gleaned from it by general practitioners or those wishing to refresh their knowledge.

The book opens with an excellent chapter on Embryology as a setting, and then proceeds in Physiology, Diagnostic Methods, Functional Disorders, and a very understandable chapter on the Inter-relationship on Endocrine Glands. It then deals with a very interesting and hard problem of Sterility, Infections of the Genital Tract, Treatment of Benign and Malignant Growths, and the newer operative techniques for various difficult conditions. It closes with pre-operative and postoperative care. When the book is thoroughly perused, one gets a very clear and up-to-date refreshing on confronting problems. It is an excellent volume and indispensable to anyone interested in gynecology or wishing to be well posted on gynecological problems.

Joseph F. Bicek, M.D.

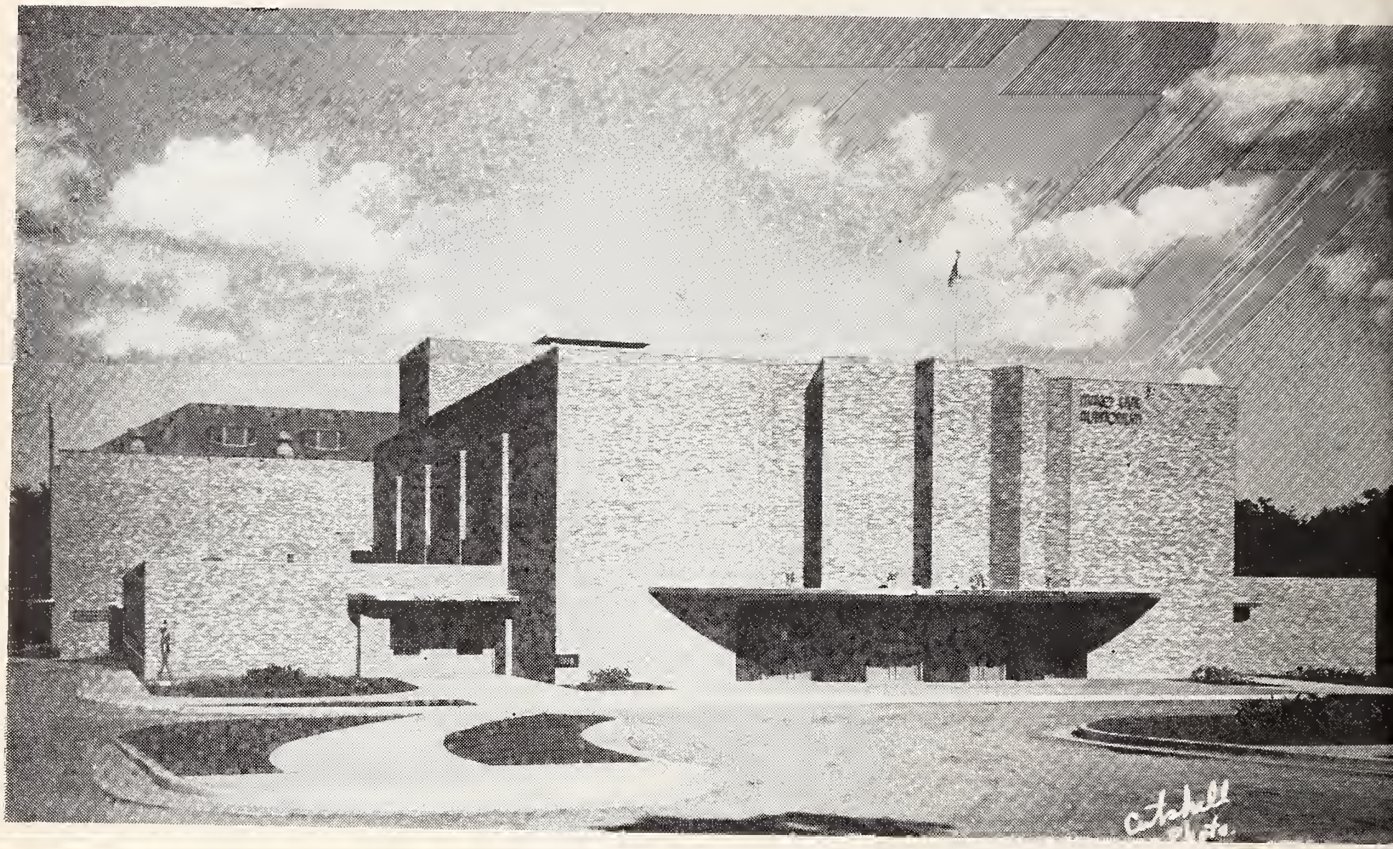
Welcome to Rochester

Minnesota State Medical Association

Ninety-eighth Annual Meeting, April 30, May 1 and 2, 1951

Rochester Is A City of Culture

MAYO CIVIC AUDITORIUM



Rochester is the home of the Mayo Civic Auditorium, erected in 1938 as a gift to the city from Dr. C. H. Mayo and the Mayo Association. Here the finest entertainment attractions, from stage and music to ice shows, are presented to the public. Rochester has its own Country Club, Tennis Club and University Club. It has a magnificent Public Library, and its own Art Center which not only contains the work of local artists but also exhibits the work of artists and craftsmen from various parts of the country. Visit Rochester's finest drug stores.

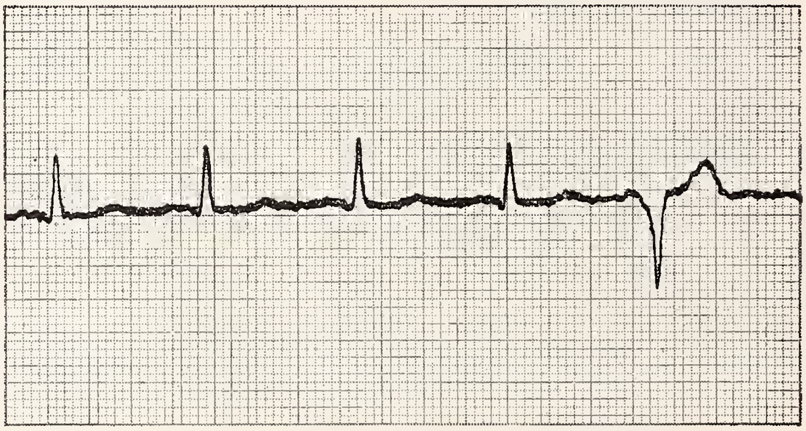
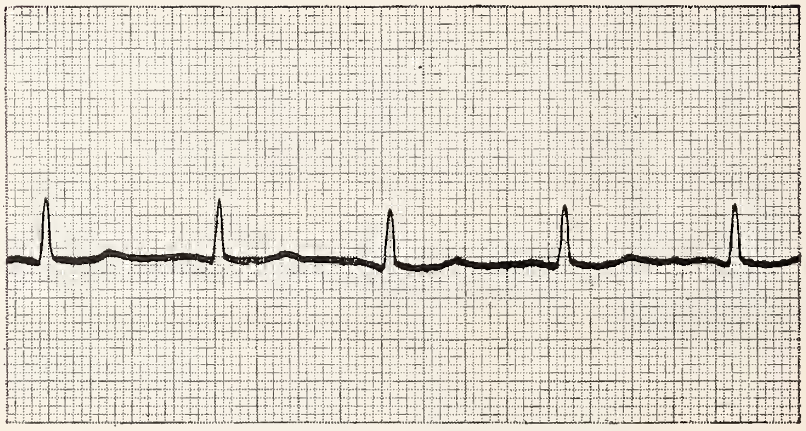
a significant advance in the treatment of ventricular arrhythmias . . . .

Oral PRONESTYL
in ventricular premature contractions



Lead I. Control tracing, ventricular premature contraction.



Lead I. Tracing one week later; patient maintained on 2 Gm. Pronestyl per day. Normal sinus rhythm.

....PRONESTYL *Hydrochloride*

less toxic than quinidine

Indications and Dosage

IN CONSCIOUS PATIENTS

For the treatment of ventricular tachycardia:

Orally: 1 Gm. (4 capsules) followed by 0.5-1.0 Gm. (2 to 4 capsules) every four to six hours as indicated.

Intravenously: 200-1000 mg. (2 to 10 cc.). *Caution*—administer no more than 200 mg. (2 cc.) per minute.

Hypotension may occur during intravenous use in conscious patients. As a precautionary measure, administer at a rate no greater than 200 mg. (2 cc.) per minute to a total of no more than 1 Gm. Electrocardiographic tracings should be made during injection so that injection may be discontinued when tachycardia is interrupted. Blood pressure recordings should be made frequently during injection. *If marked hypotension occurs, rate of injection should be slowed or stopped.*

For the treatment of runs of ventricular extrasystoles:

Orally: 0.5 Gm. (2 capsules) every four to six hours as indicated.

IN ANESTHESIA

During anesthesia, to correct ventricular arrhythmias:

Intravenously: 100-500 mg. (1 to 5 cc.). *Caution*—administer no more than 200 mg. (2 cc.) per minute.

Supply

Pronestyl Hydrochloride Capsules, 0.25 Gm., bottles of 100 and 1000.
Pronestyl Hydrochloride Solution, 100 mg. per cc., 10 cc. vials.

PRONESTYL *Hydrochloride*

SQUIBB PROCAINE AMIDE HYDROCHLORIDE

"PRONESTYL" IS A TRADEMARK OF E. R. SQUIBB & SONS

SQUIBB

"Nowhere in medicine are more dramatic therapeutic effects obtained than those which follow estrogen therapy in the girl who has failed to develop sexually. A daily dose of 2.5 to 3.75 mg. of 'Premarin' given in a cyclic fashion for several months may bring about striking adolescent changes in these individuals."*

"PREMARIN"®

Estrogenic Substances (water-soluble) also known as Conjugated Estrogens (equine).

"Premarin"—a naturally occurring conjugated estrogen—long a choice of physicians treating the climacteric—has been earning further clinical acclaim as replacement therapy in hypogenitalism.

In the treatment of hypogenitalism, the aim of "Premarin" therapy is to develop the reproductive and accessory sex organs to a state compatible with normal function.

Four potencies of "Premarin" permit flexibility of dosage: 2.5 mg., 1.25 mg., 0.625 mg., and 0.3 mg. tablets; also in liquid form, 0.625 mg. in each 4 cc. (1 teaspoonful).

"Premarin" contains estrone sulfate plus the sulfates of equilin, equilenin, β-estradiol and β-dihydroequilenin. Other α- and β-estrogenic "diols" are also present in varying amounts as water-soluble conjugates.

CAMP ANATOMICAL SUPPORTS for ORTHOPEDIC CONDITIONS

Whether it be relief from lesser degrees of postural or occupational strain, or as an aid in treatment following injury or operation, the Camp group of scientifically designed orthopedic supports for men, women and children will be found "comprehensive." Sacro-iliac, Lumbosacral and Dorso-lumbar supports may be prescribed for all types of build. The Camp system of construction fits the support accurately and firmly about the major part of the bony pelvis as a base for support. The unique system of adjustment permits the maximum in comfort. Physicians may rely on the Camp-trained fitter for the precise execution of all instructions.

If you do not have a copy of the Camp "Reference Book for Physicians and Surgeons", it will be sent on request.

When Lactation Fails

℞ LACTOGEN®

When the supply of breast milk is inadequate or when lactation fails entirely, there is no better formula than Lactogen. Designed to resemble mother's milk, it consists of whole cow's milk modified with milk fat and milk sugar. It differs, however, in one important respect: the protein content of Lactogen in normal dilution is one-third greater than that of mother's milk—2.0% instead of 1.5%.

A Complete Infant Formula In One Package

Lactogen contains all the ingredients of a well-balanced infant formula. In addition, it is fortified with iron to compensate for the deficiency of this mineral in milk.

Easily Prepared . . . Merely Add Water

Lactogen is simple to use. The prescribed amount is stirred into warm, previously boiled water. Either a single feeding can be prepared, or the entire day's quantity can be made up and stored in the refrigerator until used.

NEW DRAPING METHOD

with moisture-proof, adhesive-held plastic film

"SCOTCH" Surgical Drapes

Made of a thin plastic sheeting with a border of special adhesive; adhere to the skin on contact. Maintain a fixed sterile field. Form an impermeable barrier against contamination. Give surgeon an unencumbered working area. Give no wound edge irritation. Are quickly applied to the most difficult areas.

. . . are less irritating

Extensive pharmacological studies over a period of years have shown that the new adhesive developed for use on "SCOTCH" Brand Surgical Drapes as well as the plastic film used give considerably less skin irritation than any surgical tape tested. Clinical trials showed no evidence of wound edge irritation.

. . . for ease in draping

For the first time, here are surgical drapes made of a soft draping plastic film that conforms easily to irregular body contours. They are securely held in place by a strip of special pressure-sensitive adhesive that holds tight and yet is easy to remove. The drapes are non-toxic and unaffected by surgical solutions. They are sterile and ready for immediate use. By a special method of packaging they can be removed and applied without danger of contamination.

FOUR TYPES . . .

for **all** operative techniques

1. Towel Drapes measure 8″ x 16″ with a strip of adhesive along one side.
2. Treatment Drapes are 14½″ x 16″ with a 2½″ circular opening in the center. Adhesive surrounds opening.
3. Eye Drapes are 32″ x 50″—large enough to cover patient's head. Each has a 3″ x 2″ adhesive bordered opening.
4. Perineal Drapes are 16″ x 25½″ with strip of adhesive on one end.

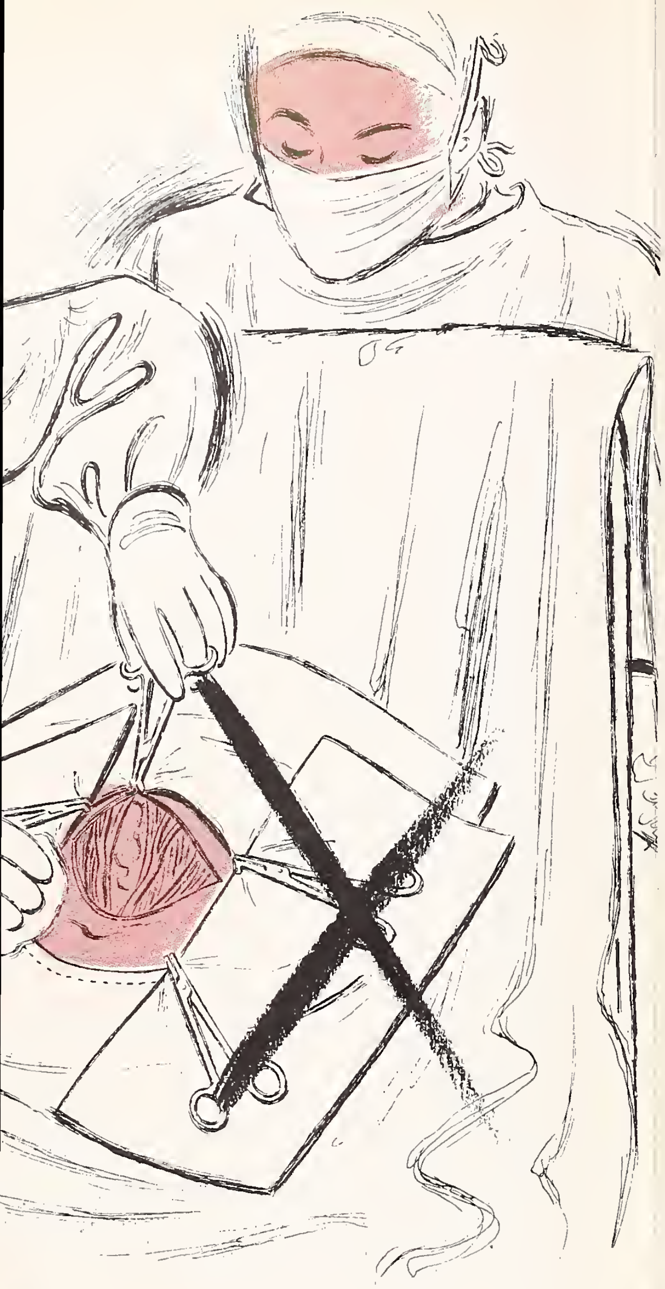
AVAILABLE FROM YOUR
SURGICAL SUPPLY DEALER

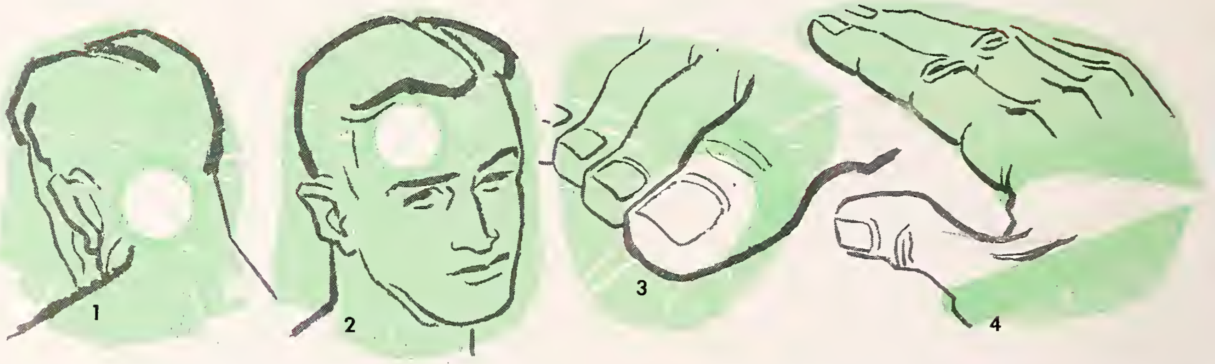


eliminates towel clips,
towel sutures,
towel bulkiness

Conventional Drapes

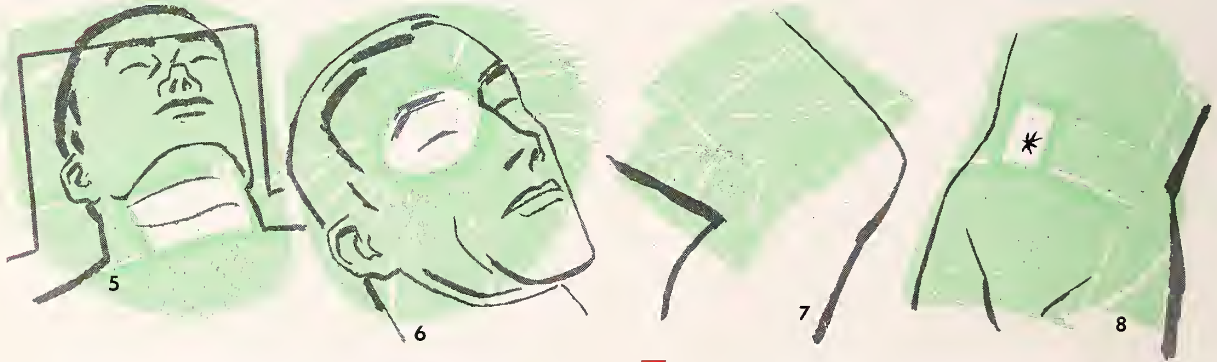
Insecurely held in place • Easily contaminated • Must be laundered and sterilized • Require towel clips or suturing—a source of discomfort to patient and possible source of secondary infection • Frequently restrict surgeon's movements • Not available without sterilization facilities and trained personnel • Extremely difficult to apply on irregular areas.

Uses of
"SCOTCH" SURGICAL DRAPES
in difficult-to-drape areas



1. Treatment Drape is an aid in removal of boils, wens, moles. Helps prevent infection.
2. Treatment Drape isolates operative site for repair of lacerations.
3. Toes and other extremities are effectively draped with Treatment Drape. Positive asepsis is maintained.
4. Towel Drapes may be used to demarcate a site of almost any angular shape. Difficult areas may be draped effectively.

ALSO FOR: Any emergency surgery or treatment where sterilization facilities are not available, such as in accident cases or home deliveries.



5. Three Towel Drapes and one Perineal Drape are employed in draping for thyroidectomy.
6. The Eye Drape holds firmly around orbital area.
7. "SCOTCH" Surgical Drapes may be folded over wounds as moisture-proof dressings.
8. Towel Drapes employed in masking off ileostomy.

ALSO FOR: Surgery of the female genital tract, breast, gastro-intestinal tract, herniorrpaphy, vein ligation, cholecystectomy, neurosurgery.

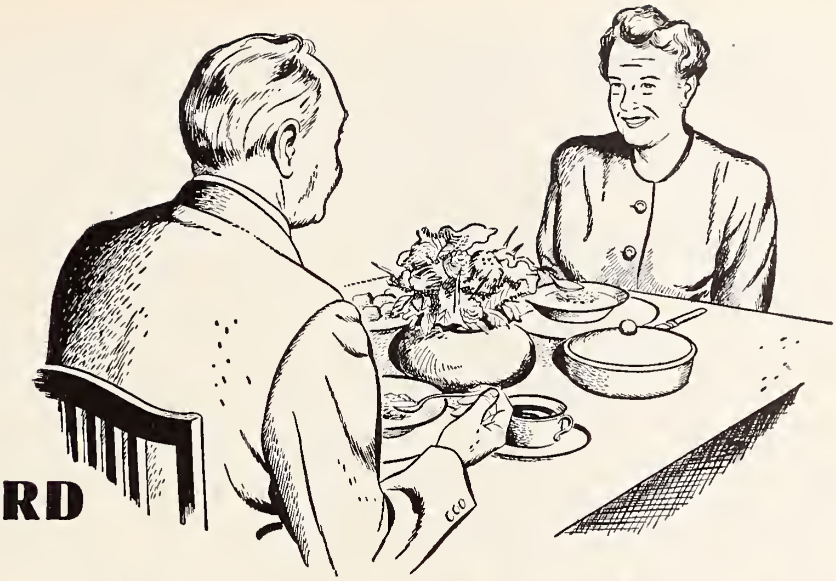
IN THE AIM TOWARD



Lessening Illness in the Aged

By maintaining complete adequacy of the diet during advancing years, considerable can be accomplished in reducing the frequency of illness in the aged population and in favorably influencing the mental state of the geriatric patient. In particular, ample intake of protein, vitamins, and minerals is needed for preventing many somatic and psychic symptoms of malnutrition often observed in the aged.[1]

The dietary supplement, Ovaltine in milk, is a reliable aid for supporting the nutritional state of the elderly patient. This nutritious beverage richly provides biologically complete protein, minerals—especially calcium and iron—and all the vitamins considered essential. Used in the recommended amount, it can readily supplement even poor diets to full nutrient adequacy. It is easily digestible, invigorating, and pleasingly palatable.

Note the wealth of nutrients furnished by Ovaltine in milk, as shown by the table given below.

---

Surprise!
IT'S THE NEW, BETTER-TASTING

Nembutal® ELIXIR

(PENTOBARBITAL, ABBOTT)

Here's a short-acting sedative in liquid form that patients old and young can take without difficulty. It's the new, improved Nembutal Elixir—tops in taste, odor, color and miscibility. • The new Nembutal Elixir is not a delectable treat, of course, but considering that it contains a bitter-tasting drug, it is palatable indeed. Use of Sucaryl® Sodium, Abbott's non-caloric, heat-stable sweetener, in place of much of the sugar helped to improve the taste. • The new Nembutal Elixir is much less viscous than the old, making it readily miscible with other medication. It also has a wide range of compatibility, including a number of other drugs, infant's formula and whole milk, and it remains stable even when heated. • The new Nembutal Elixir is available in 1-pint shelf-saving and 1-gallon bottles, each teaspoonful representing 15 mg. (¼ gr.) of short-acting Nembutal Sodium. Other products in the Nembutal line include capsules, suppositories, tablets, solutions and sterile powder for solutions. Handy small-dosage sizes simplify administration. Abbott

REMEMBER: In equal oral doses, no other barbiturate combines QUICKER, BRIEFER, MORE PROFOUND EFFECT than NEMBUTAL.

★ *Epileptic Men of Genius* ★

The Dutch painter, Vincent Van Gogh, one of the masters of Post-Impressionism, suffered from the psychic equivalent type of epilepsy. During one of his many periods of confusion he cut off one of his ears and presented it to a lady friend.

Comparative studies have shown that in some cases better control of grand mal as well as petit mal seizures can be obtained with Mebaral than with corresponding doses of other antiepileptic drugs. Mebaral produces tranquillity with little or no drowsiness. It is particularly desirable not only in epilepsy but also in the management of anxiety states and other neuroses. The fact that Mebaral is almost tasteless simplifies its administration to children. Average dose for children ½ to 3 grains, adults 3 to 6 grains daily. Tablets ½, 1½ and 3 grains.

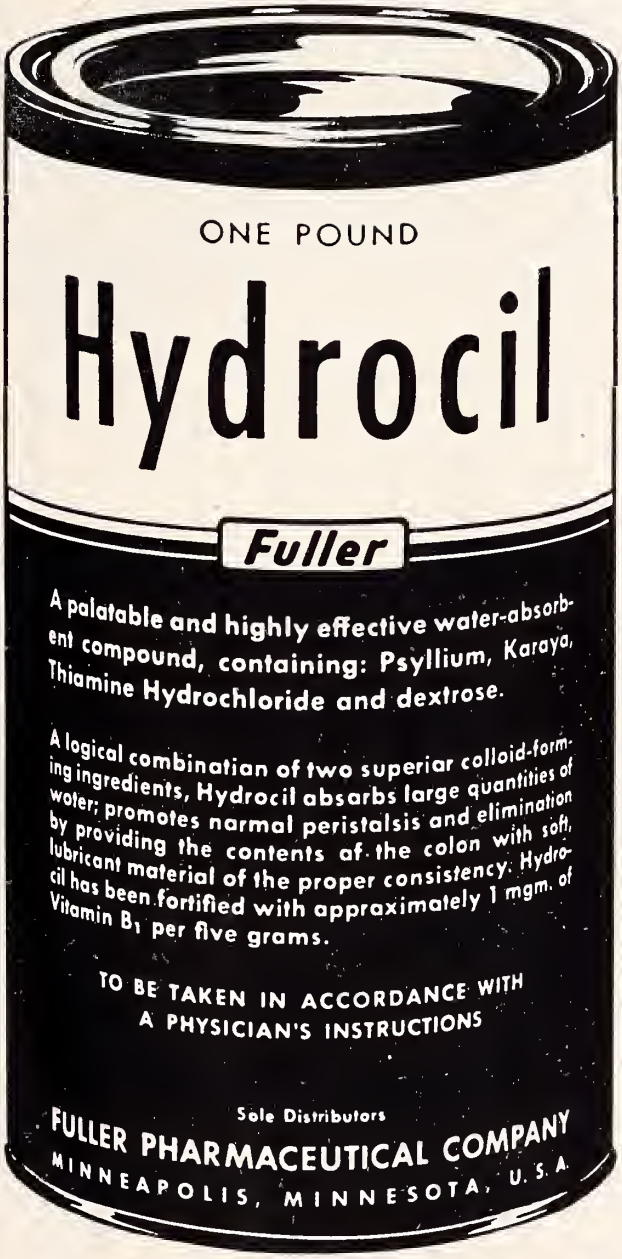
for constipation . . .



ONE POUND
Hydrocil
Fuller
A palatable and highly effective water-absorbent compound, containing: Psyllium, Karaya, Thiamine Hydrochloride and dextrose.
A logical combination of two superior colloid-forming ingredients, Hydrocil absorbs large quantities of water; promotes normal peristalsis and elimination by providing the contents of the colon with soft, lubricant material of the proper consistency. Hydrocil has been fortified with approximately 1 mgm. of Vitamin B1 per five grams.
TO BE TAKEN IN ACCORDANCE WITH A PHYSICIAN'S INSTRUCTIONS
Sole Distributors
FULLER PHARMACEUTICAL COMPANY
MINNEAPOLIS, MINNESOTA, U. S. A.

Hydrocil is ideal for daily use. It is pleasant to take, and it contains ample amounts of thiamine in each dose. Each gram produces 30 grams of moist, lubricating bulk.

WHETHER THE REASONS ARE PHYSICAL OR PSYCHOLOGIC..

Ramses
VAGINAL JELLY
VAGINAL JELLY
ACCEPTED
COUNCIL ON PHARMACY AND CHEMISTRY
AMERICAN MEDICAL ASSOCIATION

When for a physical or psychologic reason, the physician decides to depend on a spermatocidal jelly to protect the patient, he cannot do better than prescribe the "RAMSES"* Vaginal Jelly† Set No. 3.

Used as directed, the plastic applicator deposits 5 cc. of "RAMSES" Vaginal Jelly over the cervical os.

The cohesive and adherent properties of "RAMSES" Vaginal Jelly are of such high degree that the cervix remains occluded for as long as ten hours after coitus. "RAMSES" Vaginal Jelly, with its adjusted melting point, is not excessively lubricating or liquefying. "RAMSES" Vaginal Jelly exceeds the minimum spermatocidal requirement of the Council on Pharmacy and Chemistry of the American Medical Association.

AVAILABLE in a regular 3-ounce tube and an economy-size 5-ounce tube.

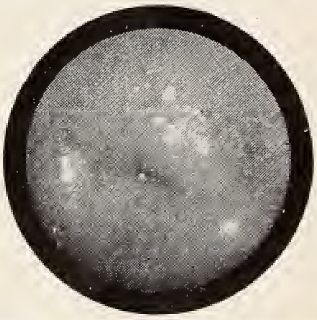

Photo taken after insertion of "RAMSES" Vaginal Jelly. Os occluded.

Photo taken ten hours after coitus. Occlusion still manifest.

Jelly stained with nonspermatacidal concentration of methylene blue for photographic purposes.

Improvement

Crude as it now appears, the equipment which Colonel Eli Lilly devised for coating gelatin capsules seventy-five years ago was a decided improvement over earlier hand methods. Soon this machine which impaled pills on needle points was abandoned for a still better procedure which left the coatings intact. Again, another step forward was taken a few years later when Eli Lilly and Company started making the now well-known empty gelatin capsules. Better materials, faster machines, lower costs continue to result from current research in medicinal coatings at the Lilly Laboratories. This is just one more example of how American industry makes progress when it is encouraged by the rewards from improvement and is spurred by competition in a system of free enterprise.

PATHOLOGY OF IONIZING RADIATION

BRIG. GENERAL ELBERT DE COURSEY, MC, USA
Washington, D. C.

THE DETONATION of an atomic bomb produces rays that cover the entire length of the spectrum. The intensity of the thermal radiation was so great in Nagasaki that there were flash burns on such diverse substances as wood, oranges, tile, and textiles. Thin objects such as leaves, blades of grass, and clothing acted as filters, offering protection in their shadows. This circumstance influenced the distribution and severity of burns sustained by the inhabitants of this city.

Ionizing radiation, the agent which makes the atomic bomb unique among all other weapons, also contributed to the morbidity and mortality among the population. Thousands of persons received radiation, but because of varying distances from the source and shielding of all different kinds, the amount varied from minimal to several times the lethal dose. The radiation was immediate and lasted for only a very few minutes.

The content of this paper represents the work of many investigators, American and Japanese. Tissues from those who died from the effects of atomic bombing before late September, 1945, were collected by the Japanese before we arrived. Many physicians in the Armed Forces participated in the collection of clinical material, and pathologic investigation was carried out by Dr. Liebow of Yale at Hiroshima and Captain Shields Warren and me, Navy and Army, who worked together at Nagasaki.[1] Most of the gross descriptions of early cases are the work of Japanese pathologists, but preserved organs and tissues for histologic studies were available to us. We performed autopsies after our arrival.

In reviewing what is known of the effects of radiation on the systems of the body the relationship of lesions to time of death must be considered. In patients dying during the first two weeks after exposure, there is histologic evidence of radiation effects in the bone marrow, gonads, gastrointestinal tract, and skin, which, however, are not manifested clinically. In the groups dying from the third to sixth weeks, bone marrow changes predominate and neutropenic ulcerations and hemorrhagic symptoms are spectacular. General nutrition declines. Gross changes are at about their peak. In those dying in the third and fourth months, beginning recovery in bone marrow and regeneration of hair are apparent, but testicular and connective tissue changes persist. There is increased emaciation. Malnutrition, however, is not based entirely on shortages of food; intestinal lesions and other factors are largely responsible.

Bone Marrow

The cellular picture of irradiated bone marrow is tremendously changed during the first week after the bomb explosion. There is almost total depletion of blood-forming elements, with the exception of small islands of erythropoiesis. By the end of the week reticulum begins to proliferate and at first differentiates into lymphocytes and plasma cells rather than myeloid cells. These forms predominate until the fourth week when myeloid differentiation is seen. The bone marrow of most of those dying before six weeks is hypoplastic; but in a few, islands of hyperplasia with arrest of maturation are observed. Most of the fatal cases of the third and fourth months show hyperplasia, which in the femur is grossly evident as pink marrow extending through a third or half of the shaft; in these the maturation defect decreases and more neutrophils are found in the peripheral blood and in infected tissues. In a few of the cases of longer duration, however, aplasia is prominent, with the marrow of the femur pink and gelatinous. Some marrows which grossly appear hyperplastic are really hypoplastic, the pink color coming from dilated blood vessels. Whatever the marrow picture, there is usually profound leukopenia at some time in fatal cases.

Lymph Nodes

The high degree of sensitivity of lymphoid tissue to ionizing radiation results in tremendous atrophy seen as early as the third day. Lymphocytes almost disappear, leaving a lacy framework that is spectacular in microscopic preparations. Necrobiosis may account for changes in the germinal centers, but departure from the normal architecture is marked only when the germinal centers disappear as they did in three-fourths of those who died during the first two weeks. The gross appearance of human lymph nodes very soon after the blast is not known, but in bombed animals the nodes are somewhat enlarged, soft, and pale in color. The large atypical mononuclear cells which appear by the second week have been considered lymphoblasts by one observer, but could logically be pathologic forms whose sensitive nuclear chromatin was deformed by the radiation. The lymph nodes from Japanese patients dying about the fifth week are usually large and almost devoid of lymphocytes and germinal centers. Bizarre large cells are more numerous. Plasma cells, eosinophils, mast cells, and increased numbers of reticulum cells are present. In the fourth month lymphocytes are more numerous but are still reduced.

Spleen

The lymphoid elements in the spleen react to radiation as do those in the nodes. Early, the spleen is usually small, but an occasional one reacts very promptly by swelling. On section it is dark red and pulp adheres to the knife; the follicles are indistinct and the trabeculae are somewhat prominent. In addition to the near absence of lymphocytes, large mononuclears are increased and there are erythrophagocytosis and hemosiderin deposits. During the second month the spleen is small and organized follicles are absent. A syncytial reticulum seems to surround the regenerating follicles in which the slight lymphocytic content of the organ is obvious. Atypical large mononuclears are found in about 25 per cent of the material examined. Through the fourth month there is still moderate atrophy; occasional germinal centers appear and the lymphocytic content shows some evidence of recovery.

Secondary Effects of Radiation on Reticulo-Endothelial Descendants

Hemorrhagic lesions and leukopenic necrosis represent the principal effects on the irradiated body about the end of the first month. Leukopenia was extreme in affected Japanese.[2] The pharynx and its connections, the gastrointestinal tract, the respiratory organs and the skin manifest both changes. In addition, petechiae, purpuric patches, or large ecchymoses are seen in other soft tissues, particularly the urinary tract, mesothelial linings, and muscles. These changes are outstanding clinically, and their severity depends on the location of the larger hemorrhagic lesions. Hemorrhages in the linings of the pharyngeal regions, the bowel, or the urinary tract give signs externally. Hemorrhages breaking through epithelium of bacteria-laden surfaces often initiate neutropenic necrotizing lesions, which in the pharynx are similar to the well-known acute agranulocytosis. Ulcers sometimes extend onto the tongue, the gums, buccal membranes, lips, and even the skin, to give the picture of noma. Such ulceration may also be independent of hemorrhage. It is probable that ordinarily nonpathogenic bacteria may cause serious consequences after sufficient reticulo-endothelial reserves are lost. Most ulcerative lesions throughout the stomach and intestinal tract are on a similar basis.

Lungs

Only the slight edema, perivascular or pleural, that appears in the lungs in the first two weeks might be a primary radiation effect. Hemorrhagic and necrotizing pneumonia are common after the first few weeks as secondary lesions, and are probably part of the process which results in ulcerative lesions of the gastrointestinal tract.

Gastrointestinal Tract

This tract is among the first in which lesions are grossly visible. Even before hemorrhagic manifestations, the ileum or cecum, particularly, may present focal changes characterized by swelling, greenish and yellowish-grey coloration, and induration of the mucosa. These foci may become confluent and widespread, with a diphtheritic membranous effect and much submucosal edema. Later, mucosal hemorrhage may initiate another cycle of similiar change in the stomach or intestine, beginning with ulceration of the mucosa at the site of the hemorrhage and progressing to an ulcerative or pseudomembranous process. In the small intestines initially only the tips of the folds may be involved, giving the appearance of having been dipped into boiling water; later, they become greenish or yellowish-grey.

Again in the third and fourth months, enteritis, most often in the large intestine but sometimes affecting also the small intestine or occasionally the stomach, may be the most prominent lesion at autopsy. The large intestine at this stage is usually the seat of a widespread process that may extend from the ileocecal valve to the rectum, the involvement being most prominent in the distal portion. Thickening of the wall is a feature. A diphtheritic membrane and ulceration are sometimes present to give a pathologic picture resembling that of bacillary dysentery. It would seem that the process represents not only changes due to irradiation of the sensitive intestine, but also those resulting from decreased resistance to omnipresent intestinal microörganisms and, probably more important, lowered antibiotic capabilities of the blood.

Microscopically, the epithelium early contains extremely bizarre cells with giant hyperchromatic nuclei and multipolar mitoses. The swelling is seen to be caused by edema, and the peculiar coloration by the absence of infiltrating leukocytes. In the late stages prominent features are areas of mucosal ulceration with much fibrinous exudate, few leukocytes, and in the remarkably edematous submucosa a considerable number of histiocytes, a few lymphocytes, and occasional eosinophils. Plasma cells of the lamina propria remain numerous.

Testes

The testes show intense changes in almost every instance. As early as the fourth day when the parenchyma has a normal appearance grossly, the histologic sections exhibit remarkable evidence of damage to the germinal epithelium, numerous cells of which are necrotic and free in the tubules, some having been carried into the rete testis. The number of mitoses is small. Sertoli cells begin to increase in number. Mature spermatozoa are found even in later specimens where spermatogenesis has ceased. Apparently uninjured spermatozoa appear in the seminal vesicles.

During the second month gross examination reveals little. Histologically, a few necrotic germ cells remain, but most have disappeared, and phagocytic or infiltrating inflammatory cell activity is absent. A few bizarre cells approximating the basal membrane appear to be spermatogonia. Sertoli cells are more numerous. The tubules now begin to shrink, and at this time the interstitial cells of Leydig are so prominent that some interpreters regard them as hyperplastic. The most extreme vascular change in any part of the body is seen in some of the small interstitial vessels; beneath the distinct thin endothelium is an eccentrically located mass of eosinophilic homogeneous refractile material that may almost occlude the lumen. This change, difficult to ascribe to radiation, is often best seen near the tunica albuginea and apparently persists, for it is present in autopsy material from the third and fourth months. At that time the interstitial tissue is somewhat less prominent; the basement membranes are thick, wavy, and acellular; the tubules, now more atrophic, are often hyalinized. Elsewhere Sertoli cells have replaced the germ cells, which have become rare. Before attributing these changes entirely to radiation, one must give consideration to the poor state of nourishment during the third and fourth months. In this connection, similar testicular changes have been described in autopsy material from victims of the Dachau prison camp.

Pituitary

Large basophilic cells with much cytoplasmic vacuolation appeared in the pituitary gland of 25 per cent of the males dying during the third to sixth weeks. Because cells of this type are found in mammals after castration, they are known as "castration cells." In the second and third months large basophils are found, only a few being vacuolated.

Ovaries

Changes in the ovaries are much less striking than in the testes. Gross changes, except as part of the hemorrhagic phenomena, are absent. Histologically, primary ova are usually present, and only occasional specimens have a few atretic primary follicles. Developing follicles are seldom found. A "resting phase" of the endometrium reflects the ovarian picture. Clinical observation in Nagasaki indicated that amenorrhea was definitely increased and that the rate of premature termination of pregnancy among women within a 1500-yard radius of the explosion was significantly higher than normal.

Skin

The quickly visible changes in Japanese exposed to an atomic bomb were the pigmented areas that appeared in the first few weeks and persisted. These had such sharply demarcated outlines that they were considered flash burns. Development of what is usually recognized as ionizing ray skin burn was not seen. In a few early cases there was said to be bullous edema that may have been caused by gamma rays.

Epilation appeared on the scalp, occasionally being more severe on one side than the other. Axillary epilation was an accompaniment in 16 per cent, pubic in 12 per cent, and eyebrow in 8 per cent.

Microscopically, the hair follicles show distinct changes both in the epidermic and dermic coats. Early specimens were not obtained, but in those of the fourth week the internal root sheaths cannot be identified, the external sheath (continuous with the malpighian layer of the epiderm) being continuous with the hair shaft. Vascularity of the papillae is reduced and the adjacent epithelium is atrophic. Pigment is irregularly clumped. Then in the dermic coat, both the inner hyaline membrane and the cellular fibrous layer become thickened. The base of the follicle apparently undergoes continuous shrinkage, pushing the base of the hair toward the surface, until regeneration begins with new cells over the papillae. This process mimics normal hair replacement. There is also atrophy of the sebaceous glands in some cases. Some of the sweat glands are small, their cells occasionally vacuolated and pyknotic, and the basal membranes thickened.

Evidence of radiation effect on the epidermis is not definite. Third degree flash burns could be expected to include some radiation effect, but interpretation is difficult. In patients dying on the fifth day, there is necrosis of vessel walls and thrombosis. Hyperpigmentation in basal cells and chromatophores are common at the edge of burn areas. Some thinning of epidermis, hyperkeratosis, ironing out of papillae, and hyperpigmentation of basal cells are found in the scalp (the most usual specimen). Erythema or pigmentation from ionizing radiation has not been recognized in the Japanese.

Adrenal

During the first two weeks there seems to be a loss of lipoid in the adrenal cortex, but during the next months it progressively loses its orange-yellow color and is distinctly thin. Microscopically, most cells are granular rather than foamy and atrophy is most marked in the outer zona glomerulosa (contrary to what was expected). When foam cells are present, they are usually in the inner layer. The medulla is normal.

Liver

Doctor Ono, Professor of Pathology at Fukuoka, was impressed with the large nuclei of liver cells around the central veins and the congestive edema in that region; however the presence of any irradiation effects is a moot point.

Urinary Tract

Except for hemorrhagic manifestations there are no apparent lesions. In the bladder during the hemorrhagic stage of the radiation disease, mucosal hemorrhages may result in necrotizing ulceration without evidence of leukocytic infiltration. The prostate and seminal vesicles are not remarkable except for a rare neutropenic necrosis and the presence of a few morphologically normal spermatozoa.

Brain

Only secondary hemorrhagic and necrotic changes are found in the brain.

Comment

The effects of the atomic bomb on human beings are on the basis of trauma from flying debris, thermal radiation and ionizing radiation. The ionizing radiation effects of the bomb comprise a small part of the total injuries; the changes produced are widely varied, depending on distance from the explosion and amount and character of shielding.

Clinically and pathologically the patients affected by radiation were easily separated into four

(Continued on Page 318)

MEDICAL ASPECTS OF ATOMIC WARFARE

As Related to Civilian Defense

JOSEPH M. RYAN, M.D.
Saint Paul, Minnesota

WITH the sudden and dramatic end of World War II in August, 1945, several new words were added to our everyday vocabulary. The words, "radiation," "radioactivity," "neutron," "fission," et cetera, have cast a spell of fear over us. A fear of the unknown tends to make us hide our heads in the sand and avoid the reality of the true nature of the problem at hand. The problem before us now is to obtain a knowledge of the medical effects of atomic warfare. The term "radiation" has been stressed so much that more important but less fearful effects are neglected. It is important that we know of the blast and burn casualties that can be expected if a community were subjected to the same force expended over Hiroshima and Nagasaki. As physicians, we must be aware of these facts; we must realize that those who are casualties of war need not be hopelessly injured and that we have at hand methods of caring for them. This paper is presented at a time when Civilian Defense is an extremely important problem. No physician should consider himself unimportant in civilian defense because of his location, either rural or urban, for if a large urban community were subjected to atomic bombing, help in caring for its casualties would necessarily be given in part by the doctors of the surrounding areas.

Radiation associated with the explosion of an atomic bomb includes two major types: (a) Thermal and (b) Nuclear. Because of its importance and the large number of casualties resulting from it, we shall consider thermal radiation first. Approximately 95 per cent of all burns were produced by this effect.

Thermal radiation is that which is emitted from hot materials within the exploding bomb. Within 0.1 millisecond after detonation, the ball of fire has a temperature so high that radiation occurs. This consists of ultra-violet, visible, and infra-red radiations when it reaches the earth. Part of these rays are reflected and part are absorbed. The portion that is absorbed is of importance to us. The extent of the amount absorbed depends upon the nature of the matter and its color. Black cloth absorbs much more than that of a lighter color. The absorption may be so great that the material will burst into flames and produce a flame burn to the individual wearing the clothing. It was noted at Hiroshima and Nagasaki that white clothing afforded more protection to "flash" radiation than did darker clothing. The burns produced by this type of radiation caused pigmentation, depigmentation, vesiculation, erythema, and full thickness skin loss, depending upon the distance from point O. Burns were of little significance beyond 3,000 meters. Five per cent of all burns resulted from flame or secondary fires. Here, again, all degrees of burn casualties were found at Hiroshima and Nagasaki.

Nuclear radiation is of less importance, as far as casualties are concerned, than thermal. It is estimated that such casualties made up only 15 to 30 per cent of the total number at Hiroshima and Nagasaki. When an atomic bomb explodes, it emits nuclear radiations consisting of gamma rays, neutrons, beta particles, and a small portion of alpha particles. It is not necessary to discusss the action of these radiations except to say that gamma rays and neutrons have considerable penetrating power and can produce harmful effects on living organisms. Likely, there is little effect from this type of radiation beyond one mile from O.

The medical aspect of nuclear radiation injury and its therapeutics is indeed wanting. We have no specific measures to be carried out, but we know that those who survive the second week have a good chance of recovery. It is in this group that we can do the most good. Antibiotics, blood, plasma, vitamins, electrolytes, "doca," and sedatives are useful in treating patients in this category.

Mechanical injuries resulting from an air-burst atomic bomb were somewhat different from the effect of the conventional bombing of London

---

Presented before the Clay-Becker Medical Society, Moorhead, Minnesota, on December 1, 1950.

Dr. Ryan is Chairman of the Ramsey County Medical Society Committee on Civilian Defense. He was formerly Chief of Medicine for the Manhattan District at Oak Ridge, Tennessee, 1943-1946.

when one considers the direct blast effect. In London, there was much visceral damage, while in the Japanese cities there was very little or none. Autopsies on the early cases showed no typical blast damage to the lungs. It has been suggested that this difference can be explained by the trip hammer blow produced by the conventional "block buster."

The indirect effect of blast produced tremendous bodily damage. Falling buildings, flying glass and debris caused fractures, contusions, and lacerations. These injuries were the same as we would expect following a tornado, cyclone, earthquake, or any such catastrophe. The treatment would necessarily be the same, as there is nothing characteristic of injuries produced by the indirect blast effect of an atomic bomb.

We should expect to find many individuals who have had severe crushing injuries such as were found in the bombing of London in 1940. The "Crush Syndrome" associated with "Lower Nephron Nephrosis" was prevalent at that time and can be expected to be present in large numbers if an American city were bombed either with a conventional or an atomic bomb. The amount of blood, plasma, and antibiotics that would be required to treat casualties is so tremendous that obtaining these seems an impossible problem. However, in the event this country is bombed in the near or distant future, we must all be prepared to do our utmost in meeting all of the situations mentioned in this paper. We should not let the thought of nuclear radiation hynotize us and thus prevent sensible and rational planning for medical civilian defense. We must anticipate the mechanical and burn injuries and not lose sight of the fact that they constitute by far the greater number of casualties.

Conclusions

1. As physicians, we must take an active part in civilian defense.

2. Nuclear radiation caused only 15 to 30 per cent of the casualties at Hiroshima and Nagasaki.

3. Burns and crushing injuries must have a high priority in planning civilian defense.

PATHOLOGY OF IONIZING RADIATION

(Continued from Page 316)

distinct categories of disease (very severe, severe, moderate, mild) with close relation between severity and time and incidence of mortality. The outstanding symptoms were nausea and vomiting on the day of the bombing, followed soon by fever, leukopenia, diarrhea, and after two weeks, epilation, purpura, and oropharyngeal lesions.

Summary

The lymphoid and hematopoietic tissues, skin, genital organs, and gastrointestinal tract were most severely affected by ionizing radiation. There was atrophy of lymphoid elements in lymph nodes, tonsils, spleen, and gastrointestinal tract. Atrophy of the bone marrow was evident early, and it either continued or was followed by focal or diffuse hyperplasia with maturation arrest. Necrotizing inflammation of the oropharynx was prominent but limited to the third to sixth weeks. The scalp showed the surest external gross sign of ionization—alopecia, which, with hemorrhagic manifestations, appeared about the same time as the throat lesions.

The testes showed prominent microscopic changes, with almost every sex cell destroyed in all men who died. The ovaries showed very little more than extreme scarcity of proliferating follicles. In all time periods the intestinal mucosa was the seat of changes which varied from ulcerated hemorrhagic foci to focal or widespread necrosis and ulceration with formation of diphtheritic membranes.

UNUSUAL PYODERMAS (HIDROSADENITIS SUPPURATIVA, ACNE CONGLOBATA, DISSECTING CELLULITIS OF THE SCALP)

A Review

ROBERT R. KIERLAND, M.D.
Rochester, Minnesota

THE three unusual pyodermas under consideration, namely, hidrosadenitis suppurativa, acne conglobata, and dissecting cellulitis of the scalp, have many features in common; in fact, they frequently coexist and because of this merit consideration as a group rather than as single distinct entities.

These pyodermas are uncommon, protracted in their course, produce much discomfort and disability to those afflicted, are resistant to conservative therapeutic measures, produce severe scarring and are of unknown etiology. Men are afflicted more frequently than women, and the age distribution of greatest pyodermic activity is during the active sexual career, that is, the second through the fifth decades of life. In spite of these facts there have been few reports about these conditions since the original and subsequent articles on acne conglobata by Reitmann, Michelson and Allen and Belote; on hidrosadenitis suppurativa by Verneuil, Lane and Brunsting, and on dissecting cellulitis of the scalp by Hoffmann, Wise and Parkhurst and Barney. Nevertheless, the transactions of the various dermatologic societies report a number of these unfortunate cases and stress the difficulty of treatment together with the usual philosophical statements based on lack of knowledge. Unfortunately, I have no greater knowledge of the basic physicochemical factors necessary in the production of these unusual pyodermas. What I shall say then is a composite of opinions from the literature, from informal discussions and from personal experience in the treatment of patients who have these disorders.

Clinical Characteristics

Hidrosadenitis suppurativa is a chronic, indolent, suppurative, inflammatory disease involving the skin, subcutaneous tissues and apocrine glands with sites of predilection for the perianal, genital, inguinal and axillary areas, which in its progress produces abscesses, sinuses and ulceration (Figs. 1 and 2). The primary lesion is a deep-seated, tender nodule which either resolves spontaneously in a matter of weeks or progresses to abscess formation with subsequent drainage (Fig. 1*a*). The suppuration may persist with development of new nodules or extension of the process in the subcutaneous tissues. As a result linear inflammatory cords (Fig. 1*b*), multiple sinus tracts and undermining, burrowing ulcerations may appear (Fig. 1*c*). The disease is subject to remissions and exacerbations and may persist for years. Secondary erysipelas or cellulitis with associated systemic symptoms is not uncommon; otherwise, serious systemic complications are few. Squamous-cell epithelioma rarely develops in regions of infection. Hidrosadenitis oftentimes follows a minor pyococcic infection of the fingers or hand.

Acne conglobata (Fig. 3) is also a chronic indolent inflammatory suppurative disease involving the skin and subcutaneous tissues although the primary inflammatory reaction is about the sebaceous apparatus rather than the apocrine glands and papulopustules result. Comedones are numerous, large, grouped and scattered over the body; the double comedo and comedo scar of Lang and Spitzer are considered characteristic of this condition. The inflammatory reaction begins as a follicular nodule in the center of which may be one or more comedones. The nodule increases in size, becomes purulent and later is covered by a crust underneath which is a deep ulcer. As peripheral extension proceeds, healing may appear centrally. As healing and activity go on together fusion of two or more plaques may result in a large serpiginous plaque characterized by infection, abscesses, communicating channels and sinuses, comedo scars and scarring. This condition may be found on the trunk, buttocks, thighs and arms. It is seen in conjunction with the other two unusual diseases of the skin under discussion and also acne keloid.

Dissecting cellulitis of the scalp, as its name implies, is confined to the scalp (Fig. 4), rarely

spreads to the nuchal area and usually is found as the sole condition but occasionally occurs in combination with hidrosadenitis suppurativa and acne conglobata. As the ponderous Latin derived name, "perifolliculitis capitis abscedens et suffodiens," implies, the reaction is confined to the scalp and is composed of burrowing, undermining abscesses and follicular and perifollicular inflammation. The early lesion appears as a superficial or deep inflammatory nodule, from which the hairs may be extracted with but slight traction. The nodules enlarge and, as more appear, become connected with each other so that ultimately the vertex and occiput may be covered with a maze of intercommunicating sinus tracts. Pressure in one nodule will cause pus to escape from one or several other nodules and sinuses often at a distance of several inches. After eventual healing, which may require years, elevated nodules and ridges and atrophic scarring remain; the appearance is not unlike that of the convolutions of the brain. Comedones and superficial papulopustules are rarely found.

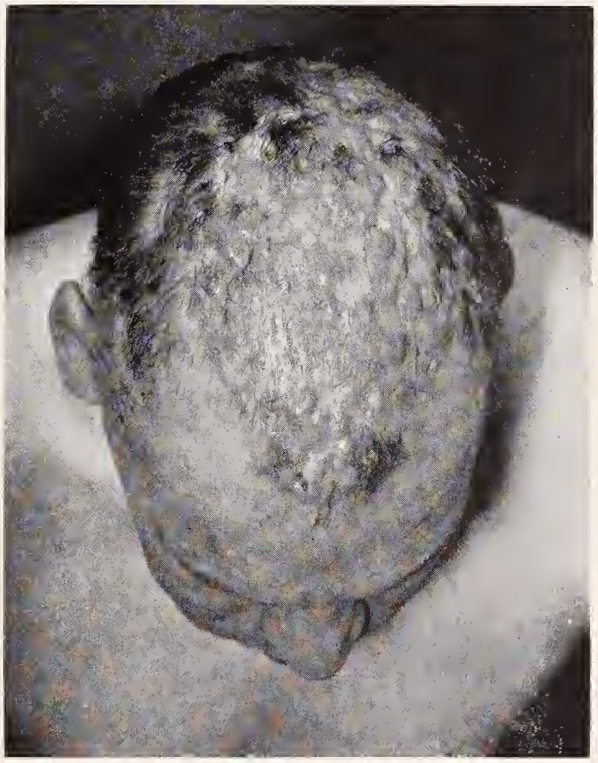

Fig. 4. Dissecting cellulitis of the scalp; linear undermining lesions and islands may be noted with normal growth of hair.

Differential Diagnosis

In typical cases the diagnosis of these uncommon three types of pyoderma is made without difficulty. In the early course, hidrosadenitis suppurativa must be distinguished from the more superficial pyococcic furuncle and carbuncle and occasionally from erysipelas, lymphadenitis and cellulitis. As the process becomes more extensive with the production of deep undermining sinuses and corded scarring, colliquative tuberculosis and the deep mycoses must be considered as well as the chronic, undermining, burrowing, nongangrenous ulcer that Meleny described in 1935.

Acne conglobata is recognized easily for the most part but cystic, indurative and cachectic acne may simulate the signs of acne conglobata; tuberculosis, syphilis and the deeper mycoses are to be ruled out by appropriate examinations on rare occasions but the characteristic comedo scar is seen only in acne conglobata. The indolent abscesses may suggest bromoderma or systemic blastomycosis.

Dissecting cellulitis of the scalp is a readily recognized condition when seen in its entirety and at the height of its activity. In the terminal phases, however, it should be distinguished from the scarring alopecias,[7] especially folliculitis decalvans and pseudo-pelade. Dissecting cellulitis of the scalp further may be separated from folliculitis keloidalis (acne keloid, dermatitis papillaris capillitii) but in this connection it should be noted that the two conditions may be found in the same patient together with hidrosadenitis and acne conglobata. All three conditions are quite distinct clinically from pyoderma faciale.[11]

Etiology

The cause of any of these pyodermas is unknown. Many theories have been advanced concerning the etiology but none are fully acceptable. Three determining factors appear which are as follows: (1) bacteriologic, (2) endocrine and (3) that most important and nebulous factor which may be defined as the "soil" of the patient or presence or absence of individual resistance.

Many bacterial organisms have been incriminated as specific causative agents in the production of these pyodermas. Yet not one of these has been proved to be the sole etiologic agent. Cultures have shown the predominant organism to be Micrococcus pyogenes, either albus or aureus. The work of Michelson and Allen and Belote on acne conglobata seems to indicate that while bacteriologically the organism is nonspecific the patient possesses an abnormal reactive capacity to such organisms. Brunsting also found no specific organism whereby the complete cause of hidrosadenitis could be explained.

In recent years the endocrine theory of etiology has found many proponents particularly in regard to the influence of androgens. While there is no doubt that such an androgenic influence exists, nevertheless this still does not explain the type of pyoderma to be produced or which is present in individual patients. The endocrine theory relates to a primary androgenic excess or to a disturbance of the androgen-estrogen ratio.

Why these three pyodermas together with others such as acne keloid and acne vulgaris may coexist in one case, or why in another hidrosadenitis may be the only cutaneous infection, and in a third only acne conglobata or dissecting cellulitis is found is not known. Part of the answer to these questions relates to the anatomy of the affected parts, that is, the loose areolar tissue of the scalp or the apocrine gland of the axillas and the anogenital areas. It is this final consideration which always leads back to the nebulous theory that it is the patient's resistance, background or "soil" that determines the capacity to react in certain specific instances. There are but few scientific facts known which help in the elucidation of this problem. Genetic factors have been implicated but have not been worked out well or completely.

Histopathology

The histopathology of these three pyodermas is essentially that of infection varying only as to the anatomy of the involved area.

Hidrosadenitis Suppurativa.[12,15]—The earliest infiltrate is seen within the lumen of the apocrine gland and in the adjacent periglandular tissues suggesting that the infection begins in the gland proper. The infection then spreads by way of the lymph spaces and channels which contain many leukocytes and sometimes clumps of cocci. In some sections there is relatively little periglandular inflammatory reaction and the infection is confined to within the gland while in others marked periglandular inflammation occurs. The infection spreads throughout the subcutaneous tissue and the eccrine glands become involved from without. Later there is a perivascular infiltrate of plasma cells and lymphocytes. In the late stages remnants of the epithelial cells of the gland wall are found together with foreign-body giant cells. The epidermis and upper parts of the cutis are affected after extensive destruction of the subcutaneous tissue has occurred.

Acne Conglobata.[10]—The histopathology of acne conglobata varies to some degree with the age of the lesion. The epithelial changes are more uniform and consistent than those in the corium. The epidermis reveals marked hyperkeratosis without parakeratosis. The basal layer remains intact but the prickle cell layer is reduced to a single or double row of cells except where horny plugs are found—here the prickle cell and granular layers exhibit an increase. Cornified whorls going on to the formation of keratotic cysts are seen. Variously sized single and double comedones are present.

The infiltrate is primarily perifollicular in the corium and is composed of polymorphonuclear leukocytes, plasma cells and lymphocytes with a few giant cells. Abscess formation is found in some areas.

Scars show loss and destruction of elastic tissue, large comedones, moderate sclerosis of the corium and marked atrophy of the epidermis. The pathologic findings resemble those of acne vulgaris.[8]

Dissecting Cellulitis of the Scalp.[1]—The infection begins as folliculitis with destruction of the follicular wall. Subsequently there is severe perifolliculitis with purulent destruction of the deep part of the follicle and disintegration of the hair. The process then extends into the deeper layers of the scalp as cellulitis and the undermined, connected lesions present clinically are produced. The infiltrate is composed of lymphocytes and plasma cells in old lesions; polymorphonuclear leukocytes are present in areas of fluctuation and suppuration. Giant cells of the foreign-body type are frequent and contain remnants of hair either as small fragments or as clumps of brown pigment. The chronic inflammatory process progresses to a deep and extensive fibrosis with loss of elastic fibers. The absence of epidermal atrophy and the presence of hair follicles are prominent features and are somewhat surprising when the final keloidal appearance and fibrosis are considered.

Treatment

The treatment of hidrosadenitis suppurativa, acne conglobata and dissecting cellulitis is similar and consequently that of all three will be discussed together with remarks about measures which may pertain to any certain condition and not to the others. Treatment may be divided into general systemic and local. Local treatment may be conservative or radical.

Systemic treatment is directed toward the maintenance of the general health and well-being of the patient and toward the correction of metabolic faults. Dietary factors should be dealt with according to the experience of the patient. Persons who have hidrosadenitis and acne conglobata sometimes are inclined to obesity. They should reduce. If chocolate, nuts and rich pastries tend to increase the severity of the pyoderma, they should be excluded from the diet. For the most part, however, a diet rich in protein but moderate or low in fat and carbohydrates is given together with vitamin supplements. In addition to dietary instructions the patient is instructed concerning adequate exercise and rest.

Thyroid by mouth, 1 to 2 grains (0.065 to 0.13 gm.) daily, seems to have definite value for certain individuals. Estrogenic preparations, such as stilbestrol 0.1 to 0.2 mg. or premarin 0.625 mg. daily for three out of four weeks, may be given to the female patient as well as the male provided that strict observation is made for the development of untoward signs of estrogenic activity.

Antibiotics administered by mouth, intramuscularly, or even injected locally in and about abscesses or applied locally in the form of wet dressings or ointment are of definite benefit when there is much acute inflammation and when the process is of short duration; however, such treatment is of much less value when the process is a scarring one of long duration with only a few islands of infection in the midst of the scar. Then, too, antibiotics do not prevent reactivation of the pyoderma when the infection has been previously brought under control with antibiotics or other measures.

Local therapeutic measures, of course, are instituted at the same time as the general measures. The usual medication offered the patient with acne vulgaris is of little value to patients who have these lesions because of the depth of the infective process under the epidermis.

Heat either in the form of infra-red light or a hot wet dressing of tap water or of a 1-in-16 dilution of Vleminckx's solution applied to sites of involvement is of help to the patient. This, together with incision and drainage of the fluctuant abscesses, may even cure a few patients early in the course, especially those with hidrosadenitis.

For patients who have extensive areas of skin affected as in acne conglobata and some with hidrosadenitis, sulfur baths according to the following formula may be given once daily or less often:

Sulfur precipitate	500.0
Sodium hyposulfate	120.0
Dilute sulfuric acid U.S.P.	250.0
Distilled water to make	4,000.0

Directions: Use ½ to 1 pint of formula in each bath. After the bath of twenty to thirty minutes' duration, pat dry, don't rub.

These patients may also be given suberythema doses of ultraviolet light, gradually increasing the duration of each exposure so that a tan results.

If comedones are present as in acne conglobata, they should be expressed. The loose hairs present in the affected sites of hidrosadenitis or dissecting cellulitis should be manually epilated. Recently I have been treating the oily cysts of acne conglobata with electrodesiccation[4,14] with success. This treatment may be applied to the more active inflammatory nodules as well and to the comedones themselves.

Roentgen therapy remains one of the best therapeutic measures available for hidrosadenitis. The earlier it is used the better the results, for when much scarring has occurred nothing will help except radical surgical excision. The roentgenologic factors used at the Mayo Clinic are: 130 kv., 6 ma., 5 mm. aluminum filter and target-skin distance, 16 inches. One hundred roentgens are given with the above factors twice a week for four to five exposures for acute hidrosadenitis. For subacute hidrosadenitis 150 r are given twice a week for four to five times, while for chronic lesions 150 r are given twice a week for three to four times. This treatment may be repeated in a month if necessary. Not all dermatologists use this technique by any means, but my colleagues and I consider that the advantages lie in the higher kilovoltage and filtration thus allowing the ray to penetrate into the basic lesion. Modifications of our technique may be used for dissecting cellulitis and acne conglobata.

With all that has been mentioned concerning treatment there are many patients who continue to have exacerbations of the pyoderma, who are in pain, and who are disabled. Radical surgical excision is indicated and provides the only cure for these patients and for those whose pyoderma is characterized by marked ulceration and by scarring with interspersed islands of infection. The areas of infection and scarring if possible are excised widely and deeply so that the surgical procedure carries into normal healthy tissue (Fig. 5*a* and *b*). A split skin graft may then be applied especially in areas where contractures are detrimental, or the wound may be covered by pinch grafts, or if the wound is not too large it may be allowed to epithelialize of its own accord without the aid of grafting. Macey[9] has discussed this subject as it pertains to axillary hidrosadenitis, and the same technique may be applied to other areas of the body. In certain areas, especially the anogenital region, the site of the excision is subject to infection and grafts do not take well (Fig. 5*c* and *d*); hence, here it is best that the wounds be as small as possible so that epithelialization may proceed with the least amount of difficulty. In the scalp the areas of excision should correspond to the convolutions of the infection so that the scalp may be covered with hair arising from the uninvolved sites.

Surgical procedures in multiple stages may be done as necessary as new areas become affected or in the event that the infected areas are too large or disseminated to be treated by a single procedure. On occasion a solitary plaque of infection and scarring as in acne conglobata may be too large to permit total excision at one time; for such a patient excision of various portions should be done as multiple procedures. It behooves the dermatologist to recognize the limits of his specialty. If satisfactory results are not obtained by conservative measures and if the dermatologist is not capable of performing the indicated surgery, the patient should be referred to a competent surgeon.

Summary and Conclusions

A brief review of the data on hidrosadenitis suppurativa, acne conglobata and dissecting cel-

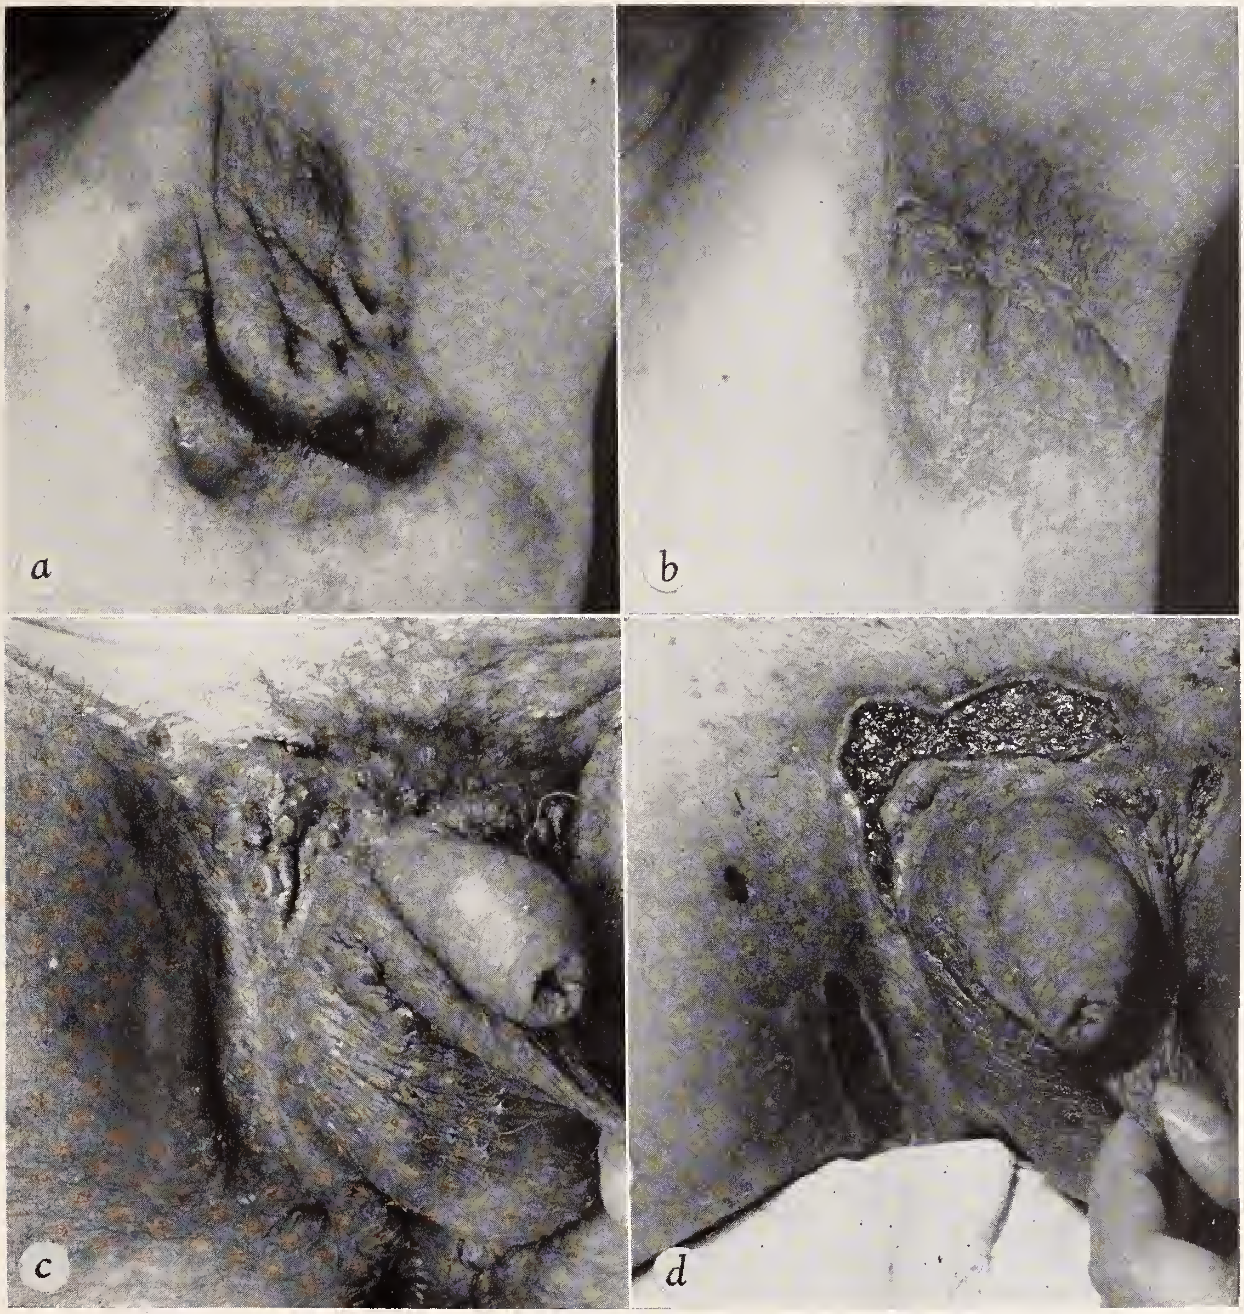

Fig. 5. Hidrosadenitis suppurativa: *(a)* of left axilla before wide total excision and graft; *(b)* after excision and graft, same case as *(a)*; *(c)* prior to surgery in another case; *(d)* same case as *(c)* after excision and saucerization; wounds are clean and granulating.

lulitis of the scalp has been given. Emphasis has been placed on treatment and it has been stressed further that when the patient does not respond to conservative methods of therapy including roentgen rays, the patient should then undergo radical surgical excision of the areas of infection and scarring. These uncommon pyodermas are but similar expressions of the same basic pathologic change and disease.

THE EFFECT OF VITAMIN K_1 ADMINISTERED ORALLY ON THE CONTROL OF THE COAGULATION DEFECT INDUCED BY DICUMAROL

BENJAMIN F. FULLER, M.D., and
NELSON W. BARKER, M.D.
Rochester, Minnesota

SINCE the introduction and widespread use of dicumarol as a valuable anticoagulant for the treatment and prophylaxis of thrombotic and thrombo-embolic disease there has been a need for a drug which would control rapidly the coagulation defect induced by dicumarol. The synthetic preparations having vitamin K activity, such as menadione (2-methyl-1,4-naphthoquinone), were first used. In early studies at the Mayo Clinic it was found that small doses of menadione were ineffective in most instances. In 1942, Overman, Stahmann and Link reported that menadione would inhibit the effect of dicumarol in rabbits. In 1943, Shapiro, Redish and Campbell found that large doses would give the same effect in man. In 1943 also, Davidson and MacDonald reported that the prothrombin time in three out of four patients who had received dicumarol was restored to normal soon after intravenous administration of large doses of vitamin K_1 oxide (one of the naturally occurring substances having vitamin K activity). Lehmann reported that hemorrhage after dicumarol was controlled by transfusions of blood and large doses of menadione by mouth.

In 1944, Cromer and one of us (Barker) reported studies on the intravenous administration of 64 mg. of menadione bisulfite to patients whose prothrombin times rose to levels indicating less than 10 per cent prothrombin activity following the use of dicumarol. It was found that eighteen hours after its administration the prothrombin time of thirty-five of the thirty-seven patients tested decreased significantly.

Davidson, MacDonald and Freed, and Lucia and Aggeler also reported on the successful treatment of the coagulation defect produced by dicumarol with intravenous administration of vitamin K_1 oxide.

Recently there has been a renewal of interest in the use of vitamin K_1 oxide. James, Bennett, Scheinberg and Butler found in a careful study that the prothrombin activity which had been depressed by dicumarol rose to levels above 30 per cent in twenty-six patients given vitamin K_1 oxide intravenously. It took an average of thirteen hours from the time of administration to obtain this effect.

Miller, Harvey and Finch found that vitamin K_1 and vitamin K_1 oxide were effective in decreasing the prothrombin time in doses of from 500 to 1,000 mg. It exerted its effect in four to twenty-four hours after intravenous administration. Vitamin K_1 was found to be slightly more effective than vitamin K_1 oxide. Their patients tended to show increased refractoriness to dicumarol for periods up to two weeks following a single dose of either of these substances. They suggested that this be kept in mind when the use of these substances is contemplated for patients with thrombo-embolic disease.

Our experience with vitamin K_1 (2-methyl-3-phytyl-1,4-naphthoquinone) in fourteen patients who had received dicumarol is summarized in Table I. It was administered orally in a 500 mg. dose in gelatin capsules each containing 250 mg. It was given between 4:00 and 5:00 p.m., and the blood was drawn for the determination of the prothrombin time between 8:00 and 11:00 a.m., the following morning.

All determinations of the prothrombin time were done by the Magath modification of the Quick method. With the thromboplastin which is used in this test the normal prothrombin time is 17 to 19 seconds. Prothrombin times corresponding to 30 per cent, 20 per cent, and 10 per cent of normal prothrombin activity as determined from a dilution curve are 27 seconds, 35 seconds, and 58 seconds, respectively.

In addition, tests were made on two patients not listed in Table I four and eight hours after administration of vitamin K_1. A significant drop in prothrombin time was noted at the end of four hours. Eight hours after administration, the prothrombin time of the first patient had dropped from 37 to 21 seconds and that of the second patient from 39 to 26 seconds.

This work was done while Doctor Fuller was a Fellow in Medicine, Mayo Foundation. Doctor Barker is Consultant in the Division of Medicine, Mayo Clinic, Rochester, Minnesota.

TABLE I. EFFECT OF 500 VITAMIN K_1 ON QUICK PROTHROMBIN TIME AND ON PROTHROMBIN ACTIVITY

Case	Quick Prothrombin Time, Seconds		Prothrombin Activity, Per Cent		Amount and Effect of Menadione Bisulfite Given Intravenously
	Before K_1*	20 Hours Later	Before K_1*	20 Hours Later	
1	92	23	7	50	None given
2	55	23	11	50	None given
3	100	25	6	40	None given
4	48	21	13	60	None given
5	57	19	10	80	None given
6	44	21	14	60	None given
7	44	21	14	60	None given
8	62	22	10	55	None given
9	29	21	27	60	None given
10	41	28	16	29	None given
11	34	21	21	60	36 mg. 24 hr. earlier; minimal effect.
12	92	23	7	50	72 mg. daily for 2 days without effect.
13	29	19	27	80	72 mg. daily for 3 days with minimal effect.
14	48†	21	13	60	72 mg.; repeated 4 and 8 hr. later. (Patient in renal failure.)

*500 mg. of vitamin K_1 by mouth.
†250 mg. of vitamin K_1 by mouth.

In Cases 12 and 14 (Table I) a "rebound" phenomenon occurred. That is, the prothrombin time rose again to levels of 52 seconds and 41 seconds, respectively, over a three-day period, although no dicumarol had been given for several days. A second dose of vitamin K_1 controlled this. The blood urea of both of these patients was high.

It can be seen that the prothrombin time of thirteen of the sixteen patients who were tested returned to near normal levels and that of the other three was significantly decreased twenty hours or less after administration of vitamin K_1.

Comment

When the effectiveness of any dicumarol antagonist is being evaluated, it is important to think in terms of prothrombin activity rather than in terms of prothrombin time. The reason for this is apparent when the fact that the relationship between the two is not a linear relationship is considered. In other words, with the thromboplastin used at the Mayo Clinic the reduction of prothrombin time from infinity to 60 seconds would represent an increase of prothrombin activity of only 10 per cent while the reduction of the prothrombin time from 27 to 18 seconds would represent an increase of prothrombin activity of 70 per cent. These percentages are computed from a curve on which various dilutions of normal plasma are plotted against the prothrombin time for each dilution.

Results of the work of Cromer and one of us (Barker) with menadione bisulfite, previously mentioned, briefly can be compared to the results of our work with vitamin K_1. Cromer and Barker studied the effect of a single dose of 64 mg. of menadione bisulfite on the excessive hypoprothrombinemia induced by dicumarol. In a total of thirty-seven cases studied, they obtained reduction in prothrombin time in eighteen hours as follows: (1) to less than 55 seconds (about 10 per cent prothrombin activity) in 95 per cent of cases, (2) to less than 45 seconds (about 15 per cent prothrombin activity) in 81 per cent, and (3) to less than 35 seconds (about 20 per cent prothrombin activity) in 59 per cent.

With a single oral dose of 500 mg. of vitamin K_1, the prothrombin time in our patients was reduced to less than 27 seconds (30 per cent prothrombin activity) in fifteen of the sixteen patients (about 94 per cent) in less than twenty hours. This is in agreement with previous reports.[4,7]

On the basis of the information which is available in respect to the dicumarol antagonists, definite therapeutic implications seem possible. When dicumarol is given, the dosage is varied in amount and frequency in such a way as to keep the prothrombin time within the therapeutic range. With the thromboplastin which is used for prothrombin time determinations at the clinic, this range is between 27 and 58 seconds which corresponds to prothrombin activity between 30 and 10 per cent of normal. An ideal range is considered to be from 35 seconds to 45 seconds (prothrombin activity of 20 per cent to 15 per cent of normal). These ranges are selected on purely empirical grounds and are based on the observation that few patients have intravascular clotting when the prothrombin activity is less than 30 per cent of normal and bleeding is infrequent when the prothrombin activity exceeds 10 per cent.

Little difficulty is encountered in the day-to-day management of patients who are receiving dicumarol if they are properly selected.[6] However, patients who are receiving dicumarol for whom it is desirable to lower the prothrombin time tend to fall into three groups. In Group 1 are those patients whose prothrombin time reaches a dangerous level, but who present no clinical evidence of overdosage. It generally is desirable to lower the prothrombin time of these patients but to continue anticoagulant therapy. Group 2 consists of those patients for whom it becomes desirable to discontinue anticoagulant therapy completely and as rapidly as possible, but no immediate emergency exists. An example of such a patient would be one in whom renal failure began to develop while he was on treatment with anticoagulants. Group 3 consists of patients who sustain sudden and severe bleeding. While this group is small numerically, it is made up of the patients who have truly emergency conditions.

With this classification in mind, it would seem to follow that the condition of patients in Group 1 could be adequately controlled with intravenous administration of 32 to 64 mg. of menadione bisulfite, since it usually brings the prothrombin time from a dangerous to a therapeutic level. Although it may render a patient a little more refractory to subsequent dicumarol therapy, it does not, as a rule, seriously interfere with continuation of treatment.

The condition of patients of Group 2 can usually be controlled with vitamin K_1 in doses of 500 mg. by mouth, insofar as present experience indicates.

Patients of Group 3 are still the greatest problem, since none of the available dicumarol antagonists exert a rapid enough action to have any significant immediate effect. The immediate treatment of this group must continue to be supportive with replacement of lost blood and local treatment at site of bleeding if possible. Also, the use of vitamin K_1 is indicated in preference to the use of menadione because its action is more rapid and more nearly complete than that of menadione.

One consideration in the oral use of vitamin K_1 as a dicumarol antagonist should be mentioned, although at present it is largely theoretical. Since vitamin K_1 is a fat soluble vitamin, its absorption is retarded in the absence of bile from the intestine and its effectiveness is thereby reduced. Thus, in the presence of an external biliary fistula it could be quite ineffective in combating a prothrombin deficiency. We have had experience with only one such case, and in that case vitamin K_1 was ineffective. It is possible that the simultaneous administration of bile salts to such patients would increase the effectiveness of vitamin K_1, although we have had no experience with this.

Summary

Our experience with vitamin K_1 indicates that it is a satisfactory dicumarol antagonist when given in a single oral dose of 500 mg. This is in agreement with the experience of others who have used the drug.

Vitamin K_1 appears to exert a more rapid and more nearly complete action than menadione.

No toxic or untoward effects were observed in any of our patients following the use of vitamin K_1.

Watching for a "rebound phenomenon," particularly in patients developing renal failure, is advisable.

CONGENITAL AURICULAR FISTULA

BENJAMIN BOFENKAMP, M.D.
Minneapolis, Minnesota

ALTHOUGH congenital auricular fistula is a common anomaly, very little has been written about it and many physicians do not recognize the condition. This is reflected by frequent reports of misdiagnosed cases.[2,3] Three of the six cases seen by the writer during the past eight months had been previously diagnosed and treated as infected sebaceous cysts.

Congenital auricular fistula has a slit-like orifice leading into a tract a few millimeters deep. The condition may be bilateral, but is more commonly unilateral. The greatest number of fistulae appear in the preauricular region just anterior to the helix[1] (Fig. 1). Because of the frequent occurrence of the lesion in this location, it is often called preauricular fistula; however, the fistula may be postauricular or on the auricle proper. Microscopically, the tract is lined with stratified squamous epithelium.[5]

Various theories concerning the embryology of congenital auricular fistula have been presented, but the one most acceptable is the intertubercular theory of His.[5] According to that theory, the fistula is formed by inclusion of epidermis in one of the grooves existing between the six tubercles forming the external ear. Virchow's original theory of branchial origin now has few exponents. Congenital auricular fistula is regarded as being hereditary and is transmitted as an irregular dominant factor.[4] In two of the six cases reported here, other members of the family had a congenital auricular fistula.

When the fistulous tract becomes infected, the region about the fistula is swollen, inflamed, and tender. Slight digital pressure will produce purulent exudate from the primary tract or from a secondary fistula which results from chronic infection (Fig. 2). During the infected phase, the condition may be mistaken for a sebaceous cyst and improperly treated.

Treatment is indicated when the fistula is infected. Permanent cure can be obtained only by complete surgical excision of the primary and secondary fistulous tracts. Complete extirpation is facilitated if the tracts are injected with methylene blue, thereby staining all of the ramifications. The injection should be made at least a day prior to surgery so that the dye which escapes into the tissues adjacent to the tracts can be phagocytosed leaving only the tracts stained. This technique eliminates the possibility of removing more tissue than is necessary. Either local or general anesthesia may be employed. An elliptic incision is made in the skin about the fistula and the tracts removed *in toto* by sharp dissection (Figs. 3 and 4). Slight undermining of the adjacent skin is required before the wound is closed with interrupted black silk sutures and covered with a pressure dressing. Complete healing occurs within a week.

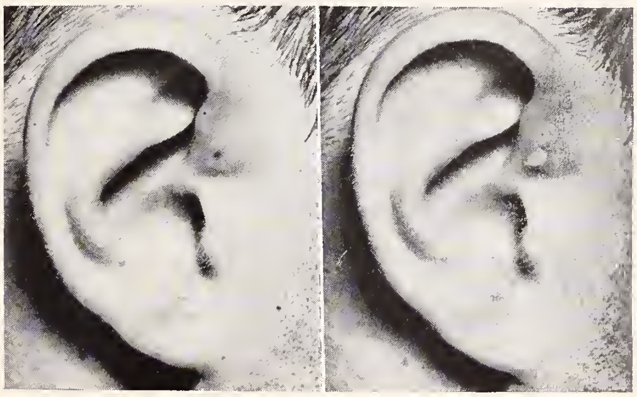

Fig. 1. *(left)* The dimpled area, anterior to the crus helix, is the most common location of congenital auricular fistula.

Fig. 2. *(right)* Digital pressure will produce a purulent exudate from an infected fistula.

Report of a Typical Case

A twenty-five-year-old white man had had bilateral preauricular fistulae since birth. Both fistulae had drained intermittently since early adult life. In January, 1949, because of a persistent irritating discharge, both had been incised, but continued to drain. The following July, incisions were repeated and followed by silver nitrate cautery, but the drainage persisted.

The patient's sister had bilateral preauricular fistulae which had never become infected. When the patient was seen on December 13, 1949, he had bilateral swollen, inflamed, cystic masses anterior to the crus helicis (Figs. 5 and 6). Firm finger pressure produced purulent exudate from the fistulous tracts. On the day of admission, the fistulae were injected with methylene blue and

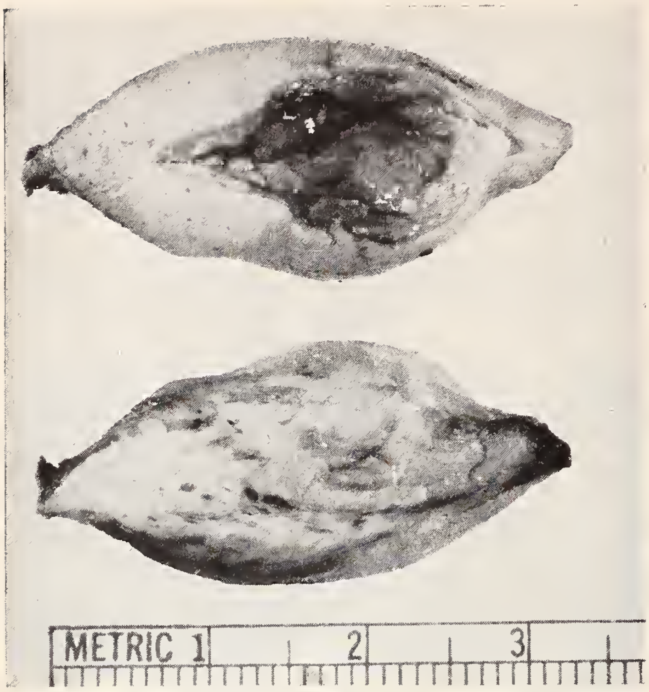

Fig. 3. *(above)* The excised bloc of tissue with the injected tracts dissected.

Fig. 4. *(below)* Under surface of the excised bloc demonstrating that the entire injected fistulous tract has been removed.

on the following day, under local anesthesia, the tracts were removed *in toto* through an elliptic incision. The wounds were closed with interrupted silk sutures and pressure dressings were applied. Five days later, the sutures were removed and the wounds were found to be healing well. Six months later the patient had had no further swelling or discharge (Figs. 7 and 8).

The pathologic specimens consisted of two similar elliptical pieces of skin-covered tissue measuring 2.5 cm. x 1.5 cm. x 1.0 cm. In the center of the skin portion of each of the two pieces, there was a slit-like opening leading into a sinus tract which ended blindly. The tracts were stained blue. Microscopically, the tracts were lined with stratified squamous epithelium and surrounded by plasma cells and lymphocytes.

Summary

Congenital auricular fistula is an anomaly which gains clinical significance if the tract becomes infected.

Excellent results can be obtained by complete surgical excision of the original fistula and its secondary tracts which result from infection.

A typical case of congenital auricular fistula with proper surgical management is presented.

INTRAVENOUS ANALGESIA AND AMNESIA IN OBSTETRICS

F. L. SCHADE, M.D.
Worthington, Minnesota

THE purpose of this presentation is twofold: first, to give some consideration to any plan of premedication in obstetrics; second, to present the method of intravenous obstetrical analgesia and amnesia as practiced in our hospital.

Premedication in obstetrics has at least the following functions to perform: first and foremost, it must meet the desires and welfare of the mother and her baby; second, it must meet the requirements of the physician.

The patient's welfare is met by the assurance that all that is done for her and her baby is for the best. This assurance is instituted early in the antepartum period with the object in mind of removing fear and apprehension. She is reminded that birth is one of nature's natural phenomenon—a phenomenon accompanied by a certain amount of discomfort, it is true, but with her co-operation and at the proper stage of labor when her pains are such that she desires some help and relief, we are able to give her prompt and almost total relief from her discomfort without interrupting the progress of her labor and with no harm to her baby. Ideally, premedication should produce psychic sedation and amnesia for the mother during the greater part of her labor and during the entire period of her delivery. The agents selected should permit the mother to rest between contractions and so build up her functional reserves. The technique should give rapid and pleasant induction; it should be devoid of hazards for mother and baby, yet offer the mother a pleasant and peaceful emergence from the entire event.

Adequate premedication should permit the obstetrician to practice a conservative policy in the conduct of labor. By and large, he prefers an unconscious patient who will remain perfectly still irrespective of the required duration, position or extent of the obstetrical procedure required for delivery. It is his desire that pospartum symptoms should be few or absent, and from this viewpoint due regard must be given to the complicating factors presented during the immediate antepartum period in the unitary plan of premedication.

The amnesic and analgesic agents and technique should possess a wide margin of safety for both mother and baby. The agents or technique should not be a cause of prolongation of labor, increased operative interference, or complication of labor. The drugs should be devoid of undesirable side effects to both mother and baby. The premedicants should permit exact control of the selected dose as there may be a wide individual variation in tolerance to the drug or drugs used. They must not interfere with the natural forces and protective mechanisms of labor.

Premedication in obstetrics is still a controversial subject even among the experts. However, I believe it is quite accurate to say that the combination of scopolamine and demerol is the method of choice among many obstetricians who desire analgesia and amnesic effects.

From the literature, scopolamine is found to have the following advantages in obstetrics:

1. It is the best amnesic available.
2. It produces psychic sedation with its accompanying relief of apprehension and anxiety, as well as dreamless sleep.
3. It prevents sweating and produces dryness of mucous membranes of the respiratory tract, often to a degree better than atropine.
4. It has the capacity of preventing the vagal type of carotid sinus syndrome.
5. It can relieve bronchospasm and in many instances laryngospasm.
6. It may increase maternal respiration and combat the respiratory depression produced by more potent cortical depressants.
7. Its effect on cardiac rate is not as apparent clinically as is that of atropine.
8. There are no demonstrable ill effects on fetal or neonatal vital functions.
9. Scopolamine can be administered by any route, and the duration of its desirable effects is about two hours.
10. Scopolamine appears to be less toxic than atropine and has a larger margin of safety.

Some of its chief disadvantages that have been pointed out are:

1. It lacks analgesic potency.
2. On occasions it is said to produce edema of the eyelids, lips or uvula.

3. When given intramuscularly, it has the cortical effect of producing excitement and overactivity in about 40 per cent of obstetrical cases.

Demerol hydrochloride is indicated for the relief of severe pain regardless of etiology. Its analgesic power ranks between morphine and codeine and respiratory depression is uncommon. The effect of demerol upon the pregnant uterus of human beings has been studied by Abreu and his associates, and it was found to have no significant effect upon uterine tone or activity. Demerol hydrochloride when used in control of labor pain has been shown to produce satisfactory analgesia, to shorten labor in the primipara, and to be without significant effect upon the baby.

Shortening of labor may be the result of the drug's spasmolytic effect on the cervix or may result simply because the bearing down is more vigorous when the pain threshold is raised. Demerol alone produces analgesia but not amnesia. If amnesia is desired, scopolamine or barbiturate also should be used.

During the past twenty-three months in 366 cases, three of which were twin deliveries, we have used the following premedication and technique—a method which in our experience has secured a high degree of satisfactory analgesia and amnesia with safety to the mother and a minimum or no effect on the newborn.

We give seconal, gr. ¾ or gr. 1½ by mouth following the admission enema. When the patient is making sufficient progress and begins to mind her pains, we administer 50 mg. of demerol and gr. 1/150 of scopolamine intravenously, and while giving the intravenous medication, the nurse gives the patient 50 mg. of demerol subcutaneously. The scopolamine is dissolved in 1 cc. of sterile water* in a 2 c.c. syringe to which is added 1 c.c. of demerol hydrochloride solution containing 50 mg. of demerol. A 25-gauge needle is used and the medication is slowly injected into the antecubital vein. It is important to take three or four minutes for the total injection. It is our custom to carry on a conversation with the patient while slowly injecting the drug and be watchful for any signs of sensitivity, such as a choking sensation or the expression of a feeling of impending disaster. In no instance have we had to discontinue the injection. In many instances the patient voluntarily states that she is experiencing a wonderful feeling and asks us what the drug is. In the majority of cases the patient is sound asleep between contractions in five to seven minutes after introducing the medication. In about 10 per cent of our cases the patient vomited while the needle was in the vein, but we did not discontinue the drug. My nurses inform me it is their impression that about 75 per cent of obstetrical patients receiving intramuscular scopolamine and demerol vomit and their vomiting is more copious and over a longer period of time.

In 322 deliveries of the 366 cases the medication was given only once, while in forty-three instances it was given twice. In only one case was it found necessary to give the medication three times before delivery was accomplished. The shortest time interval before repetition of scopolamine and demerol, intravenously, was one hour and thirty minutes, and the longest time interval was ten hours and fifty minutes. Omitting the three cases in which the time interval of repetition was over six hours, the average lapse of time before the medicine was repeated was two hours and fifty minutes.

The average length of time before delivery was accomplished after the last intravenous medication was one hour and twenty-one minutes. In computing this average I omitted those cases in which no demerol or scopolamine was given during the last four hours of labor. There were eighteen such cases in this series.

Less than 5 per cent of these patients receiving intravenous scopolamine showed any cortical excitation, in contrast with 40 per cent when using the intramuscular route.

When the intramuscular route was used in obstetrical cases, partial or total failures to obtain satisfactory amnesia were due to the fact that the patient received medication too late for material benefit. Due to the quick action obtained by using the intravenous route, the number of such failures is greatly reduced. No babies delivered by this method showed any persistent cyanosis, evidence of narcosis, or otherwise merited the term "sleepy baby," and short quiet labors were the rule. By the use of intravenous demerol and scopolamine, we can honestly tell our patient we can give her prompt and almost total relief from her discomfort without interrupting the progress of her labor and with no deleterious effects to her or her baby.

---

*For the past 2 months we have been using scopolamine in ampules (Burroughs Wellcome & Co.).

IMPRESSIONS FROM EUROPEAN NEUROSURGICAL CLINICS

LEONARD A. TITRUD, M.D.
Minneapolis, Minnesota

MOST of the summer of 1950 was spent in completing a tour of the principal European Neurosurgical Centers. The previous report* did not include the continental clinics.

The first visit was to the University of Zürich in Switzerland where the Sixth International Congress of Pediatrics met in July. A session was devoted to the neurosurgical problems of children in which a number of neurologists, neuropathologists, and neurosurgeons from various countries participated. The principal interests were concerned with hydrocephalus, subdural hematoma, convulsive disorders, and carotid-jugular anastomosis for the revascularization of the brain.

Professor Hugo Krayenbühl directs the neurology and neurosurgical departments at the University of Zürich. After training with Professor Hugh Cairns in England, he came to Zürich about 15 years ago to establish the first true neurosurgical center in Switzerland. During these years, the department gradually outgrew the bed and surgical facilities of the small hospital Professor Krayenbühl was granted by his old chief, Professor Claremont. In 1951, this service will move into a 900-bed surgical hospital that is under construction, and will have two air-conditioned operating rooms as well as its own electro-encephalogram and x-ray laboratories.

At the present, Professor Krayenbühl has eight assistants who care for the fifty-five neurosurgical bed service. Dr. G. Weber occupies the position of first assistant. The nonsurgical neurologic patients are treated on the medical service. There was a rather international coloring of the service with patients from South America, Spain, Italy, England, France, and Switzerland. Most of the clinicians spoke German, French, and English and in addition possessed knowledge of Spanish and Italian. During ward rounds with Doctor Max Klinger, the Professor's second assistant, it was observed that most of the problems were concerned with several varieties of brain and spinal cord tumors as well as with protruded intervertebral disks. Here, as in most University Clinics, the intervertebral disk problem was solved on the neurosurgical service. Spinograms were rarely done for disks which were believed to be herniating between the fourth and fifth lumbar or between the fifth lumbar and first sacral vertebrae. Cisternal spinograms were carried out regularly for high spinal canal lesions. Spinal fusions were rarely done for the patients who had protruded disks.

Approximately 500 verified brain tumor cases and 100 verified spinal cord tumor cases are treated here annually. Professor Krayenbühl has had extensive experience with spinal cord tumors and has reported on approximately 185 such cases. Cerebral arteriography began to be used extensively here in 1937 in localizing aneurysms and other lesions. The staff has found more than sixty angiomas and aneurysms by this means so far. The percutaneous method is used except for the vertebral arterial study where exposure of the vessel has provided the best results. A Lysholm x-ray table in a room adjoining the surgical suite facilitates the angiographic study. Doctor Hess very ably carries on extensive electro-encephalographic work with an eight-channel Grass instrument in this same clinic. Professor Krayenbühl attempts never to use either pneumo-encephalography or pneumo-ventriculography for cerebral neoplastic localization unless it is absolutely necessary. It is a policy to treat all the brain tumor cases postoperatively with deep x-ray. Ordinarily, doses of 12,000 to 14,000 roentgens are used. There was a recent experience with a patient who died about five months after having a glioblastoma multiforme partially removed and receiving postoperative roentgen therapy. No histologic trace of the tumor remained; but there was evidence of brain tissue destruction which could have been caused by the x-rays.

Approximately 300 patients having mental illness have had prefrontal lobotomies performed here. Great caution is exercised in the selection of cases. The procedure has not been employed as yet for the treatment of pain. No sympathetic system surgery is done because of the insufficient number of beds and lack of operating time. As in most European Neurosurgical Clinics, the cranial surgery is done with local anesthesia, and intravenous fluids and blood are seldom given during the procedure. The brain surgery witnessed was done with meticulous care. Professor Krayenbühl's particular interest with neurosurgical lesions concerns the removal of cerebello-pontine angle acoustic neuromas. He placed great emphasis on carrying out operations conservatively so as not to cripple patients, believing it better to reoperate if necessary. During one clinical meeting both Professors Krayenbühl and Dorothy Russell, who is the neuropathologist of the London Hospital, recited experiences with carcinogenic dangers from thorotrast for cerebral angiography. Not only may the thorotrast initiate sarcomas in the liver as well as other organs having reticulo-endothelial tissue but "thorotrast tumors" will form beside the carotid artery at the site of injection.

---

*Titrud, Leonard A.: Impressions from European Clinics. Minn. Med., 32:811-814 (Aug.) 1949.

Professor Albert Jentzer is chief of surgery at the University of Geneva in Switzerland. Although a general surgeon, he does the necessary neurosurgery. In his absence, Doctor Horace Barbey was in charge of the surgical department. A formal neurosurgical division has never developed in Geneva. The University's teaching hospital is the Hopital Cantonnal which has twenty-five of its 200 beds for patients with neurosurgical problems. Although most types of neurosurgical procedures are done here, this field does not occupy a particular place of prominence or interest. Much traumatic neurosurgery is done and most of the additional work is that of necessity.

Paris has been a place of importance in original neurological and neurosurgical thinking and research for a long time. Unfortunately, the difference existing between the French and English languages has provided a constant barrier against a full and common understanding of many important advances in medicine and surgery. The University of Paris has about 8,000 medical students and the senior classes usually average about 600 students. There are considerably smaller medical colleges located in Bordeaux, Lyons and Marseilles. Therefore, Paris has developed as the center of medical teaching in France and this is particularly true in neurosurgery with its eight trained neurosurgeons.

The premature death of the famous Clovis Vincent resulted in his renowned neurosurgical clinic at the Hôpital de la Pitié to come under the able direction of a general surgeon who is also gifted in neurosurgical work, Professor Petit-Dutaillis. Doctor Gerrard Guiot, assistant to the chief, accomplishes much of the clinical work here; he is an excellent surgeon. This clinic is one of the largest in France and has about 130 neurosurgical beds. In addition to a modern operating suite having two air-conditioned operating rooms, the clinic's own x-ray facilities are also centrally located. An older and adjacent operating suite serves as an auxiliary unit. A great deal of tumor surgery is done on this active service. All of the intervertebral disk surgery of this large hospital is done by the neurosurgeons. Spinal fusion is almost never done for these patients. Prefrontal lobotomy for mental disease and sympathetic surgery for hypertension have not been done extensively here. Their results for relieving intractable pain have been much better after rhizotomy or tractotomy than after prefrontal lobotomy.

Doctor Guiot informed me that Professor Petit-Dutaillis observed the existence and location of sensory nerve tracts in the brain stem and midbrain about 25 years ago. This information led him toward the perfection of high cervical cordotomy for obliterating intractable pain in the upper extremity. It was learned that the fibers of the spinothalamic tract concerning the upper extremity are in the extreme anterior part of the spinal cord, extending quite medially in the upper cervical segment. The sensory fibers for the lower part of the body are directly behind these. It was found that transecting this pain tract at the third or fourth cervical segmental level was dangerous because of respiratory disturbance. Therefore, the operation is performed quite safely now at the first or second cervical segmental level; and done with local anesthesia so as to make sensory tests possible during the cordotomy. Over the years, approximately 100 patients have been treated with this procedure. The staff believes that midbrain tractotomy and prefrontal lobotomy are much less satisfactory methods than cervical cordotomy to free the upper part of the body from pain.

Cerebral arteriography has reached a high level of perfection at this Neurosurgical Clinic of Professor Petit-Dutaillis, particularly because of the diligent work of Doctor Pierre Sergent. He has performed 500 to 600 carotid and about thirty vertebral arteriograms at the rate of nine or ten a week. These injections are all percutaneous and he observed that it is easier to do a vertebral than a carotid angiogram. He learned that with carotid filling, the circulation in the posterior and basilar part of the brain almost never appears on the x-rays. Likewise, vertebral arteriography almost never outlines the carotid circulation. Doctor Sergent has done extensive anatomic postmortem studies of the blood circulation of the brain. He has been impressed particularly by the frequent arterial variations of the basilar circulation as well as many peculiarities in the collateral circulation in the brain. His work which is being published will be a valuable contribution.

Another famous neurosurgical clinic is in the historic Hôpital de la Salpétriere under the direction of Professor Jean Guillaume and his able assistant Doctor Gabriel Mazars. There are about fifty neurosurgical beds at this hospital which also houses an outstanding department of medical neurology. Guillaume and Mazars carry on additional work at the Clinique Montagne and Clinique Moliere which each has about forty neurosurgical beds. Their neurosurgical team operated on approximately 800 brain tumor patients last year. Additionally, an unusually large number of prolapsed intervertebral disks were removed. They have done about 80 cortical excisions for focal epilepsy with favorable postoperative results. The wife of Doctor Mazars has contributed greatly in this work because of her skill in localizing the epileptogenic areas and particularly by her interpretation of the many electro-encephalograms. Their work in this field is outstanding in France; and at the present they are preparing a publication concerning the surgical treatment of epilepsy.

Guillaume and Mazars favored posterior rhizotomy in the treatment of the pain of angina pectoris. They carried out very few sympathectomies for hypertension or peripheral-vascular disease. During the past three years they have had a series of about eighty patients for whom they performed cervical cordotomy for pain relief. Prefrontal lobotomy is not favored particularly as a means of eliminating pain. It should be emphasized that cervical corotomy is employed only for treatment of intractable pain in the upper part of the body; the standard thoracic cordotomy is generally employed to eliminate pain in the pelvis and lower extremities. Mazars stated that they had unusually good luck in evacuating intracranial hematomas and even in securing hemastasis in some of the apoplectic cases; this neurosurgical procedure has certainly not been developed in the United States.

Jacques LeBeau, who worked with Clovis Vincent at the Hôpital de la Pitié, now directs the neurosurgical clinic at the Hôpital Boucicout. J. B. Tavernier is associated with LeBeau. There are only fifteen neurosurgical beds at this hospital which is one of the medical teaching units associated with the University of Paris. LeBeau is engaged also in a vast private practice and expects to have approximately eighty neurosurgical beds in a new hospital on the outskirts of Paris by 1951. The neurosurgical work carried out at the Hôpital Boucicout is much the same as elsewhere. LeBeau has had impressive results with cortical excision of Brodmann areas nine and ten for mental illness as well as for pain relief in cases of malignancy in that these patients had no debilitating postoperative personality alteration. He was somewhat hesitant about carrying out high cervical cordotomy bilaterally because of risk from bleeding in the spinal cord and disturbance of other than the spinothalamic tracts.

M. David is the chief neurosurgeon at the busy clinic of the Hôpital Psychiatrique Sainte-Anne. A great deal of anatomical research has been done here regarding the thalamus and adjacent hypothalamic structures. At the present, the clinic is being rearranged for greater facility. M. R. Klein who spoke at the Zürich meeting about the treatment of hydrocephalus confines his neurosurgical work largely to children. His clinic is at the Hôpital Necker Enfants Malades.

Professor Paul Martin is head of neurosurgery at the University of Brussels in Belgium. There are about thirty neurosurgical beds in this modern unit. In addition to the general neurosurgical work done, there was a special interest here in the surgical treatment of focal epilepsy. The cases were studied thoroughly on the neurological service. Electro-encephalographic records were being repeated frequently. Professor Martin emphasized that at least three years must pass without recurrences of seizures after excision of the epileptogenic cortical area before any thought of cure can be entertained. He has observed marked generalized dysrhythmia on electro-encephalographic records more than a year after removal of the cortical scar.

Certainly one of the outstanding neurosurgical centers of Europe is that of Professor Edvard A. V. Busch at the Kebenhavns Militaerhospital, Copenhagen, Denmark. This is a teaching unit of the University and has sixty neurosurgical beds.

The buildings are of a military cantonment type, the main structure being two stories. There are two large and quite modern air-conditioned operating rooms with an adjacent electro-encephalographic laboratory. Each operating room is equipped with a large portable x-ray machine having a Lysholm head attachment for ventricular and cranial x-rays as well as for cerebral arteriograms. Plans have been made for the construction of a new building with three operating rooms. It is expected that the neurosurgical clinic will remain in this military hospital for the next ten to fifteen years.

At the present, there are ten resident physicians training in neurosurgery here. Except for Doctors Lara of Argentina and Uwǎng of Formosa, the remaining are Danes. Doctor Broager carried on most of the clinical and operative work under Professor Busch. Busch has trained five neurosurgeons who hold responsible positions throughout Europe now. His present clinic has been a development over a period of seventeen years.

This is an extremely busy clinic. During the past year, 214 brain tumor operations were done here. Over the years, a series of almost 2,000 prolapsed intervertebral disks have been operated upon. There is great enthusiasm here in sympathectomy for hypertension; and also in prefrontal lobotomy for mental illness.

Professor Busch favors the bilateral supradiaphragmatic sympathectomy of Peet in relieving hypertensive symptoms such as severe headaches, particularly in the age group of about sixty years. However, he does not believe this operation is very effective in lowering blood pressure. For patients of about this age who are better operative risks, the thoracolumbar sympathectomy of Smithwick is favored. These individuals have the two sides operated upon within about ten days during the single hospital stay. Professor Busch has carried out a more radical sympathectomy approaching the thoracic trunks by the removal of portions of the sixth and the eleventh or twelfth ribs. The sympathetic trunks are removed from the fourth thoracic to the first lumbar segmental levels. More than 100 patients have had this operation during a two-year period; and it is believed that this procedure reduces the blood pressure more than the other types of sympathectomy. This form of procedure is preferred to Poppen's technique of removing the sympathetic trunk from the fourth thoracic to the fifth lumbar level because the operative shock and postoperative fatigue are less.

Most of the neurosurgical operations are done with local anesthesia here as in other European clinics. This seemed to be quite adequate for craniotomies but not for sympathectomies or spinal surgery. Bilateral prefrontal lobotomy was employed for the relief of intractable pain. All lobotomies were preceded by cisternal ventriculograms. Alcohol root injection was usually used for trigeminal neuralgia; although at times the mandibular division was electrocoagulated. If the pain recurred, then temporal trigeminal rhizotomy was done rather than the medullary tractotomy of Sjöquist which was considered more dangerous.

The surgical technique was excellent and the procedures were done with dispatch. Very adequate decompression was accomplished in cases of malignancies of the brain. Angiography was used extensively to localize cerebral lesions. If the angiogram revealed a pattern of great vascularity as that of a meningioma and the patient was not in emergent need of cerebral decompression, then x-ray therapy was given over a two- to three-week interval with a total dose of 2,000 to 3,000 roentgens in approximately 15 treatments in order to thrombose many of the vessels and greatly reduce the blood loss of tumor removal. Postoperative x-ray therapy is used only in selected cases as pituitary adenomas, cerebellar tumors of children, and certain midbrain lesions.

Professor Norman M. Dott directs the neurological surgery service at the Royal Infirmary, University of Edinburgh in Scotland. During his convalescence from an orthopedic operation, F. J. Gillingham administered the department. Sir James Learmonth is the chief of surgery at the University. Professor Learmonth has a great interest in peripheral-vascular disease and therefore the majority of the sympathetic surgery is done on his general surgery service.

Most of the neurosurgery is done at the Royal Infirmary at the present where the service has twenty beds. After a few convalescent days, the patients are transferred to Bangour, about 20 miles from Edinburgh, where eighty-five neurosurgical beds are available in a large mental hospital. Surgical facilities are now being installed in the Bangour Hospital so that operations may be done there also. A new building addition has been planned for the neurosurgical service at the Royal Infirmary.

In the Royal Infirmary, the service has two rather small and well-equipped operating rooms for the service. X-ray facilities and a separate electro-encephalogram room containing a four-channel machine are easily available. Neurosurgery is an extremely busy service here also and about 100 patients remain on the waiting list constantly for admission. Approximately 150 patients having brain tumors were operated upon last year. Because of necessity, most of the operations done are for brain tumors. Percutaneous angiograms are used commonly for diagnosis and localization. A large number of prolapsed intervertebral disk cases are operated upon; and very few spinograms are done.

The type of surgical procedure carried out for various problems is much the same as throughout the United States. As contrasted with the Continental Clinics, intratracheal anesthesia is used popularly throughout Scotland and England. A sitting position for the patient is maintained during posterior fossa cranial surgery as well as for the trigeminal rhizotomies. It was interesting to observe that while a ventriculogram is being done in a sitting position, a spinal needle is inserted in the lumbar canal for air injection so that the lower limits of the tumor may be determined from the x-rays taken. For more than eight months now, preoperative exsanguination of brain tumor patients has been done and has proven worth while. This procedure is particularly helpful in the event of vascular tumors and when the intracranial pressure is high. As much as four pints of blood is removed from the radial artery and then citrated to be ready for administration to the patient after the surgery. During the operation, the blood pressure may be about 80 mm. of mercury; the pulse as fast as 130 to 140 per minute; and the respiratory rate at 40 to 50. It is extremely important to have a high oxygen concentration administration intratracheally during this period when the circulating blood volume is decreased. During the operation, the mass of the brain is reduced and the bleeding problem of tumors is simplified. There had been no ill effects from this procedure at this clinic and the staff uses it enthusiastically.

Cerebral angiography is frequently done here. Professor Dott has a great interest in developing a surgical treatment for aneurysms of the posterior or basilar circulation; and for this reason vertebral arteriograms are done often. It was interesting to learn that favorable results had been obtained from unilateral prefrontal lobotomy done on the dominant side for the treatment of intractable pain. The operative care of brain tumors seemed to follow the standard pattern. Radiation therapy for these lesions is not used much.

The National Hospital for Diseases of the Nervous System in London was visited during this tour again. This is actually the largest clinical British postgraduate center for neurology and neurosurgery. Sir Charles Symonds directs the neurological division. Wylie McKissock is the chief of neurosurgery and is aided by Harvey Jackson. All of the medical staff here are of the graduate school status or higher. This is in contrast with other teaching hospitals of London which are concerned largely with the medical undergraduates as well as with those studying in the specialties. Many of the doctors who come here for their advanced training in neurosurgery are already qualified by the Royal College of Surgeons in general surgery. The neurosurgical service here has forty-five beds. The facilities are very modern; and there are two air-conditioned operating rooms. There are four graduate fellows on each of the neurological and neurosurgical divisions. Very few psychiatric patients are cared for in this hospital which has a total bed capacity between 200 and 300.

Mr. McKissock was on vacation during this visit, leaving Mr. Jackson in charge. Except for the vacation periods, McKissock operates here three days a week, and Jackson operates during two days. Approximately 350 brain tumors a year are operated upon here. Intratracheal anesthesia is used extensively. The preoperative exsanguination as carried on at Edinburgh is not favored because of fear of cerebral anoxia.

The Smithwick operation for hypertension is standard here. Alcohol root injection is used for trigeminal neuralgia prior to consideration of rhizotomy. The transtemporal operation is the one done if necessary. The trigeminal tractotomy of Sjöquist done in the brain stem is not carried out except in special cases because this staff is as hesitant as that at Edinburgh because of the complications. It was a pleasure to see how expertly trigeminal rhiztomy was done here with local anesthesia in the debilitated and aged patients. Prefrontal lobotomy has not met with favor here as a means of obliterating intractable pain. However, this procedure is employed extensively for mental disease and the Freeman-Watts technique is used.

The impression gained after visits to this hospital during two different trips is that the neurosurgical work done is fast and excellently carried out. A great practical sense is used in dealing with the various problems. It is definitely one of the better places for a touring student to stop.

Professor D. W. C. Northfield is the head neurosurgeon at the London Hospital. There are about fifteen adult neurosurgical beds and an additional variable number of patients are on the neurological, pediatric, and general surgical services. In addition, there are about twenty neurosurgical beds at the country annex hospital at Brentwood which is chiefly a children's hospital.

There are four active operating days a week at the London Hospital. About seventy-five to 100 brain tumor patients are operated upon each year. The one operating room, although not modern, is well equipped. The prolapsed intervertabral disk surgery and various types of sympathectomies are done on this service. The staff had changed from the more radical thoracolumbar sympathectomy of Poppen to that of Smithwick. In the treatment of trigeminal neuralgia, injection of alcohol was made into the gasserian ganglion. When pain recurred, the transtemporal trigeminal rhizotomy was done. Professor Northfield had reluctance about using the Sjöquist tractotomy except in special instances. During this visit Professor Northfield operated upon his sixth case of frontal osteoma. The patients having this rare condition ordinarily come for medical aid because of empyema of one of the sinuses. Skull x-ray examination reveals both the presence of a sinus opaque because of empyema as well as an osteoma growing into the sinus to prevent the outflow of drainage. The osteoma ordinarily tends to grow from the floor of the frontal or ethmoid sinuses and pushes the sinus mucosa during its growth. He emphasized the great need for immediate removal of these lesions to prevent the effects of progressive intracranial infection.

Sir Geoffrey Jefferson is the professor of neurosurgery at the Manchester Royal Infirmary. This is a free hospital that serves a densely populated industrial and farming area; and is an excellent teaching institution. The neurosurgical bed capacity is quite limited with 17 for females and 15 for males. This limiting factor has caused the neurosurgical patient waiting list for admission to increase to a present number of about 450. The operating theater is used for four days each week. It was estimated that between 150 and 200 brain tumor patients are operated upon here each year.

In addition to Professor Jefferson, there are five members of the neurosurgical attending and house staff. A modern air-conditioned operating and x-ray suite has just opened here. One large room and two small rooms are employed for surgery. The entire unit is on the ground floor and is very practically arranged. Most of the patients are housed in two large wards, and some small adjacent rooms. Most of the diagnostic work is done on the neurosurgical service. An entire afternoon each week is used for seeing outpatients. Professor Jefferson attends this clinic and examines many of the patients himself taking great pains to be instructive about many puzzling problems. This was one of the most impressive teaching clinics visited on this tour.

Because of the large surgical load, most of the operative procedures are for the tumor patients. An extensive use is made of carotid angiography for localization. Obviously malignant gliomas of the brain diagnosed by the typical vascular pattern on cerebral arteriography or biopsy done through a cranial trephine hole are not operated upon with a formal craniotomy and the removal of a large amount of the tumor. It has been found more valuable to employ the few available beds for patients with more curable conditions. The prolapsed intervertebral disks cases are operated upon by the neurosurgeons. The sympathetic system surgery is done on the general surgical service.

The surgical technique was meticulous. The various operative procedures done were much the same as in the American Clinics. Intratracheal anesthesia was used principally for the cerebellar operations. Most of the cerebral surgery was carried out under general anesthesia because it was believed that rebreathing through the intratracheal tube caused increased intracranial pressure. Spinal anesthesia was used in prolapsed disk surgery. Dr. Hunter of the anesthesia department employed venous pressure measurement rather than the recording of arterial blood pressure and pulse rate to ascertain the condition of the patient during surgery. He has found that the changes in venous pressure reflect more quick-

Case Report

THE EFFECT OF SOME OF THE USUAL CARDIAC DRUGS IN REGARD TO AN INTERMITTENT DELAYED INTRAVENTRICULAR CONDUCTION

HENRY L. ULRICH, M.D. and GASTON SAUVE, M.D.
Minneapolis, Minnesota

M. K., aged fifty-two, a paperhanger and painter, and a highly nervous individual, reported in August, 1950, to the private office, with the following complaints: Since March, 1950, he had had a heavy feeling or congestion in his chest when walking against the wind or after severe exertion. He experienced dizzy spells particularly when waking up in the morning. There was a weight loss of 20 pounds in two months.

His family history was noncontributory except that his father died at seventy-nine of heart failure. His past history elicited three attacks of pneumonia in his adolescence and tonsillectomy at age eleven. He is married; the wife is healthy, and two children are living and well, the younger aged twenty-seven.

In August, 1950, physical examination was practically negative with the exception of blood pressure which read 180 over 100. His blood, urine and electrocardiogram were normal. Renal function was normal. X-ray examinations showed the gastric tract to be normal and functional test of the gall bladder gave normal results. On the day he left the office, in August, he had been injured in a collision with an automobile. The left elbow and left knee were traumatized. The patient was badly shaken up. Following this accident he took a rest of two weeks and in an attempt to go to work he found it was impossible to do so. He was then hospitalized for rest and observation. On admission at the hospital, no new findings were determined except that he was unduly nervous, exhibited variable blood pressure readings, although completely at rest, also anginal symptoms. His electrocardiogram now showed delayed intraventricular conduction resembling right bundle branch block in all leads and distributed irregularly or intermittently between normal complexes (Fig. 1). The house officer (G.S.) became very much interested in this variation of conduction. After several observations, it occurred to us that we might use serial readings to observe the action of different drugs given usually to patients with coronary insufficiency or infarction. The problem that presented itself was that we were dealing with a case of coronary insufficiency which had an area or focus of ischemia or fatigue in the myocardium; this area functioned normally for a few cycles and then again abnormally for a few cycles. The anatomical area of this focus was assumed to be on the septum along the right bundle.

The drugs used were nitroglycerine; oxygen by Boothby's masks, ninety minutes; aminophyllin 3½ grains intravenously; oxygen for twenty-four hours in a tent; papaverine grains 1 intravenously; 1 ounce of brandy orally; atropine grain 1/100 subcutaneously. There were two physical tests, valsava and exercise.

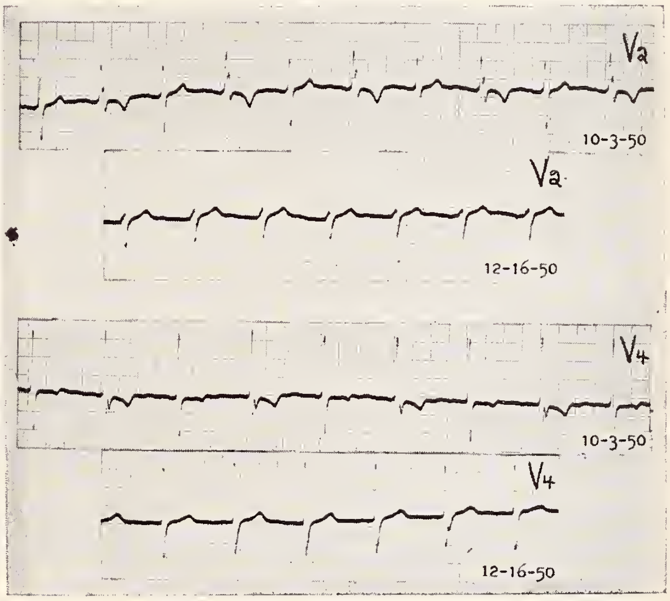

Fig. 1. These tracings illustrate clearly the intermittence of the intraventricular conduction defect as well as the improvement over a period of two months' rest.

We cannot draw any conclusion from these observations. They are reported to call attention that occasionally the opportunity arrives such as this one in which the effect of drugs can be studied at the bedside rather than in a laboratory.

We can call attention to the fact that during the period of observation (see the protocol and charts), this man's conduction system improved with rest (Fig. 2); that oxygen, aminophyllin, nitroglycerine and papaverine modified temporarily the conduction system in this man.

No correlation can be seen between the rate and the constancy of the one-to-one ratio or the disappearance of the abnormality in the ventricular conduction; but at a rate of 62 per minute or less, the so-called BBB is always absent, and likewise the ratio of one-to-one is constant at the rate of seventy-five per minute.

These observations corroborate the clinical concept

Dr. Ulrich is Visiting Physician to Northwestern Hospital, Minneapolis.

Dr. Sauve is House Physician, Northwestern Hospital.

that these drugs are of value temporarily, if not permanently, in the treatment of coronary disease.

Protocol*

August 11, 1950—Normal E. C. G.

Sept. 27, 1950—Rate 71/min. Right BBB?—Intermittent. The ratio of normal complexes to abnormal ones is inconstant. The so-called normal complexes show a positive T in V leads.

Sept. 28, 1950—Rate 88/min. Tracing taken while the patient had a retrosternal anginal type of pain, as well as after a nitroglycerine tablet, gr. 1/100 had been given S. L. Intermittent right BBB with inconstant ratio. V2-3-4 showed a positive T in the so-called normal QRS pattern until 8 minutes after cessation of pain by the nitroglycerine at which time they all became negative. The QRS complexes of V 2 also became more notched 8 minutes after cessation of pain.

Sept. 29, 1950—Rate 75/min. Intermittent right BBB with constant ratio of 1 to 1. T 1 of normal patterns is now isoelectric. The ratio of 1 to 1 was changed to an inconstant one by having the patient take a deep breath. T V 4 is now deeply negative. While patient was feeling well, a nitroglycerine tablet gr. 1/100 was given S. L. and tracings and B.P. were taken simultaneously 15 seconds—1 min -2-3-8 minutes after and no appreciable changes in V 4 and the B.P. were noted.

Sept. 30, 1950—Rate 83/min. BBB constant at a ratio of 1 to 1. In the so-called normal complexes TV 1 diphasic TV 2 -V3 still negative and TV 4 less negative than on Sept. 29, 1950.

Oct. 1, 1950—Rate 75/min. BBB constant at a ratio of 1 to 1. TV 1 and TV 2 diphasic. TV 3 less negative than on Sept. 30, 1950. TV 4 now diphasic.

Oct. 2, 1950—Rate 83/min. BBB constant at a ratio of 1 to 1. TV 1 and TV 2 now positive. TV 3 now diphasic. After 1½ hours of O_2 by Bt. B. Mask—6 liters (Rate 71). The only BBB present are seen in Lead III (Rate 75). No remarkable changes in T waves.

Oct. 3, 1950—Rate 75 to 83/min. BBB still constant at a ratio of 1 to 1. TV 3 — TV 4 still diphasic. The V 2 lead was taken before I.V. injection of aminophyllin grs 3.¾ and at the following intervals: during injection as well as 2-3-4-5 and 10 minutes after. Rate 10 min. after I.V.—60/min. TV 2 was positive until 2 min. after injection at which time it became diphasic. The BBB disappeared 5 min. after injection and was still absent 10 min. after.

Oct. 4, 1950—Rate 62. This E. C. G. was recorded after patient had been in O_2 tent for 24 hours—8 liters. No BBB noted. TV 4 again became negative.

Oct. 5, 1950—Rate 70 to 75. BBB disappeared by having the patient hold his breath in deep inspiration (rate 65). Papaverine grs. 1 was given I. V. and tracings were taken at the following intervals: during I. V. 1 Min. -2-3-7-20-21-22 minutes after. The BBB disappeared after 7 minutes (rate 63) until 21 min.—at which time it recurred (rate 68) and again was not recorded on the "22 Min" tracing (rate 68).

Oct. 6, 1950—Rate 75. BBB still present at a ratio of 1 to 1. A tracing was taken 30 min. after ingestion of one ounce of 84 per cent proof brandy and no changes were observed. Rate after -75.

Oct. 7—Rate 65. Patient had a precordial dull pain at 8:30 A. M. and a nitroglyecrine tablet gr. 1/100 was given S. L. This tracing was registered at 11:45 A. M. BBB is very inconstant and is present for a few beats in leads AVR-AVL-V 1-V 2-V 3, TV 4 is less negative than on Oct. 4, 1950.

Oct. 8, 1950—Rate 68. BBB disappeared spontaneously in lead AVL-AVF -V 1 and part of V 2. TV 4 now diphasic. Immediately following this tracing, the following test was done—Atropine SO_4 gr. 1/100 was given S. C. and recordings were taken at the following intervals: 2 sec. after—2 min. after 4-5-10-12-14-16. The BBB disappeared after 5 min. (rate 62) and reappeared in the 12 min. tracing and was constantly present at a ratio of 1 to 1 from 14 min. (rate 71) thereafter.

Oct. 10, 1950—Rate 75. BBB constant at a rate of 1 to 1. TV 4 still diphasic.

Oct. 11, 1950—Rate 83. Patient had been walking intermittently for a half hour. BBB constant at a ratio of 1 to 1. TV 4 still diphasic.

Oct. 14, 1950—Rate 79. Patient had been up and around for one hour. No changes.

Oct. 15, 1950—Patient discharged from hospital.

Dec. 16, 1950—Rate 83-88. BBB inconstant. Tracing taken 2 months after restricted activities, no work permitted.

Acknowledgment

We are grateful to Mr. Russell Nye, Superintendent of the Northwestern Hospital, for sanctioning some of the expense of this study.

History of Medicine In Minnesota

MEDICINE AND ITS PRACTITIONERS IN OLMSTED COUNTY PRIOR TO 1900

NORA H. GUTHREY
Rochester, Minnesota

(Continued from the March issue.)

In the maintenance of public health and welfare through preventive medicine Dr. C. H. Mayo played a major part. Throughout his career he was a proponent of dentistry, recognizing that dental infection often is the cause of general systemic infection and of disease; because of his untiring work he was recognized by honorary membership in the great dental societies. From 1900 he was for many years a member of the Minnesota State Board of Health, during which he worked for legislation to further the purposes of public health. From May 1, 1912, until he resigned after twenty-five years of able work, he was health officer or a member of the Public Health Commission of Rochester, directing its work in relation to tuberculosis, undulant fever and other diseases carried by contaminated milk and other foods. He aided in securing the first modern sewage disposal plant of Rochester, one of the first of such plants in the state. A novel contribution concerned with the collection and use of garbage was his purchase and presentation of the hog farm to the city of Rochester. By selection and feeding of garbage collections from city residences and institutions, it has been possible to raise feeder pigs, the income from which has contributed in large measure to the support of the public health work in Rochester.

The name of Mayo for more than eighty years has been identified in Rochester with civic improvement. When the long-envisioned Mayo Civic Auditorium was to become a reality (1938-1939) and Dr. Charles H. Mayo reluctantly allowed his name to appear as donor, with the Mayo Properties Association and without the specified name of his brother, Dr. William J. Mayo, he made his attitude clear; on July 28, 1939, when he spoke at the laying of the cornerstone, he said, "I wish to say, first of all, that the gift is a family affair," and proceeded to explain his brother's part.

The unity of the Mayo brothers cannot be overvalued. Not long after Dr. W. J. Mayo gave up surgery, Dr. C. H. Mayo relinquished the work because of failing health, and it was obvious that the two found comfort in the fact that they shared this partial retirement.

Dr. C. H. Mayo with his brother established the Mayo Foundation for Medical Education and Research, in affiliation with the University of Minnesota, and a few years later the brothers created the Mayo Properties Association; the function of the two organizations is a matter of public record. When changes in administrative policy were indicated in the clinic and foundation, the brothers were in accord.

Although in the last years of his life a succession of illnesses so reduced

Dr. C. H. Mayo's strength that he was obliged to withdraw from his former activity, he came daily to the clinic when he was able, visited all departments informally and was accessible to the many who wished to see him. In the late spring of 1939 he went to Chicago and it was there, after overexertion, that he succumbed to pneumonia, at the Mercy Hospital, on May 26. He died without regret, happy in the devotion of family and friends and in the knowledge of work well done. He had lived abundantly.

On July 26, 1943, Edith Graham Mayo, aged seventy-two years, died at St. Mary's Hospital, Rochester, after a long illness. The death of the younger son, Dr. Joseph Graham Mayo, had occurred seven years previously, by accident, on November 9, 1936.

In 1947 the survivors of Dr. Charles Horace Mayo were a son, Dr. Charles W. Mayo, of Rochester, Minnesota; four daughters, Dorothy Mayo and Louise Mayo (Mrs. L. Arlin) Elwinger, both of Rochester, Edith Mayo, wife of Dr. Fred W. Rankin, of Lexington, Kentucky, Esther Mayo, wife of Dr. John B. Hartzell, of Detroit, Michigan; an adopted daughter, Marilyn Mayo (Mrs. Ralph S.) Mason, in California; and a foster son, John Nelson, of Johnson City, Tennessee. There were twenty-four grandchildren.

Dr. Charles W. Mayo, with the Mayo Clinic since 1927, is head of a section in surgery in the clinic and professor of surgery, the Mayo Foundation; during World War II he served as colonel in the Medical Corps of the Army of the United States, first as unit director of the 71st General Hospital, and subsequently in other hospitals, general and station, all affiliated units of the Mayo Clinic in New Guinea and the Philippine Islands, and as consulting surgeon to the Army Forces of the Western Pacific. Dr. Fred W. Rankin was with the Mayo Clinic from 1916 to 1933, the last seven years as head of a section in surgery; since 1933 he has been in Lexington, Kentucky, chief surgeon to St. Joseph's Hospital of that city; during World War I he served as major with the American Expeditionary Forces; during World War II he served in uniform nearly four years, with the grade of brigadier general, as chief surgical consultant to the Army of the United States; he has the Distinguished Service Medal and is entitled to ribbons for service in various theaters of the war; he was wartime president of the American Medical Association. Dr. John B. Hartzell entered the Mayo Foundation in July, 1927, as a transfer fellow in surgery from the Graduate School of the University of Minnesota; since October, 1930, he has been practicing in Detroit, Michigan; he is assistant professor of clinical surgery, Wayne University College of Medicine, director of surgery, the Charles Godwin Jennings Hospital, and attending surgeon, the Receiving Hospital; during World War II he served as commander in the United States Navy, in naval hospitals in the United States and as medical officer aboard an attack transport with the Amphibious Force in the South Pacific.

Simeon Paul Meredith (1852-1930), homeopathic physician, a graduate of the Hahnemann Medical College and Hospital, in Chicago, was from 1882 until his death a respected practitioner and citizen in various places in southern Minnesota: Austin, Grand Meadow, Spring Valley, Pleasant Grove, Windom, Garden City and Mankato. Full biographical notes on Dr. Meredith appeared in a history of medicine in Fillmore County prior to 1900 (Guthrey). Dr. Meredith held an exemption certificate in Minnesota.

The present entry serves to establish Dr. Meredith's association with Olmsted

County. In February, 1899, he removed with his family from Spring Valley, Fillmore County, where he had spent ten years, to Pleasant Grove, to assume the practice of the late Dr. Marshall T. Bascomb, who had died on January 28, 1899. He succeeded Dr. Bascomb as county physician for the village and the township of Pleasant Grove. In the autumn of 1902 he left Pleasant Grove for Grand Meadow, Mower County.

Dr. Meredith died at his home in Mankato on September 1, 1930, after many years of failing health.

Melvin C. Millet (1868-1907) was born on September 22, 1868, in Sumner Township, Fillmore County, near the village of Hamilton, the son of Mr. and Mrs. Roscoe G. Millet. He had two sisters, Rose and Roby, and one brother, Frank.

Melvin C. Millet spent the first twenty-one years of his life in Sumner Township, attending district school and working on his father's farm. In his twenty-second year, determining on professional education, he began two years of study at the Winona Teachers College, on completion of which he taught district school one year. In 1892, on the advice of his uncle, Frank W. Millet, of Rochester, and with the encouragement of Dr. Rollo C. Dugan, of Dover, Olmsted County, he read medicine for one year with Dr. Dugan and accompanied the doctor on country rounds, both as driver of the horses and as clinical observer. In the autumn of 1892 he entered the medical school of the University of Minnesota, from which he was graduated with high honors in June, 1895; he was licensed by examination in Minnesota on June 11, 1895, receiving certificate No. 529 (R).

The scene of Dr. Millet's first medical practice was Dover, a typical New England village set down in the Middle West, the opening having been held for him by Dr. Dugan, who had removed to Eyota in 1892, when Dr. A. W. Stinchfield left Eyota to join the Drs. Mayo in Rochester. Dr. Stinchfield has been quoted as saying that the community was "too rascally healthy" to make Dover a profitable location for medical practice and so Dr. Millet found it. After a year and a half he joined his old friend and college classmate, Dr. Milan J. Hart, who had been a Dover boy, in partnership in Le Roy. In late 1898 the Drs. Mayo, Graham and Stinchfield invited Dr. Millet to join them as resident physician at St. Mary's Hospital, in Rochester, and in November of that year he became a member of the staff.

A man of fine character and intellect, warm and sympathetic humor and sound training, Dr. Millet soon became one of the physicians in charge, and in the few remaining years of his life achieved a record of sincerity of purpose and scientific accomplishment. Although one of his first and least congenial tasks at St. Mary's Hospital was to record operative findings, with clinical notes, in the huge ledgers then used as case books, it was his diagnostic ability together with his knowledge of physiologic chemistry and his skill in the technic of gastric analysis that had brought him to the attention of the Mayo group. In Rochester he not only continued his already notable work in analysis of gastric contents but also made a study of gastric ulcer and its differential diagnosis. Concurrently, in Dr. Millet's original work the section on urology of the potential Mayo Clinic had its beginning: he studied the possibilities of exact diagnosis in renal disease and was one of the earliest cystoscopists to use and advocate the direct-view cystoscope and was the first to apply the principles of a water medium in this type of cystoscope. Until a few months before his death he did all of the cystoscopic work, setting the high standard that afterward was maintained. His scientific papers, particularly those on renal disease and cystoscopy, attracted attention throughout the country and were perhaps the most precise and comprehensive to come from Rochester at that time. He had special interest in the diseases of children. Although Dr. Millet died before a formal section on pediatrics had been established in the clinic, he has been credited, with Dr. Henry S. Plummer (his second cousin), with recognition of changes that were coming and that should come in the treatment of the diseases of children; reminiscences preserve some of the comments of these two men on the subject. Dr. Millet still is recalled with affection and esteem for his devotion to his patients, especially to the little children in the wards. It is worthy of note that this man of practical background often said that the farming communities of the Northwest were the backbone of the group practice that soon was to be called the Mayo Clinic.

Dr. Millet became a member of the Southern Minnesota Medical Association in 1895, of the Olmsted County Medical Society in 1896 (once its secretary), the Minnesota State Medical Society in 1899 and soon afterward of the American Medical Association.

On June 12, 1901, Melvin C. Millet was married to Mary A. Frick, of Minneapolis, a daughter of Mr. and Mrs. Thomas W. Frick of that city. Dr. and Mrs. Millet had one son, Roscoe Frick Millet, who was born in Rochester on May 30, 1905.

When Dr. Melvin C. Millet died at his home in Rochester from Bright's disease on May 7, 1907, in his thirty-ninth year, his brilliant professional career had measured only twelve years. In his death the medical profession sustained an incalculable loss. Dr. Millet was survived by his wife, his son and his parents; two sisters, Rose Millet (Mrs. McGhie) of Fillmore County, and Roby Millet (Mrs. Austin) Kiser, of Glendive, Montana; and his brother, Frank Millet, of Salem, Oregon. Mary Frick Millet was married in 1911 to John L. Magaw, of Rochester; Mr. Magaw died in 1926. In 1950 Mrs. Magaw continued to make her home in Rochester.

Roscoe F. Millet followed in his father's profession and was graduated in 1930 with the degree of doctor of medicine from Northwestern University. He was a fellow on the Mayo Foundation, in Rochester, from July, 1930, to July, 1934. He was married to Lael Shea on October 9, 1934; Dr. and Mrs. Millet have two daughters, Margaret and Mary. Licensed in Illinois in 1938, Dr. Millet has practiced in Macomb, Illinois, since 1942. During World War II he was a lieutenant colonel on duty at the Mayo General Hospital at Galesburg, Illinois.

George Wilbur Moore (1870-. . . .) was the thirteenth appointee, as an assistant physician, to the staff of the Second Minnesota Hospital for Insane, at Rochester, Olmsted County. He came as an intern shortly after his graduation in June, 1892, from the medical school of the University of Minnesota, and when Dr. Eric O. Giere, an assistant physician, left the hospital to enter private practice, Dr. Moore was promoted to assistant physician. Within a week of his arrival in Rochester, by unanimous vote he became a member of the Olmsted County Medical Society. On his leaving the hospital in July, 1893, he was succeeded on the staff by Dr. Cyrus E. Eby.

Born at Moore's Hill, Indiana, on August 8, 1870, George Wilbur Moore was the son of Benjamin Franklin Moore and Florence Virginia Wilbur Moore. In boyhood he came with the family to Minnesota. He was graduated from the Central High School, Minneapolis, the University of Minnesota, and subsequently took postgraduate work at the Bellevue Hospital Medical College, New York. On leaving Rochester in 1893 Dr. Moore practiced medicine and surgery six months in Minneapolis before settling in Hatton, Traill County, North Dakota, where he remained three years.

From 1896 into 1934 Dr. Moore was in active medical practice in Hopkins, Hennepin County, Minnesota. On his retirement, on his birthday in 1934, the city and community of Hopkins honored him as a beloved physician and representative citizen. In 1946 he continued to make his home in Hopkins: a member of county, state and national medical associations; a Republican and past mayor of the city; long a worker for conservation of the forests and wild life of the state; a member of the Minnesota State League of municipalities, and of fraternal organizations, among them the Masons, Knights of Pythias and the Benevolent and Protective Order of Elks. His hobbies have been floriculture, gardening, fishing, hunting and travel.

Dr. Moore was married on June 27, 1894, to Charlotte E. Bell, of Minneapolis; of this marriage there were two sons, John Wilbur and Richard Watts Moore. A second marriage took place on February 22, 1906, to Emily Josephine Yeager, of St. Paul; there was one child of this marriage, George Wilbur Moore. This son and John Wilbur Moore were not living in 1946.

Frederick Richard Mosse (1855-1920) was for nearly fifty years a highly respected citizen and physician of Rochester, Olmsted County, and for many years of that period county coroner and city health officer.

Born near Sun Prairie, Dane County, Wisconsin, on November 1, 1855, Frederick Richard Mosse was the son of Ira Mosse and Eliza Love Mosse. He received his early education in the district school and the village school of Sun Prairie, in the latter of which he came under the tuition of Ellen Sabin, later the head of Milwaukee-Downer College, who helped and encouraged him. At the age of thirteen years he matriculated at the University of Wisconsin, from which he was graduated in 1874 with the degree of bachelor of philosophy. After a few months of study under Drs. Bowen and Ingman, of Madison, in 1874 he entered the Hahnemann Medical College and Hospital of Chicago. In 1876, when the Chicago Homeopathic Medical College was founded by a group of physicians who had withdrawn from the faculty of Hahnemann, he transferred to the new school, and from it, in 1877, received the degree of doctor of medicine. In later years he took postgraduate work at Rush Medical College and the Chicago Policlinic.

Immediately after graduation, in March, 1877, Dr. Mosse began practice in Rochester, with an office in the Graham Block on Broadway. After a few weeks he entered partnership with Dr. W. A. Allen, in offices in the Leland Block, at Broadway and Third Streets, a location that he retained although the partnership was dissolved on July 1, 1879.

In November, 1877, Dr. Mosse was elected coroner of Olmsted County, a capacity in which he served until 1910, with the exception of two terms, 1881-1882 and 1895-1896. In 1878, as city health officer, he began his active career in furthering public health: as secretary of the city board of health, 1883-1886; city health officer, 1887-1897; and member of the state board of health. For many years he was examiner for the Northwestern Life Insurance Company of Milwaukee and for the Travelers Life and Accident Insurance Company of Hartford, and he served a considerable time on the local board of the United States Bureau of Pensions.

Dr. Mosse was licensed in Minnesota on November 24, 1883, under the medical practice act of that year, receiving certificate No. 399 (H). Although in earliest years he practiced general medicine and surgery, he soon concentrated on internal medicine. As were his contemporaries, he was called on for special attention to catarrh, which he treated with atomizers, and to tuberculosis, for which, in the eighties, he used Bergeron's method of treatment. Soon after 1900 he became a member of the Southern Minnesota Medical Association, the Olmsted County Medical Society (on the proposal of Dr. Christopher Graham), the Minnesota State Medical Association and the American Medical Association.

A cultured, studious man, Dr. Mosse had a comprehensive library, was interested in collecting fine china, Indian baskets and pottery, and in growing beautiful flowers. He was a Republican, a charter member of Beta Theta Pi fraternity, an active member of the Knights of Pythias, and of the Congregational Church, and he was several times president of the Men's Sunnyside Club of Rochester. In the pre-automobile years of his widespread practice, from Rochester to Pine Island and to Chatfield, he kept sixteen horses, some of which were of racing stock, although most of them were sturdy roadsters. When roads were heavy or when epidemics of disease were current in the countryside, he sometimes employed a driver, but as a rule he preferred to handle the reins himself.

On January 12, 1881, Frederick R. Mosse was married to Flora L. Hurd, a native of Canada and daughter of Moses Hurd, who was born in Oneida County, New York, and Lavinia Hall Hurd, born in St. Catherine's, Ontario; Mr. and Mrs. Mosse came in 1856 to Rochester. Mr. Hurd was long a business man and civic officer of the community; he and his wife both died in 1892. Flora Hurd Mosse was a talented musician, prominent in the social and musical circles of the city. Dr. and Mrs. Mosse for many years, after 1888, made their home in their handsome brick house on Franklin Street. They had one child, Frederick Hurd Mosse.

Dr. Mosse died at his home on December 26, 1920, in the fiftieth year of his professional career. Reliable, conservative, kind, he has been characterized as always "there"; his patients never left him. He was survived by his wife, who died in 1934, and his son. Frederick Hurd Mosse, an architect of Rochester, was married to Inez Thompson, of Preston, Minnesota; Mr. and Mrs. Mosse have one daughter, Elizabeth Anne. During World War II Mr. Mosse served three years with the United States Army Engineering Corps.

Leland H. Munger, born in 1857, a graduate of the Medical College of Missouri in 1879, came from Stearns County, Minnesota, to Eyota, Olmsted County, in the spring of 1881 and established his home and office in a building opposite the schoolhouse. In commenting on the arrival, the *Rochester Post* stated that he had had a degree of experience in the profession that should recommend him to the people of that vicinity.

After a few months in Eyota Dr. Munger went to St. Charles and then to Winona, both in Winona County. Evidently he returned to Stearns County, for when he received state license No. 471 (R), on December 28, 1883, he was living in Fairhaven. Although the year has not been learned, sometime between 1890 and 1895 he again joined the medical profession of Winona and became a member of the Winona County Medical Society, and of the state and the national medical associations. His name appeared in the directory of the American Medical Association for the last time in the edition of 1912.

William Netter (1853-1933), a graduate of Rush Medical College in 1877, came to Rochester, Olmsted County, as physician and surgeon in the summer of 1878, and for his first few months in the city had office space with Dr. W. W. Mayo on Broadway. Early in 1880 Dr. Netter went abroad for a year's professional study in Munich and Paris, and on his return he again practiced in Rochester until March, 1882, when it was announced that he was removing to Minneapolis.

In notes on early decades of medicine in Winona County, however, it was stated that Dr. William Netter, from Rochester, settled in Winona in April, 1882, and also that a William Netter in the eighteen sixties had been engaged in the drug business with Dr. Wedel in Winona. William Netter, of the present sketch, was a boy in his early teens in the late sixties.

During his residence in Rochester the local newspapers mentioned Dr. Netter occasionally in relation to his various activities as practitioner; as member of the Scandinavian Literary Society, before which he occasionally gave declamations; as introducer, at Library Hall, of an atheistic speaker whose subject was "The man and the atheist in the struggle of life."

In January, 1883, the editor of the *Record and Union* of Rochester having received a call from Dr. Netter, commented that the doctor then was engaged in a thriving practice in Le Sueur. Notes on medicine in Nicollet County (unpublished, 1947) indicate that Dr. Netter was in Le Sueur only a few months. In the *Official Register of Physicians of Minnesota* of 1883-1890, Dr. Netter was listed as in St. Paul. According to the directory of the American Medical Association of 1906 he was licensed in Wisconsin in 1903, and there is evidence that from 1903 until his death he was a resident of Milwaukee.

Dr. Netter died at the Evangelical Deaconess Hospital in Milwaukee on July 20, 1933, of myocarditis, aged seventy-nine years.

Dr. Nichols, of uncertain professional rating, whose name appeared often in the newspapers of Rochester, Olmsted County, between 1860 and 1865, was one of the firm of Wheeler and Nichols, and later of Nichols and Cotter, stage proprietors, who ran a line of stage coaches from Brownsville, on the Mississippi River in Houston County, through Rochester and west to Mankato and Blue Earth City. This "doctor," frequently in Rochester, was at one time a resident of Albany, Wisconsin.

George W. Nichols, a graduate of the Vermont Academy of Medicine (Castleton Medical College) in 1861, came with his wife and family to Rochester, Minnesota, in the late summer of 1871 and remained nine years in active general practice. He first had his office and residence combined at the corner of Fourth and Main Streets; in November, 1872, he bought a home on the northwest corner of Prospect and Fourth Streets, where the city post office now stands (1947), and thereafter had his office on Broadway.

The consensus of those citizens of Rochester who recall Dr. Nichols is that he was "a nice man, a good doctor, an all around good fellow," who had an extensive practice. He is remembered as of medium height, rather stout, with brown eyes and light brown hair tinged with gray, and as genial, kindly and reliable. He and his wife were workers in the Methodist Church. Married in 1864, Dr. and Mrs. Nichols observed their tenth, or tin, wedding anniversary in Rochester on November 1, 1874, when their friends presented them "with everything in the line of tinware." Mention has been observed of two children of the family, a little daughter Edith, and a son who was born in Rochester on July 18, 1872.

Soon after his arrival in Rochester Dr. Nichols was elected to membership in the Olmsted County Medical Society (its secretary, 1874) and became a member of the Minnesota State Medical Society at the fourth semi-annual meeting, which was held at Rochester on June 11 and 12, 1872. In the autumn of 1874 he was elected coroner of Olmsted County and was still in office when he left the city in June, 1880; he was replaced as coroner by Dr. E. T. Sedgwick. Dr. Nichols was a county physician, also, and from April, 1875, into 1880 he was a member, sometimes the secretary, of the city board of health. He was active in the Independent Order of Odd Fellows and in Ashlar Lodge No. 23 of the Ancient Order of United Workmen; in January, 1878, as a retiring officer of the latter society, he was the recipient of a handsome goldheaded cane.

In July, 1878, the *Rochester Post* described in detail Dr. Nichols' new carriage: "A Dexter side-spring phaeton with a roomy top; a suitable box beneath the seat will accommodate the side curtains and the useful rubber lap blanket. On the dash, directly in the center is firmly fixed a physician's lamp with a powerful reflector of an improved design, calculated as a light unto the doctor as he meanders over countless mudholes. The carriage is well built, and judging from the short whirl we took in it behind the doctor's fiery horse Dan it is as easy riding a vehicle as we have seen in many a day." One of his experiences on a country trip in that period catches the imagination: Three miles south of Rochester, it was recounted, the doctor ran on a wolf that was tracking a deer; "the doctor killed the wolf, but got bitten."

Having become interested in Dakota lands, Dr. Nichols in 1879 bought a large farm, sold his Rochester home, and in June, 1880, left with his family for Wahpeton, Dakota, and Breckenridge, Minnesota, east of Wahpeton across the Red River. Early in 1883 he removed from Wahpeton to Minneapolis; there his daughter, aged seven years, died. A few months later Dr. Nichols removed to Belle Plaine, Scott County; on December 31, 1883, when he received his state license, No. 646 (R), he was living in St. Paul. As listed on the roster of the state medical society, in 1887-1891 he was in Merriam Park; 1892-1895, in Wood Lake, Yellow Medicine County; in 1896-1902, in Milaca, Mille Lacs County. For an unverified time he was in Hinckley, Pine County. In 1902 he was on the honor roll of the society, of physicians who for twenty-five years or more had been members of the organization. After 1902 Dr. Nichols' name did not appear on the roster, nor was it included in the first issue of the directory of the American Medical Association, which was compiled in 1905-1906. It is assumed that around 1902 Dr. Nichols removed to California, where his death occurred in September, 1908.

During Dr. Nichols' residence in Rochester there appeared in the city newspapers an occasional mention of a Dr. O. O. Nichols; research has proved that the name was misprinted and that the notes referred to Dr. G. W. Nichols.

(To be continued in the May issue.)

President's Letter

RURAL MEDICAL CARE

DURING the past two years, numerous inquiries have reached the University of Minnesota Medical School, as well as the Minnesota State Medical Association, regarding the number and distribution of doctors in rural districts and the number of students accepted for enrollment in the medical school. Many inquiries have also been directed to legislative groups.

The primary function of the University of Minnesota Medical School, according to Dean H. S. Diehl, is the education and training of physicians to provide the best possible medical care and public health services to the people of Minnesota. Dr. Diehl made this statement in a recent report to the Committee on University Relations of the Minnesota State Medical Association.

Dr. Diehl stated that the number of students accepted for admission to the medical school is determined by the faculty of the school and is based entirely upon their judgment as to the number that can be adequately trained with the facilities, the staff, and the budget available. No medical organization has ever attempted to exert any influence to restrict the number of students, Dr. Diehl pointed out. He also felt that with present facilities of the medical school, the ideal class would be about 100 students. However, he revealed that this number has been increased voluntarily to 125 students, to meet increased demands, entailing expansion of facilities and staff.

More Doctors Graduated

The number of physicians graduated has increased more rapidly than has the population of the state, and, in 1950, in Minnesota there was 20 per cent more doctors per unit of population than there was in 1930. At the present time there is one doctor for every 735 people.

The training of medical students takes much time because the system of lectures and books has been supplemented in great part by clinical bedside training. The University also trains students in the allied medical sciences and, through the University hospital, provides medical care for tens of thousands of patients annually.

Not Inferior Care

Fewer physicians in smaller communities does not mean inferior medical care for those people. Naturally, with modern facilities as advanced as they are today, people can go to a physician's office, clinic or hospital with much greater ease and less time than the old country doctor could go five miles to see a patient. And today's patient also has the advantage of accumulative medical knowledge—the best in the world.

Dr. Diehl explained that the University has voluntarily increased its capacity to enroll medical students and is working now on a plan to accelerate its program further. On a population basis, compared with other states, Minnesota has more than its share of physicians—3,886 is the actual figure, and Minnesota's share of the nation's 178,000 practicing physicians would be only 3,560. Also, of the 6,000 physicians graduated annually, Minnesota's share would be 120—Minnesota with 125 is more than keeping pace with the need, and is constantly striving to improve this excellent record.

STATE MEETING

THE program of the ninety-eighth annual meeting of our State Medical Association to be held in Rochester, April 30, May 1 and 2, appears in this issue. While the program contains no innovations the program represents the evolutionary result of nearly a century of experience in the holding of medical conventions. We are inclined to be complacent when confronted by the scientific exhibits, the colored cinema, the antibiotic and the advances in diagnosis and operative treatment of heart and lung diseases. Imagine the reaction of our predecessors who attended our first meeting ninety-seven years ago were they able to attend this year's meeting.

The Mayo Civic Auditorium is well adapted for the general and sectional meetings and the Mayo Foundation House for the Round Table discussions. Those attending the convention will be the guests of the Olmsted-Houston-Fillmore-Dodge County Medical Society on Monday evening at the Variety night open house. The annual banquet is scheduled to be held at Valencia, a mile north of the city on Highway 52 on Tuesday evening. Dr. John W. Cline of San Francisco, president elect of the A.M.A. and a forceful speaker, will address the banqueters following the address by Dr. J. F. Norman, president of our State Medical Association.

A visit to Rochester should include the Rochester Public Health Center, open each afternoon and the second annual Art Exhibit, sponsored by the Minnesota Physicians Art Association.

The annual meeting of the M.S.M.A. is each year the largest held in the state. The programs are usually well worth while and this year's program is no exception. The meeting affords an unsurpassed opportunity to meet one's professional friends and acquaintances as well as to add to one's scientific knowledge.

LACK OF PHYSICIANS FOR VETERANS HOSPITALS

THE FACT that two new Veterans Hospitals in West Virginia, which cost the taxpayers $12,000,000 and have a capacity of 4,000 beds, have been unoccupied the past year because of a lack of physicians, has had considerable publicity of late in the press. Editorial comment has varied.

One editorial which appeared in a Minnesota paper attributed the lack of physicians to an overall shortage of physicians in the country and blamed this lack on the attitude of the AMA in opposing federal subsidy for the expansion of the medical schools. The statement has been made repeatedly that there is a scarcity of physicians in the country. There has been, for the most part, in recent years little evidence of a shortage of physicians. There are, as a matter of fact, more physicians in relation to the population in the United States than in most, if not all, other countries. In the various states, the number of people for each physician are: California 639; Connecticut 612; Illinois 660; Massachusetts 538; New York 475; Michigan 914; Minnesota 718; North Dakota 1000; Tennessee 1000. This is because the medical schools of the country have been increasing their yearly output of physicians over the past twenty years from 2,680 in 1920 to 5,553 in 1950—more than double, in fact. The accelerated program of the medical schools during the World War II years added an estimated 5,000 or 6,000 additional graduates. Of course, with the resumption of mobilization and war status there is now a scarcity of everything, including medical school graduates. To meet the abnormal need for more doctors, the medical schools are seriously considering the resumption of the accelerated medical school program on a national basis.

It is true that the medical profession is strongly opposed to federal subsidy of. the medical schools. Federal subsidy means federal control and a step towards socialism.

As to the real reason for the lack of medical personnel for the two VA hospitals in West Virginia, General Hawley and Dr. Paul Magnuson and others not associated with the Veterans Administration have stressed the importance of locating VA hospitals near medical centers and centers of population. The building of VA hospitals near medical centers and placing medical care under the supervision of medical schools as was done in Minnesota and taking medical care out of politics have resulted in the provision of first-class care for the veterans. Allowing political pressure to influence the location of VA hospitals and building hospitals in spots isolated from centers of population have proven disastrous. Following World War I a VA orthopedic hospital was built out West distant from civilization and could never be used—reason, lack of professional personnel. The lesson was not learned. Not only were these two hospitals built in West Virginia but another was built in Wisconsin, ignoring the lesson which should have been learned. Trying to make the AMA the scapegoat for this inexcusable waste of the taxpayers' money just will not succeed.

As we have previously pointed out, the present law provides for the care of veterans by the Veterans Administration for disabilities not service-connected, providing beds are available and the veteran states he is unable to provide medical care for himself. As a result, 85 per cent of veterans in the veterans hospitals are being treated for disabilities in no way service-connected. The VA facilities are without doubt more than sufficient for the present care of service-connected disabilities without these unmanned hospitals in West Virginia and Wisconsin. This does not mean that the building of hospitals, which it should be known in advance cannot be staffed, is not reprehensible.

HUMAN BRUCELLOSIS

HUMAN BRUCELLOSIS continues to be a confusing clinical problem. Diagnosis, except in the acute phases of the disease, is often difficult to establish with certainty. Therapy of acute brucellosis with the newer antibiotics without doubt controls the acute signs and symptoms of the disease and markedly reduces the incidence of complications. However, the rather high relapse rate, either clinical, bacteriological, or both, indicates that an effective therapeutic agent, which will eradicate the causitive organism from the body tissues, is not yet available. In this regard it would appear that combined therapy such as aureomycin plus either streptomycin, or dihydrostreptomycin, may be more effective than any one antibiotic alone.

The incidence of human brucellosis is related directly to the incidence of the disease in domestic animals. Since brucellosis, except for laboratory infections, is transmitted from infected animals to man, the human disease is most commonly seen in farmers, veterinarians, packing house workers, and individuals consuming unpasteurized dairy products. Physicians in endemic areas now suspect the disease in those patients with potential exposure to infection who manifest chills, fever, weakness, malaise and generalized aches and pains. In such cases, a diagnosis of brucellosis may not be difficult to establish. The majority of patients with acute infections will have an elevated agglutinin titer above the questionable 1:40 or 1:80 range and many will have positive blood cultures if careful, frequent bacteriological studies are made. It is, however, in the cases of so-called "chronic brucellosis" with prolonged, vague, poorly defined symptoms, little or no fever, and few or no remarkable physical findings that the questions of a correct diagnosis and the best therapy most often arise. It would appear that too often patients are diagnosed as having "chronic brucellosis" on the basis of a positive skin test or a questionably significant agglutinin titer. As a general rule, a diagnosis based on these findings alone without other more definite evidence is, at best, subject to considerable doubt. On the other hand, it must be recognized that a few patients who have had bacteriologically proved brucellosis may continue, after treatment, to manifest the signs and symptoms of "chronic brucellosis" for months or even years without clear-cut laboratory evidence of active disease. In many of these cases, bacteriological studies are repeatedly negative and the agglutinin titer may be low. Are, then, the symptoms in such cases due to brucellosis?—or are they related to other causes such as an incidental or associated neurosis?

At the present time, there is no good objective basis upon which to formulate the correct answer to these important and fundamental questions. The clinician must rely upon his good judgment and a critical evaluation of each case—and accept the fact that his final conclusion may often be wrong.

If this large area of uncertainty prevails in the correct diagnosis of "chronic brucellosis," it is not surprising that so much argument is heard as to the relative merits of the various types of therapy for "chronic brucellosis." Unbiased, scientific evaluation must certainly doubt the efficacy of vaccine therapy. On the other hand, antibiotic therapy in "chronic brucellosis" has too often been of questionable benefit. It seems fair to state that at the present time there is no specific therapy for "chronic brucellosis" which can be depended upon to produce good results.

All of these problems relating to the diagnosis and treatment of human brucellosis clearly demonstrate the need for much more fundamental investigation. The necessity for control of the disease in animals is self-evident. More specific and discriminating diagnostic procedures would be extremely helpful. Much more knowledge pertaining to the fundamental disease process in the human body must be accumulated. Finally, continuing efforts must be made to find a therapy which will get at and eradicate the infection from the body tissues. Only when these things have been accomplished can human brucellosis be considered as one of the conquered infectious diseases.

—J. M. S.

BOVINE BRUCELLOSIS

BOVINE brucellosis control and eradication on an individual herd basis began in Minnesota many years ago. However, in 1934 and 1935, during the drouth period, this program received a marked impetus when the elimination of diseased animals became an important part of the cattle reduction program of that period. Large numbers of herds were tested in this interval with the serum agglutination test for brucellosis and many infected animals sold for slaughter.

In 1939 a state law provided for bovine brucellosis control on a county area basis. For the area control plan to become effective in a county, at least 67 per cent of the cattle owners must sign a petition requesting the area plan of control. If the petition requirements are satisfied, all cattle owners in the county are required to submit their cattle to the serum agglutination test which is conducted at state and Federal expense. All infected herds so disclosed are placed under quarantine and retested at intervals of thirty to sixty days until they pass one negative test. After three successive negative tests such herds are considered as brucellosis free.

The owner of an infected herd may choose one of the three following plans of eliminating the disease: (1) Elimination of the infected animals for slaughter. (2) Isolation or segregation of the infected animals as a separate unit from the negative animals under suitable quarantine and elimination for slaughter of such animals as early as feasible. (3) If the farmstead and pastures are such that suitable quarantine measures such as double fencing of pastures of adjoining farms and fencing animals away from watercourses and drainage ditches will provide necessary protection to neighboring herds, the infected animals may be retained temporarily on the premises and a program of calfhood vaccination with *Br. abortus* strain 19 followed to provide replacements for infected animals as early as possible.

The first plan, elimination by selling for slaughter, is the most feasible plan for a high percentage of infected herds. On the average, approximately 20 per cent of the animals in infected herds are found to be positive to the agglutination test. Approximately 75 to 80 per cent of the infected herds have less than 20 per cent infection, and over 50 per cent have less than 10 per cent infection. Of the infected herds approximately 70 per cent are negative to the first retest if the infected animals disclosed earlier have been removed. Thus, in a high percentage of the infected herds the disease is not extensive nor is the infection spreading rapidly. Therefore elimination of the infected animals is the most economical and practical method of providing satisfactory protection of the negative animals.

The second plan, segregation of infected animals from the remainder of the herd, is feasible on but a small percentage of premises but is employed occasionally where facilities permit and it is desirable to retain valuable lines of breeding.

The third plan, temporary retention of infected animals with calfhood vaccination, is the more practical plan in the more heavily infected herds or where there is good evidence of a rapid spread of the disease. Elimination of the infected animals is not feasible economically in many such herds. Calfhood vaccination with strain 19, a viable vaccine of low virulence, does not induce immunity in the common sense of the term, but does produce a significant increase in the resistance. By raising vaccinated replacements the infected animals may be eliminated usually in a period of three to five years.

At the present time, twenty-three counties largely in the northern and western parts of the state are certified as modified brucellosis free (less than 5 per cent infected herds and less than 1 per cent infected cattle). In addition, ten counties are in the process of certification (one or more county-wide tests completed). The first county-wide agglutination test in the thirty-four counties thus far under the area control plan disclosed 97.8 per cent of the cattle and 89 per cent of the herds to be free of brucellosis. For the remainder of the state it is estimated that approximately 95 per cent of the cattle and 75 per cent of the herds are free of the disease.

The chief value of the area plan of control is that it provides very valuable protection for the negative herds in the county by placing the infected herds under quarantine until the infection can be eradicated. The eradication of the disease from the infected herd is accomplished by the particular plan of procedure best suited to the status of the disease within the herd. As the area control plan is extended to the remainder of the state it is anticipated that bovine brucellosis will be reduced eventually to the very low level now experienced for bovine tuberculosis.

—M.H.R.

ARE ANTICOAGULANTS ALWAYS INDICATED IN ACUTE CORONARY INFARCTION?

CERTAIN published series have shown that the incidence of embolic phenomena, if not mortality, in patients treated with anticoagulants, is definitely lower than in control series in which they are not used. Does this mean, therefore, that the physician is not furnishing the proper and accepted treatment if he omits the use of anticoagulants in these cases?

We venture the opinion that all cardiologists do not treat all patients suffering from acute myocardial infarction with anticoagulants irrespective of the severity of their symptoms. There are several reasons why this medication is at times omitted. The administration of Heparin or Dicumerol is not without some hazard as regards hemorrhage, particularly. The daily puncturing of a vein is more or less disturbing to a more or less ill patient. The cost to the patient is something to take into consideration in many cases.

An analysis of the question of whether to use or not to use anticoagulants recently appeared. In brief, the authors* conclude from an analysis of 424 cases, in which no coagulants were used, that anticoagulants may be dispensed with in good risk patients—that is, in those who (1) have not had a previous infarction; (2) do not have intractable pain; (3) do not have an extreme degree or persistence of shock; (4) do not have significant enlargement of the heart; (5) do not have a gallop rhythm, congestive heart failure, auricular fibrillation or flutter, ventricular tachycardia or intraventricular block; (6) do not have diabetes or other complicating serious disease. The age of the patient does not seem to affect the treatment or prognosis. Of the 204 patients who during the first twenty-four hours of hospitalization lacked any of these indications of being poor risks, only five died, a mortality of 2.45 per cent; and only two of the five could possibly have been saved by anticoagulant therapy. The incidence of thromboembolism in this group of 204 patients was only 0.98 per cent. In contrast were the remaining 220 of the group classed as poor risks, in which the mortality was 44.5 per cent and the incidence of thromboembolic complications was 7.7 per cent.

Statistically, then, the hazard incurred in not using an anticoagulant in the good risk patients is probably no greater than the risk incurred by using the anticoagulant. One's decision to dispense with anticoagulants in "good risk" patients, therefore, receives the approval of these authors.

*Russek, Henry T.; Zohman, Burton L.; White, La Vere G. and Doerner, Alexander A.: Indications for Bishydroxycoumarin (dicumerol) in acute myocardial infarction. J.A.M.A., 145:390, (Feb. 10) 1951.

IMPRESSIONS FROM EUROPEAN NEUROSURGICAL CLINICS

(Continued from Page 338)

ly and accurately any inclination to a state of shock as might occur with blood loss and surgical trauma.

This entire survey which occupied two months was quite revealing as to the amazing uniform progress displayed in the European Neurosurgical Clinics. Each hospital was a busy and serious place. It was most gratifying to learn how closely related these centers are particularly in the friendly relationship of the medical staffs. The impression gained during this tour was that the personnel of the European teaching hospitals reflected in their work a firm hope for a secure future.

MEDICAL ECONOMICS

Edited by the Committee on Medical Economics
of the
Minnesota State Medical Association
George Earl, M.D., Chairman

CONFERENCE DISCUSSES RURAL HEALTH NEEDS

Latest needs and accomplishments in the broad field of rural health were discussed and evaluated at the recent Sixth National Conference on Rural Health, held in Memphis, Tennessee, with leaders in the field presenting their views of the problem.

Discussing the National Rural Health Program, Dr. F. S. Crockett, Chairman of the Committee on Rural Health of the American Medical Association, declared that the program has not developed solely as a doctor's plan, stating that "none has claimed a preferred or dominant position in this." Stressing the need for active cooperation among all groups interested in and affected by rural health considerations, Dr. Crockett felt that "you cannot decide a truth on a 60 to 40 per cent basis."

Dr. Crockett reported to the large attending audience that at the present time there are 1,190 health councils throughout the country. This averages about one in every three counties of the nation.

He felt, however, that such a report was not entirely accurate or complete because no one can agree on just what a health council is or what its duties and responsibilities should be. Its function, Dr. Crockett said, "should be largely advisory in nature." It should have medical advisers and should concern itself with *all* the problems of the public's health.

No Remote Control

Health, on both an individual and a community-wide level, is like salvation, it comes from within," according to Dr. Crockett, who stated that the individual community needs cannot be determined by remote control.

Program's Meaning Explained

Aubrey D. Gates, Field Director for the Committee on Rural Health of the American Medical Association, explained the meaning of the national rural health program in terms of the vast difference between medical care and health. Definitions of these often-confused terms, said Gates, will clear up many facets of health problems throughout the nation. He defined medical care as a purchasable service, while health is a personal responsibility and, in itself, is not really purchasable.

Changes in medical techniques have brought about many different problems in rural health. In some cases, medical science, through its rapid advance in ridding the world of some maladies, has actually handicapped itself by ridding itself of cases by which to teach newcomers! For instance, now it is almost impossible to find a pellegra patient with which to teach medical students about the disease. It has been several years since doctors in the South have found a case of real malaria. However, the flexibility and adaptability of modern medical science has progressed to such an advanced stage that it can effectively cope with new and different problems in rural health, as well as other related fields, as they appear.

County Council Discussed

Dr. E. K. Yantes of Wilmington, Ohio, told the conference of the problems faced and the progress made by his county health council. He said that the council was composed of 41 different organizations and community groups which were active, but separately so, in the county.

The achievements of this group were listed by Dr. Yantes, who felt that those achievements were only possible through a co-ordinated effort on the part of the entire county. By looking into the county's own health situation and appraising the needs, it was able to go ahead with a reorganization of the health department. The Council also made a health survey of the community. Each worker had 10 families to visit. The health program was publicized by means of banners across main streets, posters, newspapers and other publicity.

The results were tabulated in map and chart form, and made available for further study and improvement of conditions. An immunization program was carried out in which one-third of the community was immunized and 7 per cent vaccinated, with 42 per cent of the pre-school children protected against diphtheria. In the adult population, only the ex-servicemen were protected against tetanus. The survey showed that 75 per cent of the pregnancies were carried to full-term, and 60 per cent of the mothers had prenatal care. The report revealed that undulant fever was the biggest problem.

Among other achievements of the Council, Dr. Yantes stated that a county-wide milk ordinance was passed, education and progress on swine brucellosis was done, immunization and vaccination was made compulsory in the schools, and the first well-baby clinics and prenatal schools in the area were established.

Health Everybody's Job

H. E. Slusher, Chairman of the Health Committee of the American Farm Bureau Federation, outlined the broad view of the rural health situation. He declared that the realization has come that people must be reached where they live, that health is no longer completely the doctor's job, but should be the personal responsibility of every person who is part of any town or community in the country. Slusher said that "before the turn of the century, health was a doctor's job. Doctors are doing a wonderful job of patching us up and keeping us going," but now it is a broader field of community, county, state and national responsibility.

MINNESOTA HOLDS RURAL HEALTH DINNER

In conjunction with the annual County Officers Meeting, held in Saint Paul on March 3, the Minnesota State Medical Association inaugurated its first rural health dinner, to bring together farm and medical leaders to talk over the remaining problems in Minnesota rural health. The stated purpose of this gathering:

> ". . . will be the forerunner of annual statewide rural health conferences, where farm and medical leaders may work together to solve the remaining problems of rural health, as they have worked together in the past to lay a sound framework for rural medical facilities and health education.
>
> "Through a continuation of the co-ordinated efforts of farmers and doctors, Minnesota will retain and strengthen its record for longer, healthier living."

Distribution Discussed

Speakers at the dinner included Dr. Paul C. Leck, Austin, who reviewed Minnesota's progress and future needs in rural health. Dr. Leck discussed the problem of doctor distribution, stating that "improved roads bring the doctor minutes and sometimes hours closer to his rural patients in the practice of mid-twentieth century medicine."

Dr. Leck stressed the importance of discarding outmoded ideas about doctor distribution before more progress can be made in rural health. He said:

> "Economists have come to think in terms of market areas rather than county boundary lines in their studies of the American public—both rural and urban—and it is a concept that we have come to adopt, too. Farm people will follow, for the most part, the economic paths that they have set for themselves. If, within their *trade* area they have doctors and hospitals which offer good medical care, then they are apt to accept this situation as satisfactory, without stopping to think of how these facilities are divided among the counties within the specific trade area. Some of the government planners, of course, are still laying out master plans for health care that call for so many hospitals and doctors per county, but the fallacy of this thinking is clearly evident as we recognize the economic, geographic and population differences of counties even within close range of each other."

Praising rural communities for their work in the rural health field, Dr. Leck lauded them for accepting their share of the responsibility involved.

> "For example," he stated, "several small towns have initiated the building of small hospitals, clinics and office buildings which are made available to the physician. This negates one drawback to rural medical practice—the problem of the young doctor who has not the financial capital to provide himself with the equipment and facilities he needs to practice the top grade medical techniques he has learned."

The main speaker of the evening was Franklin D. Murphy, M.D., Dean, University of Kansas School of Medicine, who averred that the rural

GUEST SPEAKERS

The State Medical Association is indebted to the following societies and organizations for guest speakers at this meeting:

The Minnesota Department of Health—Obstetric Manikin Demonstrators: Thomas K. Brown, Professor of Clinical Obstetrics and Gynecology, Washington University School of Medicine, St. Louis, Missouri; Gerald W. Gustafson, Professor of Obstetrics and Gynecology, Indiana University School of Medicine, Indianapolis, Indiana; Edward A. Banner, Consultant, Obstetrics and Gynecology, Mayo Clinic, Rochester.

The Minnesota Heart Association—Speaker, H. B. Sprague, President, American Heart Association, Brookline, Massachusetts.

The Minnesota Radiological Society—Speaker, Wendell G. Scott, Associate Professor of Clinical Radiology, Washington University School of Medicine, St. Louis, Missouri, who will deliver the annual Russell D. Carman Memorial Lecture in Radiology.

The Minnesota Society of Clinical Pathologists—Speaker, Paul W. Schafer, Professor of Surgery and Chairman of the Department of Surgery, University of Kansas School of Medicine, Kansas City, Kansas, who will deliver the annual Arthur H. Sanford Lectureship in Pathology.

Northwestern Pediatric Society—Speaker, John A. Anderson, Professor and Head, Department of Pediatrics, Stanford University School of Medicine, San Francisco, California.

Northern Minnesota Medical Association—Speaker, Bram Rose, Associate Professor of Medicine, McGill University Faculty of Medicine, Montreal, Quebec, Canada.

SOCIAL EVENTS

MONDAY, APRIL 30

Luncheons

American Medical Women's Association, Inc., Minnesota Chapter
12:15 p.m., Continental Room Lounge, Hotel Carlton
Make reservations with Dr. Elizabeth Troxil, Veterans Hospital, 54th St. and 48th Avenue So., Minneapolis.
Open to all visiting women physicians.

Minnesota Chapter, American College of Chest Physicians
12:15 p.m., Pine Room, Hotel Carlton

Dinners

Minnesota Chapter, American Academy of General Practice
6:00 p.m., Rochester Golf and Country Club

Minnesota Medical Foundation, Minnesota Medical Alumni
6:00 p.m., University Club Cafe, Hotel Kahler
Presiding: J. F. Norman, President, Minnesota State Medical Association
Greetings: Dean H. S. Diehl; Edwin J. Simons, member, Board of Trustees, Minnesota Medical Foundation; Herman Drill, President, Minnesota Medical Alumni Association; Owen H. Wangensteen, President, Minnesota Medical Foundation
Address: "University Research Tradition: A Centennial Perspective"—Dean Theodore C. Blegen, Graduate School, University of Minnesota

All Minnesota physicians and their wives are cordially invited. Make reservations with Dr. George N. Aagaard, Department of Continuation Medical Education, University of Minnesota Hospitals, Minneapolis

Nu Sigma Nu
6:00 p.m., Pine Room, Hotel Carlton

Special Meeting

Medical Veterans Society of Minnesota
5:00 p.m., University Club, Mezzanine Floor, Hotel Kahler

TUESDAY, MAY 1

Dinners

Minnesota Radiological Society
6:00 p.m., Rochester Golf and Country Club
Minnesota Society of Clinical Pathologists
6:30 p.m., Markay Dining Room
Annual Banquet of Minnesota State Medical Association
7:00 p.m., Valencia

GENERAL SESSION

MONDAY, APRIL 30

Scientific Committee: H. B. Sweetser, W. E. Herrell, C. B. Nessa, C. L. Oppegaard, M. G. Gillespie, W. P. Ritchie

A.M.
8:30 Visit Scientific and Technical Exhibits ....Auditorium

FRACTURES

9:00 Clinics by Members of the Mayo Clinic Staff ....Auditorium Theater
Symposium on Fractures with Presentation of Cases
Moderator: P. R. Lipscomb
"General Principles of Fracture Management"—P. R. Lipscomb
"Inter-trochanteric Fractures of the Femur"— W. H. Bickel
"Fractures of the Elbow Joint"—M. B. Coventry
"Fractures about the Ankle Joint"—J. C. Ivins

Intermission

10:15 Visit Scientific and Technical Exhibits ....Auditorium
11:00 "Rehabilitation in Fracture Patients" Auditorium Theater
Wallace Cole, St. Paul
Harry B. Hall, Minneapolis

Afternoon

P.M.
12:15 Obstetric Manikin Demonstration
Chamber of Commerce Dining Room
Thomas K. Brown, Professor of Clinical Obstetrics and Gynecology, Washington University School of Medicine, St. Louis, Missouri
12:15 Miscellaneous Luncheons
1:30 Visit Scientific and Technical Exhibits
Auditorium

NEW DRUGS

2:00 Cortisone and ACTH Symposium............. Auditorium Theater
Moderator: H. F. Polley, Rochester
"Physiological and Metabolic Aspects of Cortisone and ACTH"—E. B. Flink, Minneapolis
"The Effects of Cortisone in Glomerulonephritis and the Nephropathy of Disseminated Lupus Erythematosus"—Wyman E. Jacobson, Minneapolis
"Cortisone and ACTH in Hay Fever and Asthma" G. A. Koelsche, Rochester
"Cortisone in Periarteritis Nodosa"—R. M. Shick, Rochester
"Cortisone in the Treatment of Skin Conditions" —L. A. Brunsting, Rochester.
"Cortisone in the Treatment of Rheumatic Fever" —H. L. Smith, Rochester
Summary—H. F. Polley, Rochester

3:15 **Intermission**

Visit Scientific and Technical Exhibits........ Auditorium
4:00 New Drugs (continued).....Auditorium Theater
"Banthine and Other Drugs in the Treatment Gastrointestinal Disease"—R. N. Bieter, Minneapolis
"Combinations of Antibiotics in Treatment of Infectious Diseases"—W. E. Wellman, Rochester
"Radioactive Iodine in Thyroid Disease"—William M. McConahey, Rochester
"Current Chemotherapy of the Leukemias"—Talbert Cooper, Rochester
5:00 Visit Scientific and Technical Exhibits........ Auditorium
5:15 Obstetric Manikin Demonstration.............. South Hall, Auditorium
Thomas K. Brown, Professor of Clinical Obstetrics and Gynecology, Washington University School of Medicine, St. Louis, Missouri
6:00 Special Dinners
8:30 Variety Night...............Auditorium Theater

SPECIAL SESSION

MONDAY, APRIL 30, 1951

South Hall, Auditorium

P.M.
2:00 Minnesota Chapter of the American College of Chest Physicians
"Coin Lesions of the Lung"—Daniel L. Fink, St. Paul
"Crushing Injuries of the Chest"—Nathan K. Jensen, Minneapolis
"Bronchial Asthma"—Royal V. Sherman, Red Wing
"Association of Pulmonary Tuberculosis and Carcinoma"—G. A. Hedberg, Nopeming
W. H. Wierman, Rochester
G. G. Graham, Rochester
"Surgery for Diseases of the Heart and Great Vessels"—John W. Kirklin, Rochester

8:30 Visit Scientific and Technical Exhibits........ Auditorium

PULMONARY DISEASES

9:00 Clinic by Members of the Mayo Clinic Staff.. Auditorium Theater
Four Case Presentations Illustrating Newer Concepts of Diagnosis and Treatment of Pulmonary Diseases
Moderator: H. J. Moersch
Participants: S. W. Harrington, J. R. McDonald, L. A. Weed, H. W. Schmidt

10:15 **Intermission**

Visit Scientific and Technical Exhibits........ Auditorium

11:00 "The Present Status of BCG Vaccine"—E. P. K. Fenger, Oak Terrace

"Bronchoscopy and Common Chest Diseases"—Paul G. Boman, Duluth

"Surgical Treatment of Common Pulmonary Conditions"—Lyle A. Tongen, St. Paul

"Rheumatic Fever—Determination of Activity"—John A. Anderson, Professor and Head, Department of Pediatrics, Stanford University School of Medicine, San Francisco, California

Afternoon

P.M.

12:15 Obstetric Manikin Demonstration.............. Mayo Foundation House

Gerald W. Gustafson, Professor of Obstetrics and Gynecology, Indiana University School of Medicine, Indianapolis, Indiana

12:15 Round-Table Luncheons

1:30 Visit Scientific and Technical Exhibits........ Auditorium

2:00 Russell D. Carman Memorial Lecture........ Auditorium Theater

Presentation of Speaker—Oscar Lipschultz, Minneapolis, President, Minnesota Radiological Society

"Advances in the Radiological Diagnosis of Heart Disease"—Wendell G. Scott, Associate Professor of Clinical Radiology, Washington University School of Medicine, St. Louis, Missouri

ACUTE ABDOMINAL CONDITIONS

2:40 Arthur H. Sanford Lectureship in Pathology.. Auditorium Theater

Presentation of Speaker—John F. Noble, St. Paul, President, Minnesota Society of Clinical Pathologists

"Pathology of the Acute Abdomen"—Paul W. Schafer, Professor of Surgery and Chairman of the Department of Surgery, University of Kansas School of Medicine, Kansas City, Kansas

3:15 **Intermission**

Visit Scientific and Technical Exhibits........ Auditorium

4:00 Acute Abdominal Conditions (continued)...... Auditorium Theater

"Radiologic Aspects"—Leo G. Rigler, Minneapolis

"Surgical Aspects"—Owen G. McDonald, Duluth

"Urologic Aspects—Theodore H. Sweetser, Minneapolis

"Gynecologic Aspects"—James J. Swendson, St. Paul

"Summary"—N. Logan Leven, St. Paul

5:00 Visit Scientific and Technical Exhibits....... Auditorium

5:15 Obstetric Manikin Demonstration.....South Hall, Auditorium

Gerald W. Gustafson, Professor of Obstetrics and Gynecology, Indiana University School of Medicine, Indianapolis, Indiana

6:00 Special Dinners

7:00 Annual Banquet........................Valencia

Presiding: P. A. O'Leary, President, Olmsted-Houston-Fillmore-Dodge County Medical Society

Introduction of Mrs. F. P. Moersch, Rochester, President, Woman's Auxiliary

Presentation of Fifty-Club Certificates

Presentation of Southern Minnesota Medical Association Medal

Presentation of Distinguished Service Medal

Presidential Address—J. F. Norman, Crookston, President, Minnesota State Medical Association

"The Problems Confronting Medicine in the Immediate Future—John W. Cline, President-Elect, American Medical Association, San Francisco, California

SPECIAL SESSION

TUESDAY, MAY 1

3:15 EMBRYOLOGY OF THE EYE

Minnesota Academy of Medicine

Meeting of October 11, 1950

The regular monthly meeting of the Minnesota Academy of Medicine was held on Wednesday evening, October 11, 1950, at the Town & Country Club. Dinner was served at 7 o'clock and the meeting was called to order at 8:15 p.m. by the President, Dr. William A. Hanson.

There were thirty-seven members and one guest present.

Minutes of the May meeting were read and approved.

Dr. F. F. Callahan read the following Memorial to Dr. Everett K. Geer. A motion was carried that this be placed in the records of the Academy and a copy sent to the family.

EVERETT KINNE GEER
1893-1950

Dr. Everett Kinne Geer died in his home in Saint Paul on May 3, 1950, following a protracted illness.

Dr. Geer was born in Saint Paul on January 14, 1893, the son of Dr. Ethelbert F. Geer and Helen Hazen Geer. After graduating from Central High School, he attended the University of Minnesota, where he obtained a B.S. degree in 1915 and M.D. degree in 1917. He served his internship in the Minneapolis General Hospital in 1916-1917 and did postgraduate work in the Trudeau School for Tuberculosis at Saranac Lake, New York.

In the first World War, he did his tour of duty as a Lieutenant in the Medical Corps of the U. S. Navy.

In 1918, Dr. Geer married Olive Barnett Lewis, who survives him, as well as a daughter, Mrs. John Donohower, and a son, Thomas. His eldest son, Everett K. Geer, Jr., was killed in action in World War II.

Dr. Geer held many important positions in his special field of training. He was Chief Physician of the Tuberculosis Division at Ancker Hospital in St. Paul from 1922 until his resignation terminated the appointment in 1949. In 1932, he was made Medical Director of the Children's Preventorium, Ramsey County, and took an active role in the management of this institution. He was consultant for Pokegama Sanatorium, Pokegama, Pine County, Minnesota, from 1920 to 1943 when the institution closed. The University of Minnesota Medical School recognized his ability by making him instructor of Medicine in 1921 and Assistant Professor in 1934. He was a diplomate of the American Board of Internal Medicine and a fellow of the American College of Physicians.

Dr. Geer was a member of the following societies: American Heart Association, American Sanatorium Association, American Trudeau Society, Central Society for Clinical Research, International Union against Tuberculosis, Minnesota Academy of Medicine, Minnesota Society of Internal Medicine, Minnesota Pathological Society, Minnesota State Medical Association, Minnesota Trudeau Society, National Tuberculosis Association, Ramsey County Medical Society, Minnesota Public Health Association and the Ramsey County Public Health Association.

A number of these societies added to Dr. Geer's responsibilities by giving him official position. He was a council member of the American Trudeau Society from 1941 to 1943. In addition he served as President of the Minnesota Trudeau Society in 1934-35 and of the Ramsey County Public Health Association in 1944.

When the Veterans Administration was reorganized under General Omar Bradley, Dr. Geer was appointed Veterans Branch Section Chief in Tuberculosis for the states of Minnesota, North and South Dakota, Iowa, and Nebraska. The Veterans Program was altered later and Area Consultants in Tuberculosis were appointed for various groups of states. Dr. Geer was the Area Consultant in Tuberculosis for the above five states plus Wisconsin, Michigan, Illinois, Wyoming, and Montana.

The *Index Medicus* lists 14 papers by Dr. Geer on problems of chest disease. In 1932, he read a paper entitled "Primary Tuberculosis Among Nurses" before the National Tuberculosis Association. This was followed by 4 papers on the same theme and introduced his work in the prevention of tuberculosis infection in nurses employed in institutions for the care of tuberculosis patients. This contribution was outstanding and his technique has been adopted in many sanatoria here and abroad. Dr. Geer's influence outside the United States is illustrated by a paper in Spanish on prevention of tuberculosis infection which appeared in El dia Medico (Buenos Aires). He will long be remembered by those who pay attention to the prevention of tuberculosis.

Dr. H. M. N. Wynne read the following memorial to Dr. J. K. Anderson who died on March 27, 1950. A motion was carried that this be placed on the records of the Academy and a copy sent to the family.

JAMES KERR ANDERSON
1891-1950

Dr. James Kerr Anderson was born in East Liverpool, Ohio, on July 11, 1891. He was graduated in 1913 with the degree of A.B. from Washington and Jefferson College, located in Washington, Pennsylvania. He entered the Medical School of the Johns Hopkins University the same year and received his M.D. degree in 1917. His internship was served in the Minneapolis General Hospital from June to December, 1917, when he was called for active duty in the U.S. Army Medical Corps as 1st Lieutenant in December, 1917. He served in the army until August, 1920. He started the practice of medicine in Minneapolis but was taken ill and spent the following three years in Glen Lake Sanatorium. In 1924 he became Superintendent of the Deerwood Sanatorium at Deer River, Minnesota, and the following year he was Superintendent of Sunnycrest Sanatorium at Crookston, Minnesota, where he worked until 1929, when he entered the practice of proctology in association with Dr. W. A. Fansler. Dr. Anderson was a clinical associate professor of surgery at the University of Minnesota and an active member of the staffs of Abbott, Northwestern, St. Mary's and Minneapolis General Hospitals. He was a member and past president of the Hennepin County Medical Society, and a member of the Minnesota State Medical Association, the Minneapolis Academy of Medicine, the Minnesota Academy of Medicine, and a Fellow of the American Medical Association, the American College of Surgeons and the American Proctological Society, and a Diplomate of the American Board of Surgery in Proctology. Phi Beta Pi was one of his active interests and he was a past National President of this medical fraternity. Dr. Anderson was co-author with Dr. H. O. McPheeters of the book "Injection Treatment of Varicose Veins and Hemorrhoids" as well as a number of articles on proctological subjects.

In 1917, he was married to Clara Hazel Abele. Their daughter, Gretchen (Mrs. Robert Osgood) and Mrs. Anderson, as well as his mother, survive him.

James Kerr Anderson died March 27, 1950. Services were held in the Chapel of Westminster Church, Minneapolis, and burial was in Zanesville, Ohio.

Dr. Anderson was loved by his professional friends as well as by his patients and his friendship and interest in older people was remarkable. His nonprofessional visits cheered many an ill friend. In spite of his several illnesses and painful afflictions, Dr. Anderson remained to his death a hardworking, kindly and cheerful man.

The Secretary read the names of candidates to be voted on at the November meeting to fill twelve vacancies in the Minnapolis list, this list having been increased from thirty-five to forty-five. There are no vacancies at the present time in the Saint Paul list.

There was some discussion of the revisions in the Constitution or Articles of Incorporation, and it was finally moved, seconded and carried that these articles under consideration be referred back to the Executive Committee for further study and rewording, to be voted on at a later meeting.

A motion was made and seconded that we limit the next election to five of those names present in the list and hold the others over until later meetings. This motion was not carried, however.

The scientific program followed.

Dr. Gordon Kamman, Saint Paul, read a paper on "Traumatic Neurosis, Compensation Neurosis, Attitudinal Pathosis."

There was no discussion of this paper.

Dr. Lyle H. Hay, of the U. S. Veterans Hospital, by invitation, read a paper on "Gastric Polyps." X-ray lantern slides were shown.

GASTRIC POLYPS

A Clinical Study

LYLE H. HAY, M.D.
Minneapolis, Minnesota

The rise in age of the general population due to improved public health practices, advances in therapy of bacterial infection and the decreased mortality in surgical treatment has made malignancy an increasingly important problem. Pending solution of the total problem of cancer, the early diagnosis and treatment of malignancy offer the only real promise for reducing mortality.

This study was made on ninety-seven patients with gastric polyps. The purpose of the study was first to determine what the characteristics of polyps were, i.e., what symptoms they provoked, what the laboratory findings were, what the x-ray picture showed, and what the gastroscopist saw. Second, to determine what natural evolution of pathology followed the identification of gastric polyps. Third, to determine whether all polyps were of the same significance or whether we could judge some to be relatively innocuous and others to offer a more serious prognosis. Fourth, to find a satisfactory screening test for patients which would permit us to employ roentgen study of the stomach and gastroscopy in an attempt to identify polyps. In order to make this a picture of the characteristics of a single clinical entity every effort was made to include only gastric adenomas which we define as a benign epithelial tumor originating from the tubules or glands of the gastric mucosa.

Cases diagnosed clinically were included only after having been visualized on at least two occasions roentgenologically, gastroscopically or by each method on one occasion.

The benign adenomas were selected from benign tumors encountered in the surgical pathology laboratory. No epithelial benign tumors were excluded.

Benign Gastric Polyps

Symptomatology.—In order to eliminate symptoms due to carcinoma, the symptomatology was determined from the sixty-nine cases having only benign polyps or adenomas.

1. Epigastric distress was the most common symptom and was noted in twenty-four of the sixty-nine cases. This was characterized by gaseousness and epigastric fullness usually most marked after eating. In nine of the twenty-four cases the epigastric distress had been present from one to twenty years.
2. Nausea and vomiting were experienced by only four patients, all of whom had epigastric distress and all of whom obtained relief from vomiting.
3. Appreciable weight loss was noted in only seven patients. In two of these patients prolapsing polyps apparently interfering with gastric emptying were present.
4. Pernicious anemia was present in ten patients having benign gastric polyps and iron deficiency anemias in two additional cases. In addition, three cases of pernicious anemia occurred in the group of twenty-eight cases having adenomas associated with carcinoma of the stomach.

Numerous observers have noted the frequency with which benign adenomas and/or carcinoma of the stomach are associated with pernicious anemia.

5. Only three patients had a history of gastrointestinal bleeding. None of these could be classed as showing severe hemorrhage.
6. Twenty-four patients diagnosed as having benign polyps had no symptoms referable to the gastrointestinal tract.

Since nine of the ten patients with pernicious anemia had no symptoms other than those of anemia to implicate the gastrointestinal tract we find thirty-three of sixty-nine (47.7 per cent) of patients complained of no symptoms ascribable to gastric polyps per se.

Laboratory Tests.—*Stool examinations* resulted in positive guaiac tests in twelve of the forty-four patients examined.

Gastric analysis indicated achlorhydria to histamine in sixty-three of sixty-nine patients. In most cases several examinations were made.

Hypochlorhydria was noted in three patients and only three of the sixty-nine patients examined showed more than 25 degrees of free acid.

Carcinoma Associated with Benign Adenomas

Symptomatology.—The symptoms in the twenty-eight cases having benign adenomas associated with carcinoma of the stomach were more severe. Twenty-one cases showed epigastric distress, six nausea and vomiting, sixteen significant weight loss, five hypochromic anemia and three bleeding. Only one of the twenty-eight showed no symptoms referable to the upper gastrointestinal tract.

Laboratory Tests.—Stool examinations were positive in 66 per cent of the eighteen cases examined. Gastric analysis indicated achlorhydria to histamine stimulation in twenty-two of the twenty-three cases.

Roentgen Examinations.—Twenty cases diagnosed as having gastric carcinoma where the associated gastric polyps were not detected or ignored were excluded.

In seventy-seven patients examined for detection of polyps and differential diagnosis from cancer, a diagnosis of benign polypi was made in fifty-four instances. In three of these patients, malignancy was subsequently shown. A diagnosis of questionable malignancy was made in sixteen instances and operation advised. Six of these were subsequently proven malignant and ten benign.

In seven cases, polypi were missed by the roentgenologist.

Gastroscopy.—Gastric polyps were visualized in sixty-one of the sixty-six patients examined. A diagnosis of benign lesion was made in fifty-one cases and malignancy was subsequently shown present in three.

Ten cases were diagnosed as possibly malignant. Four of these were malignant and six benign.

By the combined efforts of the roentgenologist and gastroscopist only two of seventy-seven patients handled had surgery delayed in the presence of malignancy and this for nine and nineteen months.

Etiology.—The only significant finding relating to etiology was the frequent finding of an atrophic gastric mucosa with the polyps. Thus, in fifteen cases the occurrence of achlorhydria in the histamine provoked secretion, and/or gastric atrophy by gastroscopy antedated the detection of the gastric polyps from three to thirteen years.

Achlorhydria was present in 92.5 per cent and hypochlorhydria in 4.5 per cent, indicating a functional mucosal change in 97 per cent of cases.

Forty-four of forty-six patients whose mucosa was examined microscopically had a moderate to severe atrophy present.

Ten of the sixty-nine patients having benign polyps had pernicious anemia, a disease by definition requiring mucosal atrophy.

X-Ray Characteristics.—

1. Filling defect which is usually central, round or oval, sharply outlined and smooth in contour.
2. Peristalsis passes through the gastric walls in the region of the defect.
3. Gastric walls are flexible in the region of the tumor.
4. Defect is freely movable.
5. Pedicle can be demonstrated.
6. Defect may appear in duodenal bulb if the tumor prolapses through the pylorus.
7. The lumen of the stomach is not decreased in size.
8. With polyposis, the barium shadow of the stomach may show many small defects.

Characteristics of Gastric Polyps

Size.—Various characteristics of the polyps were studied for significant data. The size of the polyp was the most important factor determined. It is noted that of fifty-four polyps one centimeter or less in diameter only one was malignant. In twenty-nine polyps from one to two centimeters in diameter none were malignant. In thirteen cases over two centimeters in diameter seven were malignant.

Location.—The location of the polypi in the stomach is noted. The only significant figure is the one indicating that when a carcinoma is present it is more likely to be accompanied by benign polyps in the body.

Microscopic Character of Adenomas.—Examination of the adenomas under the microscope revealed data that, if substantiated, may be of assistance when satisfactory biopsies can be taken at gastroscopy.

Some of the adenomas showed epithelium having large cylindrical cells with dark-staining cytoplasm with no evidence of mucus formation. The nuclei were large, hyperchromatic and centrally located. This has been termed "irritative hyperplasia" or "indifferent epithelium" by others. In any case, we note that of the twenty-three adenomas associated with carcinoma thirteen showed the change and ten did not; while of the twenty-five cases not associated with malignancy, five showed the change and twenty did not.

Treatment

Surgical—

1. All polypi 2 cm. in diameter or larger.
2. All polypi causing symptoms, i.e., bleeding, obstruction, etc.
3. Polypi showing an increase in size.
4. Polypi whose roentgenological or gastroscopic appearance suggest malignancy.

The surgical treatment recommended is usually subtotal (75 per cent) gastric resection. Since total gastrectomy has a higher morbidity and mortality and gastric polyps and carcinoma occur with somewhat less frequency in this area; this procedure is recommended only when polypi are demonstrated in the cardia.

Observation.—Patients having polypi not qualifying for surgical therapy or having definite contraindications to gastric resection are recalled for a re-examination by the roentgenologist and gastroscopist at intervals of three or four months.

Prognosis.—In thirty-four patients followed from one to nine years for a total of 125 years, two patients developed carcinoma.

Conclusions

1. One-half of the patients having gastric polypi have no symptomatology indicating gastrointestinal disease.

2. Since gastric analysis shows achlorhydria or a marked hypochlorhydria in 97 per cent of cases this is an adequate screening test for selection of patients for roentgenologic and gastroscopic examination for detection of these precancerous lesions.

3. Roentgenological and gastroscopic examinations each permit the diagnosis of gastric polypi in 90 per cent of cases.

4. Pernicious anemia patients have gastric polypi much more frequently than other patients.

5. The chances of malignancy being present in lesions less than 2 centimeters in diameter are small, whereas in lesions over 2 centimeters they are about 1 in 2.

6. Chronic atrophic gastritis is present in nearly all cases developing adenomas.

7. The probability of a carcinoma developing in a patient diagnosed benign adenoma and observed for three and a half years would seem to be about one in thirteen.

Discussion

Dr. A. E. Regnier, Minneapolis: What percentage did you find of carcinoma involving polyps and what percentage grew separately?

Dr. Hay: Almost all were large enough so that it was impossible to tell whether they involved polyps.

Dr. Regnier: The polyp was an incidental finding in those twenty cases?

Dr. Hay: One patient had carcinoma in one part of the stomach, and the polyp was in another part. I believe there is as much evidence that a stomach with a severe atrophic gastritis, as in pernicious anemia, will develop malignancy as much as one with polyp.

Dr. Regnier: Do you have any figures on the number of malignancies where the carcinoma originated in polyps?

Dr. Hay: About twenty were operated on. Whether it was a malignant polyp or whether it was benign and became malignant, we can't tell.

Dr. George Fahr, Minneapolis: Am I to understand that you are suggesting we should operate on all cases of atrophic gastritis?

Dr. Hay: I feel here we have a little different situation. I think it is likely that patients with atrophic gastritis associated with polypi develop carcinoma no more often than patients with pernicious anemia. I would not suggest that every patient with pernicious anemia be operated upon but if he has a polyp which indicates any evidence of malignancy, then he should be operated. Most of them have the smaller polyp. If the original examiner—gastroscopist or roentgenologist—feels it is a possible malignancy, then operate. But if only one says it is malignant, then the patient is watched.

Dr. Fahr: How often do they return at 6-month intervals?

Dr. Hay: You have to talk it over with the patient and if they are not willing to come back you should proceed with operation. I recall one man who has had 7 or 8 gastroscopies; he would prefer to have them rather than operation.

Dr. Hanson: What years did you take these on?

Dr. Hay: From 1937 to 1947. A lot of patients were not included in the group. They ordinarily would have to be diagnosed twice to have been included. There were about 50 patients not included. This isn't the entire group.

Dr. J. B. Carey, Minneapolis: In answer to Dr. Fahr's question, our patients usually return three or four or six times and then are likely to become indifferent and do not come back.

I wish to commend the Academy for having heard the report of the largest number of gastric polyp cases that have been examined by any one group. No larger group is reported in the literature. As Dr. Hay suggested, our interest arose from the desire for detection of early manifestations of malignant disease. The gastric polyp, of course, was one point of attack. Beginning in 1936, I had seen more than one-hundred polyps by gastroscopic examinations. Some of these were eliminated; for instance, the flat and half-pea adenomas in the antrum region of the stomach with normal gastric mucosa. We had no reason to suspect these were malignant or probably ever would be.

Answering Dr. Regnier's question about the incidence of polyps is difficult because our material is heavily weighted by inclusion of many more patients with atrophic gastritis and achlorhydria than one would come upon ordinarily.

The interesting phase of the situation to me has been the polyps we decide are benign, accepting the responsibility of delaying or deferring operation, and choosing rather to observe them. I have a group of better than thirty that I have seen a number of times; in none of them has there been a suggestion of change in the direction of malignancy. Significant is the change in size and appearance of a polyp between one examination and another. The benign polyp does not change from time to time. If a polyp increases in size or spreads out into the mucosa, that polyp is likely to be malignant. Whether that was a benign adenoma and became malignant, we don't know. In a few cases, the pathologist has described metaplasia or other indifferent cell alterations. A polyp which once was declared to be benign and subsequently shows a change in size, color, or appears to be malignant, may have been an adenocarcinoma, but not recognized as such.

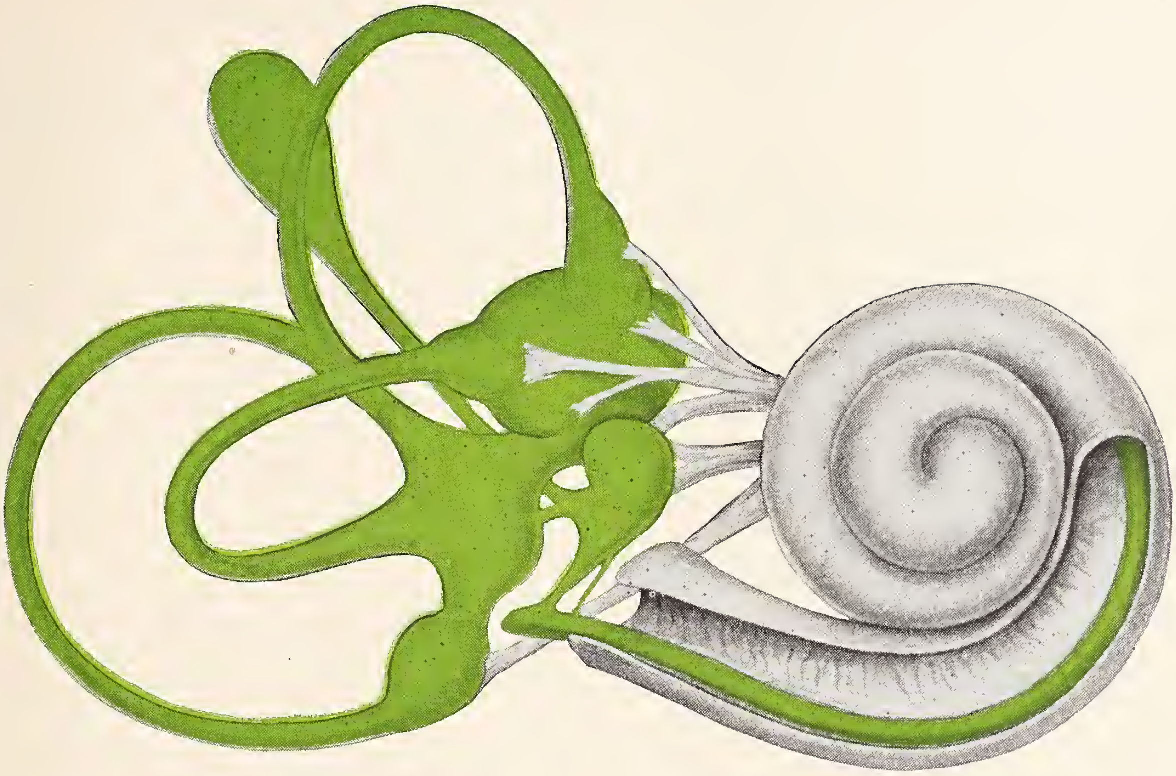
Dr. Hay: I would like to ask Dr. Fahr a question. I think the incidence of carcinoma of the stomach with pernicious anemia is somewhere around 8 per cent. How low would the surgeon have to get his mortality before he would advise operation?

Dr. Fahr: The atrophic gastritis goes on a long, long time before it becomes malignant. Then there comes a time when the patient comes for re-examination and you make the diagnosis that it is malignant. It is pretty hard to get the patients back for re-examination—not because a good gastroscopist cannot do it without the patients minding; what they do mind is coming back again and again and nothing coming of it. I would not require everyone with pernicious anemia to have a gastrectomy because most of these patients would not live long enough to develop carcinoma. A checkup with gastroscopy and gastrointestinal x-ray at six-month intervals would probably be attended with good results.

Dr. Hay: I think I would agree that with pernicious anemia the six-month interval should be recommended.

The meeting was adjourned.

Wallace P. Ritchie, M.D., *Secretary*



Detail of the Labyrinthine Structure

"The prophylactic value of Dramamine was conclusively demonstrated among 170 passengers who volunteered the information that they were unusually susceptible to motion sickness. . . . There was complete relief (freedom from any signs or symptoms of airsickness) in 152 cases or 89.5 per cent; . . . ."

PHYSICIANS' ART SHOW

The American Physicians' Art Association will have an art exhibit, as usual, during the AMA convention at Atlantic City, N. J., June 11 to 15. Any physician in the United States, Canada and Hawaii desiring to participate in this show should communicate with Dr. F. H. Redewill, Secretary, American Physicians Art Association, 760 Market Street, San Francisco 2, California, for particulars.

J. Henry Helser & Co., Inc., investment managers, are the new sponsors of the American Physicians Art Association and will award 200 trophies besides a special Helser Trophy—a large decorative cup depicting Yankee ingenuity. This cup is to be awarded for art work done in any medium. Also the large Popularity Trophy will be awarded to the owner of the art piece receiving the most popular votes during the AMA convention. Over 4000 members of the American Physicians Art Association shortly will receive entry blanks, shipping labels and rules about this fourteenth art exhibition.

The Annual Art Banquet will be held on the evening of June 12 at the Marlborough-Blenheim Hotel, Atlantic City, N. J.

POSTGRADUATE COURSE IN ALLERGY

A postgraduate course in allergy will be offered by the American Academy of Allergy on June 14, 15, and 16 in Montreal, Canada. It will be sponsored by the Faculty of Medicine, McGill University, and will be held at the Royal Victoria Hospital in Montreal.

Any interested physician in the United States or Canada may attend. Fee for the course is $40. Applications can be sent to Bram Rose, M.D., Royal Victoria Hospital, Montreal 2, Canada.

Sixteen speakers will present the course, nine of whom are on the faculty of medicine at McGill University. In addition to general allergy subjects there will be lectures on "Otorhinology in Relation to Allergy," "Allergic Dermatoses," "Allergy in Children," and "Psychiatric Aspects in Allergy."

AMERICAN COLLEGE OF CHEST PHYSICIANS

The seventeenth annual meeting of the American College of Chest Physicians will be held at the Ambassador Hotel, Atlantic City, New Jersey, June 7 through 10. An interesting scientific program has been arranged for presentation at the meeting.

The Board of Examiners of the College has announced that the next oral and written examinations for fellowship will be held in Atlantic City on June 7. Candidates who would like to take the examinations for fellowship should contact the Executive Secretary, American College of Chest Physicians, 500 North Dearborn Street, Chicago 10, Illinois.

The convocation ceremonies will be held at the Ambassador Hotel, Atlantic City, on Saturday, June 9, at which time certificates will be awarded to new fellows of the College.

Dr. John Briggs, Saint Paul, is a regent of the College; Dr. Herman J. Moersch, Rochester, serves as governor of the College for Minnesota. Dr. J. Arthur Myers, Minneapolis, will present a paper on "The Effect of the Diminishing Incidence of Primary Infection on the Tuberculosis Control Program" in the scientific program, and Dr. N. K. Jensen, Minneapolis, will present the subject of "Recovery of Pulmonary Function after Crushing Injuries of the Chest." The x-ray conference to be presented at the annual meeting will be conducted by Dr. Leo G. Rigler, Minneapolis.

GEORGE E. FAHR LECTURE

Dr. George E. Burch, professor and chairman, Department of Medicine, Tulane University of Louisiana, New Orleans, will deliver the first George E. Fahr Lecture on May 8 on the University of Minnesota campus. The lectureship, which will be given annually, is financed through a gift which former students of Dr. Fahr have presented to the Minnesota Medical Foundation.

Dr. Burch will also participate in a continuation course in electrocardiography for general physicians on May 7 to 11 at the Center for Continuation Study.

SISTER KENNY FOUNDATION SCHOLARSHIPS

The Sister Elizabeth Kenny Foundation, with national offices in Minneapolis, announces availability of Kenny therapist training scholarships totaling $5,400 each for registered nurses and physical therapists. Designed to qualify trainees to become Kenny therapists in the treatment of poliomyelitis, the twenty-four-month course will start June 20, 1951, in Minneapolis.

The purpose of the course is to prepare carefully-selected persons who are interested in scientific postgraduate training in the management of polio, under the supervision of physicians and according to the techniques established by Sister Kenny. Scholarships are paid at the rate of $225 per month, and tuition for all courses will be provided by the Kenny Foundation.

Persons who successfully complete the course for Kenny Therapists will be given a certificate by the Kenny Foundation. The certificate indicates the ability of the holder to treat polio and to supervise others in its management, according to the techniques established by Sister Kenny.

Upon graduation, Kenny therapists are assured of assignment to a Kenny treatment facility. Salaries start at $285 a month and reach $355 through automatic increases at six month intervals. Additional opportunities for advancement, with increased compensation, are available. Two weeks vacation with pay is provided after one year of service, three weeks after two years

Relationship of Stress to Autonomic Lability

Studies in psychosomatics have shown that functional disorders often are a result of the patient's inability to adjust to emotionally stressful situations (stressor factors).

Nervous tension and chronic anxiety, discharged through a labile Autonomic Nervous System, can cause somatic disturbance. [1,2.] Such states may involve any one of the organ systems or several at one time. [1,3.] The outline below is designed to relate gastrointestinal and cardiovascular symptomatology to the exaggerated response of the autonomic nervous system.

	Physiologic Effects of Autonomic Discharge	
	Sympathetic	**Parasympathetic**
Gastro-intestinal System	Hypomotility Intestinal Atony Hyposecretion Reduced salivation	Hypermotility Gastrointestinal spasm Hypersecretion
Cardio-vascular System	Rapid heart rate Peripheral vaso-constriction	Slow heart rate Vasodilatation
Functional Manifesta-tions	Palpitation Tachycardia Elevated blood pressure Dry mouth and throat	Heartburn Nausea-vomiting Low blood pressure Colonic spasm

The data here tabulated is from references [3,4,5,6,7,] given below.

When the clinical picture is suggestive of functional disorder, the diagnosis is supported by the presence of the following indications of autonomic lability:

Variable Blood Pressure
Body Temperature Variations
Changing pulse rate
Deviations in B. M. R.
Exaggerated Cold Pressure Reflex
Oculo-Cardiac Reflex Abnormalities
Glucose Tolerance Alterations

Therapy in these cases is directed toward: 1) relieving the somatic disturbance to prepare the patient for psychotherapy*; 2) guidance in making adjustment to stressful situations and correction of unhealthy attitudes.

*Drug treatment using adrenergic and cholinergic blocking agents in conjunction with sedatives. [8,9,10.]

Complete details and an application blank may be obtained by writing the Director of Training, Sister Elizabeth Kenny Foundation, 1800 Chicago Avenue, Minneapolis 4, Minn.

CONTINUATION COURSES

Atomic Medicine.—The University of Minnesota announces a continuation course in atomic medicine to be given to all physicians on April 26, 27, and 28. The course will emphasize the basis of and the effects of the atomic bomb with particular stress on pathological and clinical findings and organization for defense. Dr. George M. Lyon, chief of the Radioisotope Section of the Veterans Administration, Washington, D. C., will be the guest speaker. The course will be given without tuition. However, registration must be made early.

General Surgery.—A continuation course in general surgery will be given on May 17, 18, and 19 at the University of Minnesota Center for Continuation Study. This course is for general surgeons and physicians and will stress gastrointestinal surgery and diagnosis. Dr. Walter G. Maddock, professor, Department of Surgery, Northwestern University Medical School, Chicago, Illinois, will be the guest faculty member for the course.

Cardiovascular Diseases.—Dr. Irving S. Wright, professor of clinical medicine, Cornell University, New York City, will participate in a continuation course in cardiovascular diseases to be presented at the Center for Continuation Study, May 24 to 26. The course is sponsored by the Minnesota Heart Association and will emphasize the diagnosis and treatment of the most common cardiovascular disorders.

BLUE EARTH COUNTY SOCIETY

The Blue Earth County Medical Society has initiated an x-ray conference following their regular monthly meetings. These meetings are held on the last Monday of the month at 8:00 p.m. at the Mankato Clinic in Mankato, Minnesota. The x-ray conference is conducted by Dr. L. M. Hammar, roentgenologists at the Mankato Clinic. Physicians in the surrounding areas are invited to participate in this conference by bringing interesting and puzzling x-rays. They should be prepared to give a brief case history. Refreshments are served following the meeting. The conference has been well received by the Blue Earth County physicians.

The average public relations budget for state societies with 1,000 to 5,000 members in 1950 totaled about $16,000. In 1951, these societies are budgeting approximately $18,700 for public relations, an increase of more than $2,000 over 1950. Conversely, the larger societies (5.000 and over) who budgeted on an average of $72,800 in 1950 are alloting the reduced sum of about $65,000 for PR in 1951.

Societies under 1,000 members averaged about $6,600 for PR in 1950. Not enough 1951 budgets of these societies have been allocated at this time to compute the 1951 budget average.—*The PR Doctor,* March 14, 1951.

Woman's Auxiliary

WELCOME EXTENDED TO ANNUAL MEETING

Mrs. E. D. Rooke, President,
OHFD Medical Auxiliary

Dear Auxiliary Members:

We of the Olmsted-Houston-Fillmore-Dodge County Medical Auxiliary wish to invite you to come and see us at the state convention in Rochester, April 30, May 1 and 2.

We are looking forward to your visit. Plan to make your stay a long one—we shall try to make it a happy one.

GENERAL PROGRAM POINTERS OUTLINED

Mrs. David J. Halpern, Chairman
Program and Health Education Committee

1. Strive to make the auxiliary programs more instructive. Have specific programs, study and discuss these in meetings. Get *authentic* information so that facts can be given when a question is asked.

2. Vary ways of presenting the program. Get as many to participate as possible.

(a) workshop, (b) lecturer, (c) panel discussion, (d) movies.

3. Entertainment may be included. However, do not have the percentage of entertainment exceed the instructive part of the program. Any program worth giving time to is one which promotes further thinking or action of some sort.

4. Use pledge of loyalty to Woman's Auxiliary at local meetings.

5. Consult and seek advice of the local medical society before participating in any new program.

Program Material Listed

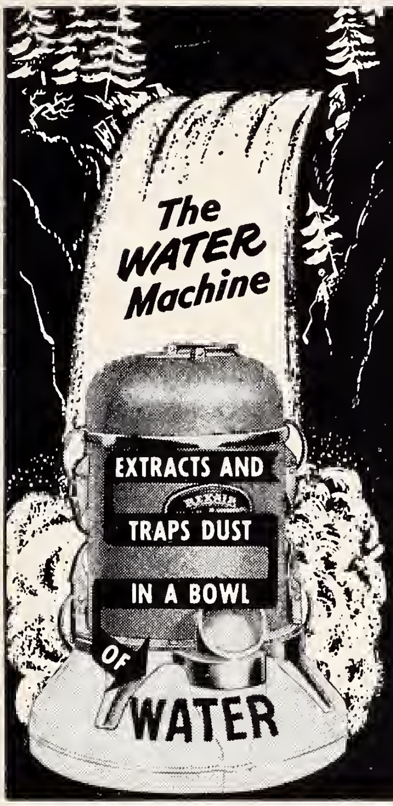
1. Continue to concentrate on legislative issues, especially National Compulsory Health Insurance. Be on the alert for "fringe bills."

2. Each community has different health problems. Know each community and discuss local health problems. Know and study local health agencies, develop a community health council and study the school health program.

3. The American Medical Association has its "Twelve Point Program." Five of these are especially suitable to the type of work auxiliary women are qualified to do. Number five, medical facilities, touches the rural health problem. The others are mental hygiene, public health, chronically ill and aged, and health education.

4. Study and promote "Today's Health," the National Bulletin, the Auxiliary page of Minnesota Medicine, and the Auxiliary Newsletters.

5. Members should familiarize themselves with the voluntary prepayment medical and hospital care plans in the state.



Rexair Traps Household Dust in Water

WASHES AIR, HUMIDIFIES, VAPORIZES, DOES ALL VACUUM CLEANING WORK, AND EVEN SCRUBS FLOORS!

Water is the secret of Rexair's dust-filtering action. Rexair—and only Rexair—passes the stream of dust-filled air completely through a churning bath of water, discharging clean, humidified air into the room. Rexair direct factory sales and service branches are listed in phone books of principal cities of United States and Canada. Call your local branch or write direct to:

REXAIR DIVISION, Martin-Parry Corporation
Box 964 ML41 • TOLEDO, OHIO

EXCLUSIVE WITH Rexair
Fully Guaranteed by a 69-Year-Old Company
OVER 1,000,000 SATISFIED USERS

6. Consider the possibility of a nurse recruitment program.

7. Each auxiliary should have a civilian defense program.

Each member should do her bit to "promote better health the American way." If all members do their part, the reports at the close of 1950-1951 will be most gratifying.

CHAIRMAN STRESSES PUBLIC RELATIONS

Mrs. L. J. Leonard, Public Relations Chairman

Public relations is actually twofold—informing the lay people how they may procure and better understand data relating to means of obtaining better health for them and their children and, convincing the public of the interest and sincerity with which the medical profession is striving to protect their future medical needs.

County presidents should avail themselves of the various radio scripts obtainable through the Minnesota State Medical Association office. They will help in either planning a radio program or arranging for spot announcements over local stations.

Many new and instructive health films on cancer, tuberculosis and diabetes may be shown to a community group in local high schools, where they have facilities to show sound films. Other films on civilian defense, which are very timely, may also be obtained.

Convince people of interest in their health, make known the available health facilities, encourage factual study and discussions of local problems, help church groups, associate with every type of health campaign such as TB seal sales, cancer drives and heart fund drives, etc.

Members hear continually of the great shortage in the nursing field. Plan programs, as some counties have done, where high school girls are entertained and the requirements and benefits of a nursing career explained to them. In this regard, perhaps a nursing scholarship could be contributed, as has been done in some county auxiliaries. Inquiry might also be made as to what hospitals offer scholarships—it might provide just the aid necessary to some girl who could not afford it otherwise.

The auxiliary is very proud of the success of the AMA advertising campaign conducted by Whitaker and Baxter. Advertisements appeared in 10,300 newspapers and Sunday supplements, fifty-five national magazines, and announcements were made over 1,600 radio stations. In addition, thousands of allied professions, lay organizations, business and industry added their support. Much has been accomplished but a great deal remains to be done. Many people still do not know the facts.

As a suggestion to further inform the general public, why wouldn't it be a good idea to encourage high school debating on this subject? So much positive material is available for their use and it would be one way of getting authentic information to them. The State Medical Association office, 496 Lowry Medical Arts Building, St. Paul 2, can supply this data.

Those members who have not read "Santa Claus, M.D." written by Dr. W. W. Bauer, should surely resolve to do so. It is a 220-page book, humorous and statistical, and explains just why the voluntary way is the American way. After reading it, members will have a very good foundation of fact which they need not hestitate to expound. It sells for $2.75 and may be obtained from the Bobbs-Merrill Company, Inc., Indianapolis 7, Indiana, or the book departments of most department stores.

In Memoriam

ELLERY LESLIE ARMSTRONG

Dr. E. L. Armstrong, specialist in eye and ear disease at Duluth, Minnesota, died on January 2, 1951, after a brief illness.

Dr. Armstrong was born in Minneapolis, August 19, 1889. He graduated from the University of Minnesota medical school in 1916 and interned at the University Hospital in Minneapolis.

He practiced at Park Rapids from 1916 to 1919 before taking postgraduate work in ophthalmology and otolaryngology at the University of Minnesota from 1919 to 1921.

Dr. Armstrong was a Fellow of the American College of Surgeons and of the American Academy of Ophthalmology and Otolaryngology. He was a member of the St. Louis County Medical Society, the Minnesota State Medical Association and the American Medical Association. He was also a member of the Pilgrim Lutheran Church, the Scottish Rite Masons, the Duluth Kiwanis Club and Phi Beta Pi medical fraternity.

He is survived by his wife, three sons, Dr. Frederick Armstrong of Minneapolis, Leslie and Robert of Duluth, and a daughter, Sally, also of Duluth.

S. JOHN LEHMAN

Dr. S. J. Lehman, of Brainerd, died January 10, 1951, at a hotel in St. Cloud, Minnesota. He was thirty-two years of age.

Dr. Lehman was born at Glendive, Montana, February 18, 1918. He graduated from the University of Minnesota medical school in 1943 and interned at Miller Hospital in Saint Paul. He spent three years taking postgraduate work at the University of Minnesota and was a year with Dr. Frank E. Burch of Saint Paul.

He had been with the Bratrud Clinic at Thief River Falls before locating at Brainerd. He was a veteran of World War II and a member of the Plymouth Lodge, A. F. & A. M., Minneapolis, the Elks and Eagles lodge and the Rotary Club.

Dr. Lehman was married in 1942 to Bernice Lundgren of Minneapolis. Surviving are his widow and triplet daughters, Nancy, Susan and Caryl. A brother, six sisters and his parents, Mr. and Mrs. S. S. Lehman of Lindsey, Montana, also survive him.

RAY B. McCARTY

Dr. Ray B. McCarty died April 15, 1950, at Riverside, California.

Ray McCarty was born at Corona, California, September 1, 1899. He received his A.B. degree from the University of California in 1921 and his M.D. degree from the University of Pennsylvania in 1925. He entered the Mayo Foundation October 1, 1927, received the degree of Master of Surgery from the University of Minnesota in 1930 and was a resident surgeon at Colonial Hospital until 1931. He had practiced surgery in Riverside, California, since 1931.

Dr. McCarty was a member of Alpha Omega Alpha, Nu Sigma Nu and Sigma Pi fraternities and also of the American College of Surgeons.

EDWARD T. SANDERSON

Dr. Edward Theodore Sanderson, eldest son of Dr. Samuel E. and Elisa Sanderson, was born April 20, 1875, in Boone, Iowa. In his early childhood, the family moved to Minneota, Minnesota, where his father began the practice of general medicine. In his mid-teens it became necessary for him to assume full responsibility for his own support. He worked for several years as auditor for the C. A. Smith Lumber Company traveling between various mid-west towns, and for two years as a bank cashier. He then resumed his education by attending St. Olaf Academy, Northfield, Minnesota, from 1900-1901. The following year he matriculated at Bennett Medical College, the present Loyola University Medical School, of Chicago, Illinois, from which he received his medical diploma in 1905.

Following his graduation, he became professor of Anatomy and secretary and registrar of the College and maintained an office in Chicago for one year. He was married on December 31, 1906, to Miss Harriet Wallin of Eastman, Wisconsin. Due to his father's ill health, he returned to Minneota where he assumed the medical practice and served the community in that capacity for forty years. His practice was typical of the horse and buggy doctor of that era. During his active years, he delivered more than 5,000 babies in addition to his general medical practice. In 1945, he was forced to retire because of illness.

Dr. Sanderson held a long record in the service of the state medical profession. In 1917, he was appointed to the first State Advisory Commission on Tuberculosis. This commission carried on the first work in the investigation of tuberculosis by the State of Minnesota. After five years of service on this commission, he was appointed to the State Board of Medical Examiners in 1922. He remained on the board until 1932 and served as president and executive secretary for several years. This was the first time in the history of the state that the secretaryship of the examining board had been earned by a country doctor. He was president of the Minnesota State Medical Association in 1924. He was one of the founders and a past president of the Lyon-Lincoln Medical Society. In addition to these honors by the State of Minnesota, he was awarded citations and medals from the Presidents of the United States for the examination of selectees in both World Wars. He was a member of the American Medical Association, the Minnesota Medical Association and the Lyon-Lincoln Medical Society during his entire practice.

He served as mayor and councilman of Minneota for several terms and was president of the school board of the Minneota Public Schools for many years.

EDWARD T. SANDERSON

(Continued from Page 372)

For the past five years, he and Mrs. Sanderson have lived in Alexandria, Minnesota, where he passed away on March 16, 1951 at the age of seventy-six years.

He is survived by his widow, Mrs. Harriet W. Sanderson; four children: Mrs. George W. Clifford of Alexandria, Minnesota; Edward W. of New York, New York; Dr. Eric R., of Seattle, Washington; Margaret H. of Chicago, Illinois; and seven grandchildren. He is also survived by a brother, Dr. A. G. Sanderson of Anoka, Minnesota, and a sister, Miss Sara T. Sanderson of Albuquerque, New Mexico.

Funeral services were held at the First English Lutheran Church in Alexandria, Minnesota, on March 20, 1951, with Reverend Martin T. Jensen officiating. Interment was at Kinkaid Cemetery, Alexandria.

MARK H. TIBBETTS

Dr. Mark H. Tibbetts, orthopedic surgeon of Duluth, died January 28, 1951, in his hotel room while in Chicago attending a convention of orthopedic surgeons.

Mark Tibbetts was born at Ogden, Iowa, September 18, 1889. He attended Parsons College at Fairfield, Iowa, where he obtained a B.S. degree in 1912. His M.D. degree was obtained from Johns Hopkins Medical School in 1917. He interned two years at Johns Hopkins Hospital, Baltimore.

Dr. Tibbetts was a member of the St. Louis County Medical Society, the Minnesota State Medical Association and the American Medical Association.

MICHAEL ZLATOVSKY

Dr. Michael Zlatovsky of Duluth died January 15, 1951, at the age of seventy. He was born in Russia, July 1, 1876.

Dr. Zlatovsky graduated from the University of Kiev in Russia in 1912 and had practiced in Duluth since 1923. He became naturalized in 1929.

He was formerly a member of the St. Louis County Medical Society, the Minnesota State Medical Association and the American Medical Association.

Dr. Zlatovsky is survived by his son, George, of Paris, France, and his daughter, Mrs. Michael Tennenbaum of Chicago.

Still more recently, another influence has risen to increase the demand for hospitals. This is voluntary insurance against the costs of medical care. When such protection is carried, it is perhaps a human trait to exploit it. Someone has said that there is a curious defect in our moral code that makes it no crime to defraud an insurance company. The instance of so-called health insurance appears to support this contention. Too often, and perhaps without realizing that he is abusing his privilege and thereby raising the cost of insurance, the protected person demands hospitalization for causes not specified in the benefits. It is not easy for a physician, however conscientious, to oppose such a demand. The constantly increasing utilization of the benefits of voluntary medical-care insurance has added to its cost almost as much as has the rising cost of hospital operation.—Paul R. Hawley, M.D., New England Journal of Medicine, February 15, 1951.

Of General Interest

Dr. Kenneth L. Nelson announced on March 14 that he had terminated his practice in Balaton and was moving from the city. The reason for his move was said to be the unavailability of rental property for housing. Dr. Nelson had practiced in Balaton for slightly more than one year.

* * *

At a meeting of the board of directors and medical staff of the Riverview Memorial Hospital, West Saint Paul, on March 14, **Dr. Kano Ikeda** of Saint Paul spoke on new laboratory facilities for the hospital. Chief topic of discussion at the meeting was ways and means of improving the hospital.

* * *

Dr. A. W. Adson, Rochester, was principal speaker at a meeting of the Optimist Club in Saint Paul on March 15. He discussed the advances made by medical science.

* * *

Dr. Thomas J. Devereaux, Wayzata, suffered a fractured ankle and a wrist when he slipped on an icy street while making a professional call in Minneapolis on March 7.

* * *

The new twenty-two-story **Mayo Memorial Medical Center**, which is now under construction, at the University of Minnesota, will not be enough to meet the medical school's need for space during the next fifty years, a medical school committee reported early in March. The committee was headed by **Dr. Gaylord W. Anderson,** director of the School of Public Health.

The committee suggested that in the long-range program space would be needed for research in various fields, facilities for convalescent care, expanded facilities for rehabilitation work, a "hospital-hotel" for outpatients, relocation of the state health department building and the pharmacy building, housing facilities for students and staff members, and greatly increased parking areas.

* * *

Dr. J. G. Beaton, formerly a staff member of the Veterans Hospital at Fargo, North Dakota, has become affiliated with the Fritsche Clinic in New Ulm. He is specializing in the practice of internal medicine.

A graduate of the University of Minnesota Medical School, Dr. Beaton served his internship at the Marine Hospital in Baltimore, Maryland. He then joined the U. S. Public Health Service and was assigned to the Coast Guard. He also served on a troop transport in the Pacific. Following his discharge from service, he took postgraduate work at the Wayne County General Hospital in Detroit, Michigan. In June, 1948, he joined the staff of the Fargo Veterans Hospital, where he specialized in internal medicine.

After six months without a resident physician, Erskine acquired one on February 26 when **Dr. Lawrence O. Pearson** opened offices there for the practice of medicine. Dr. Pearson formerly practiced at Pelican Rapids.

* * *

Dr. Gilbert S. Wheeler, formerly of Portland, North Dakota, became associated in practice with **Dr. D. O. Berge** in Roseau on February 24. A graduate of the University of Manitoba Medical College, Dr. Wheeler practiced at Portland for the past two years.

* * *

Principal speaker at a meeting of the Stewartville Parent-Teacher Association in Stewartville on February 8 was **Dr. E. D. Henderson** of Rochester. He spoke on "Common Foot Ailments in Children."

* * *

Dr. John M. Grogan announced on March 1 that he was planning to discontinue his medical practice in Ceylon. He stated that shortly after June 1 he was going to move to Denver, Colorado, to study radiology at the Colorado General Hospital. Dr. Grogan has practiced at Ceylon since April, 1946.

* * *

Dr. Harold S. Diehl, dean of medical sciences at the University of Minnesota, was one of several witnesses before a Senate subcommittee early in March in Washington, D. C., investigating the dismissal of Dr. Paul Magnuson as Veterans Administration medical director. Dr. Diehl warned the subcommittee that Veterans Administration policies may damage medical care programs in VA hospitals in Minnesota and throughout the country.

As chairman of the dean's committee for the Minneapolis Veterans Hospital, Dr. Diehl said that "over the past couple of years it has become increasingly difficult to get many things done which in the judgment of the staff are important to the program." He stated that "more and more matters must be referred to Washington, frequently with extensive correspondence, prolonged delays, and all too frequently with final decisions made on the basis of the average VA hospital without regard to the local situation."

* * *

Dr. Charles E. Rea, Saint Paul, was the guest speaker at a meeting of the Faribault Business and Professional Women's Club on March 5 in Faribault. He spoke on the subject of socialized medicine.

* * *

Early in March the **University of Minnesota** received a grant of $56,423 from the United States Public Health Service for research on cancer, C-reactive proteins, gastric secretion, experimental diabetes study, influence of aureomycin, and research on the effect of blood glucose levels in rats.

Dr. John E. Hildebrand, formerly of Detroit, Michigan, has become associated in practice with **Dr. J. K. Hartjen** in Bemidji. A graduate of Wayne University in Detroit, Dr. Hildebrand has had postgraduate training in obstetrics and pediatrics.

* * *

In a special appeal to the State Legislature on March 12, **Dr. Ralph Rossen,** mental health commissioner of Minnesota, described the crowded conditions still existing in state mental hospitals. His report of the serious overcrowding was based on personal visits made to several state hospitals by a special committee, including himself.

Dr. Rossen called on the Legislature to create an interim commission consisting of at least three legislators, two or three physicians and at least one hospital superintendent to investigate the problem. He stated that "once the legislators see the picture, I am sure that they will come to the patients' aid."

* * *

Dr. Frederick A. Figi, Rochester, presented a paper entitled "Plastic Procedures about the Eyelids" at a meeting of the Minnesota Academy of Ophthalmology and Otolaryngology in Minneapolis on March 9.

* * *

Dr. James J. Anderson, who formerly practiced in Saint Paul, has moved to Mankato and opened offices for the practice of medicine. He specializes in obstetrics and gynecology.

* * *

Dr. Florence Jacqueline Bouthilet, Saint Paul, was married to Kenneth Benjamin Fick, Minneapolis, on March 31. The wedding was held in Immanuel Lutheran Church. Dr. Bouthilet is a graduate of the University of Minnesota Medical School.

* * *

Guest speaker at a meeting of the Mankato Business and Professional Women's Club on February 20 was **Dr. John J. Eustermann** of the Mankato Clinic. The title of his talk was "Recent Advances in the Treatment of Heart Disease."

* * *

Two Minneapolis physicians were among the guest speakers at the fourteenth annual meeting of the New Orleans Graduate Medical Assembly in New Orleans on March 5 through 8. They were **Dr. Albert V. Stoesser** and **Dr. John L. McKelvey.**

Dr. Stoesser spoke on "Use of Cortisone and ACTH in Diseases of Children," "Atopic Eczema in Infancy and Early Childhood," and "New Concepts in the Therapy of Respiratory Infection in Children."

Dr. McKelvey discussed "Studies of the Therapy of Adenocarcinoma of the Endometrium," "Endometrial Hyperplasia and Some of Its Problems," and "Tuberculosis of the Female Generative Tract."

Dr. M. Y. Colby, Jr., and **Dr. M. M. D. Williams,** both of Rochester, presented papers at the meeting of the Minnesota Radiological Society in Minneapolis on February 24. Dr. Colby's paper was entitled "The Effect of X-Rays on the Normal Gland." The title of Dr. Williams' paper was "New Tools for the Radiologists."

* * *

Dr. Harry A. Palmer, Blackduck, was host on February 15 to staff members of the Bemidji Clinic who went to Blackduck to inspect Dr. Palmer's new clinic building, equipment and facilities. Included in the group entertained by Dr. Palmer were **Dr. W. J. Deweese, Dr. D. D. Whittemore** and **Dr. H. M. Wikoff** of Bemidji.

* * *

After practicing at Jordan since 1948, **Dr. Frederick M. Hass** has moved to Minneapolis to take over the practice of a physician called into the Armed Services.

* * *

Seventeen fellowships were recently awarded to employment and placement counselors for a special course designed to help meet the employment problems of handicapped workers. The fellowships, totaling $5,000, were for a course held in New York from March 12 to April 6 and were awarded jointly by Alpha Gamma Delta, international women's fraternity, and the National Society for Crippled Children and Adults. The counselor training course was part of the national cerebral palsy program started five years ago to provide treatment, training and employment services for victims of cerebral palsy. The purpose of the counselor training program is to encourage public and private agencies to increase their services for the severely handicapped.

* * *

It was announced on March 8 that the Rockefeller Foundation had awarded a grant of $27,300 to the **Dight Institute** at the University of Minnesota for research in human genetics. The grant, which becomes available on July 1 for a three-year period, will be used to develop better methods of aiding people with problems in human genetics.

HOSPITAL NEWS

Results of recent staff elections at several Minnesota hospitals are as follows:

Dedication ceremonies for the new **Renville County Hospital** at Olivia were held on January 21. Principal speaker at the dedication of the forty-bed hospital was Dr. John S. Lundy, head of the section on anesthesiology at the Mayo Clinic, Rochester. Following the ceremonies, conducted tours of the hospital were available to the public.

A tentative medical staff for the hospital was organized at a meeting in Olivia on February 19. Elected as tentative staff officers were Dr. J. A. Cosgriff, Sr., Olivia, chief-of-staff; Dr. C. A. Anderson, Hector, vice chief-of-staff, and Dr. H. P. Hindereker, Bird Island, secretary.

* * *

It was announced on January 4 that the Sisters of St. Francis had decided to proceed with construction of the new **St. Francis Hospital** in Shakopee without waiting for federal grants of funds. The hospital will be financed from pledges amounting to more than $200,000, obtained in a campaign last summer, plus a private loan negotiated by the Sisters. The loan will raise the fund available to $450,000. It was expected that actual construction work on the hospital would begin late in the spring.

The University of Minnesota Hospitals have the "highest of any known" five-year survival rate for gastric cancer patients, according to a statistical study released on March 6 by three United States Public Health doctors who are medical fellows in surgery at the University.

In the study it was reported that 12.2 per cent of 404 gastric cancer patients who entered the University Hospitals between 1940 and 1945 have survived five years or more.

The report also pointed out that mortality rates in operations removing part of the stomach for gastric cancer have decreased from 41 per cent in 1946 to 11.4 per cent in 1949, with a low of 3.7 per cent in 1948.

BLUE CROSS AND BLUE SHIELD NEWS

Minnesota Medical Service, Inc., on January 1, 1951, revised the code numbers in the "Schedule of Payments" to doctors according to the Blue Cross-Blue Shield Actuarial and Statistical Manual. This change actually represents no deviation in fees paid or services allowed under the former Minnesota Blue Shield Schedule of Payments, but does change from the three-digit code number to a four-digit diagnosis code conforming with the International Morbidity Code. The revised "Schedule of Payments" will be distributed to the medical profession of Minnesota about May 1, 1951. The purpose of this uniform coding is to give Blue Shield plans, on a nationwide basis, accurate statistical data.

Last month this column discussed briefly some aspects of the delay in payment of Blue Shield claims. It may be helpful to the medical profession to outline here the factors which govern the rejection of Blue Shield claims.

Consistently over a period of six months the leading reason for rejection has been presentation of claims for patients who do not hold a Blue Shield contract. Another leading factor is the rejection of claims on which the required ten-month waiting period had not been completed. The third leading reason for disallowance involves cases in which the type of service or care rendered is not within the provisions of the contract.

The patient usually considers his attending physician's opinion as final on questionable cases. Much confusion and ill-will could be eliminated, as well as much time saved in both the physician's and the Blue Shield office, if the following information could be passed on to the patient directly from the doctor's office:

If the patient holds no Blue Shield contract, there is no advantage in filing a Blue Shield claim.

If the Blue Shield contract has not been in effect for ten consecutive months, no allowance can be provided for (1) obstetrical care, (2) tonsillectomies and adenoidectomies performed on minor dependents, and (3) for the treatment of conditions known to exist at the time the

Blue Shield application is received in the Blue Shield office. To give questionable cases of foreknown conditions every possible consideration, medical history and data is requested from both the subscriber or patient and also from the attending physician, after which cases are given careful and thorough study.

If the services are for the treatment of a medical condition in the home or office, for consultation services either in the hospital or office, or for dual service, no allowance can be made.

This phase of professional-public relations can most effectively be carried out through the physician's office since therein lies the crux of the liaison between Blue Shield and the Blue Shield contract holder.

Total enrollment in Blue Shield as of January 31, 1951, was 419,761 participant subscribers, an increase of 135,874 over the same date of 1950.

There were 3,479 claims paid for January, totaling $123,869.35. Of these claims 514 were for services given in January, 1,579 for services in December and 710 for November, the balance dating from June, 1949, through October, 1950. The total payments of January claims represent 42.6 per cent of cash earned income compared with 55.4 per cent of cash earned income for January, 1950.

Please note that Cedric Adams, news commentator, will make spot announcements regarding our Blue Cross-Blue Shield non-group campaign, beginning April 2, at 6:45 p.m. on Mondays, 7:30 p.m. on Tuesdays, 6:30 p.m. on Wednesdays, 6:00 p.m. on Thursdays, 6:15 p.m. on Fridays, and 7:30 p.m. on Saturdays.

BOOK REVIEWS

Books listed here become the property of the Ramsey, Hennepin and St. Louis County Medical Libraries when reviewed. Members, however, are urged to write reviews of any or every recent book which may be of interest to physicians.

Books Received for Review

THE USE OF PEDICLE FLAPS OF SKIN IN PLASTIC SURGERY OF THE HEAD AND NECK. Gordon B. New, M.D., F.A.C.S., Professor of Plastic Surgery, and John B. Erich, M.D., F.A.C.S., Associate Professor of Plastic Surgery. Both of Graduate School, University of Minnesota, Minneapolis, and Section on Laryngology, Oral and Plastic Surgery, Mayo Clinic, Rochester, Minnesota. 104 pages. Illus. Price $3.00, flexible binding. Springfield, Illinois: Charles C. Thomas, 1950.

UNITED STATES CIVIL DEFENSE. Health Services and Special Weapons Defense. Federal Civil Defense Administration. 260 pages. Illus. Price 60c. Washington, D. C.: United States Government Printing Office, 1950.

PARACELSUS—Magic Into Science. Henry M. Pachter. 360 pages. Illus. Price $4.00, cloth. New York: Henry Schuman, Inc., 1951.

PAUL EHRLICH. Martha Marquardt. With an introduction by Sir Henry Dale. 255 pages. Illus. Price $3.50, cloth. New York: Henry Schuman, Inc., 1951.

PHYSICIANS' AND NURSES' CONCISE MEDICAL ENCYCLOPEDIA. William H. Kupper, M.D. 450 pages. Illus. Price $7.50, cloth. Los Angeles, California: Biblion Press, 1950.

In the preface of this encyclopedia, the author states that it is "an attempt to bridge the gap between medical dictionaries which say too little about too much, and the medical tomes which say too much about too much." That is precisely what the book is.

Brief descriptions are given of diseases and drugs, anatomic structures and physiologic processes, histologic findings and pathologic conditions. The book contains a tremendous amount of information on numerous and widely varied subjects. It does not go into technical detail, yet gives far more information on each subject than is found in the standard medical dictionary.

The illustrations, which are scattered throughout the book, are poorly reproduced and of little value. The book, however, is easily read and is a useful compilation of facts for physicians and nurses.

—J.H.L.

THE PREPARATION OF PHOTOGRAPHIC PRINTS FOR MEDICAL PUBLICATION. Stanley J. McComb, F.B.P.A., Section on Photography, Mayo Clinic, Rochester, Minnesota. 69 pages. Illus. Price $2.00, flexible binding. Springfield, Illinois: Charles C. Thomas, 1950.

In this brief monograph the author offers suggestions for the correction and improvement of many of the defects often found in published medical illustrations.

First he describes the factors to be considered in taking medical photographs—sharpness of focus, scale-size and position, background, lighting, emphasis, and types of films. In the last one-third of the volume he discusses the making of prints, improving print quality, and trimming and grouping prints for publication.

The author's suggestions are emphasized by good illustrations showing the right and wrong approaches to each problem.

Though not intended to be a comprehensive textbook on medical photography, this monograph should be of value to all persons who do medical writing that is to be illustrated with photographic reproductions. The advice of the author, if followed, should greatly reduce the number of poorly planned and poorly executed photographs that are submitted with papers to medical journals.

—J.H.L.

RENAL DISEASES. By E. T. Bell, M.D., Professor of Pathology, University of Minnesota, Minneapolis. Second edition. 448 pages. 123 illustrations and 4 plates in color; 71 tables and charts. Price, $8.00. Philadelphia: Lea & Febiger, 1950.

The author, in his first edition, presented a concise correlation of the anatomy, the physiology and the pathology of the kidney, with the terminology of clinical medicine. By his analysis of his findings, he succeeded in clarifying many controversial points.

His second edition has incorporated the findings of an additional 18,000 autopsies. He has enlarged several sections to include the more recent advances and concepts.

The orderly style of presentation, the clear self-explanatory tables and the numerous excellent illustrations combine to make this monograph the outstanding work on the kidney.

C.K.W.

THE MASK OF SANITY: Hervey Cleckley, M.D., Professor of Psychiatry and Neurology, University of Georgia School of Medicine, Augusta, Georgia. 2d ed. 569 pages. Price $6.50. St. Louis: C. V. Mosby Co., 1950.

This second edition of Cleckley's well-known book on "psychopathic personality" constitutes an extensive revision and extension of the original work. As before, the book to a considerable degree consists of case histories, which unfortunately are somewhat popularized and seem designed to shock and fascinate more than to elucidate. Particularly lacking in this regard is material

which would allow one to understand the early psychological factors involved in these cases. The same superficiality of investigation into possible psychodynamics is seen in the author's description of pathogenesis.

Criticisms cannot be made about the thorough coverage of the social implications of this condition, the descriptions of psychopathic variants, and the well thought-out ideas as to treatment and handling.

The book is easy and interesting to read and uses language with care. Its proper place in the literature is certainly not that of a book for popular consumption because of its sensationalist nature, but it is a valuable book for the mature physician and psychiatrist.

Medical Economics

(Continued from Page 356)

community has the responsibility in seeing that a workshop and tools are provided to bring in a first-class doctor to practice the skills he has learned. "Health, as well as education, is a local responsibility," Dr. Murphy said, adding that people should be prepared to put up adequate funds for rural health needs.

Dr. Murphy explained, that in terms of health service, there are three major factors:

1. The quantity and distribution of medical personnel and facilities;
2. The quality of that medical care;
3. The economics of medical service—ability of the population to purchase the medical service.

He said that when one considers the development of any kind of progress in health, all three factors play a role in the problems that presently exist, and those problems are integrated and interrelated to a great extent.

Dr. Murphy warned rural communities that they must remember that they are in competition with urban communities for scarce medical personnel, and that the young physician doesn't like to become medically isolated—"the community must be the magnet for young doctors."

". . .*in the minds of men*. . ."

In treating the disorders that exist in the minds of men, psychiatric nursing plays a vital role. Proper care can be given patients only by properly trained psychiatric nurses.

In view of the present shortage of such trained nurses, and the desperate need for them, the Glenwood Hills Hospitals School of Nursing, Neurology and Psychiatry is appealing to you physicians for aid in solving this problem.

By sending us the name of a promising nursing candidate in your community—a girl aged seventeen or over, with a high school education—you will be doing your part to alleviate this critical nursing shortage.

Our one-year course in psychiatric nursing is tuition-free. Our graduates have an excellent professional career before them.

Please send the name of a potential nursing recruit to

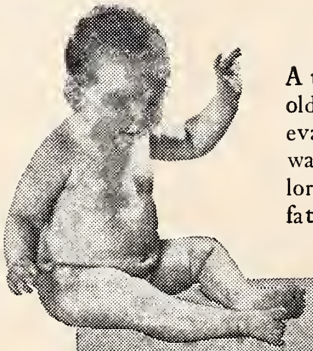
A necessity for a well balanced infant formula

Added carbohydrate plays an essential role in the infant formula. In adequate amounts, carbohydrate:

1. Permits normal metabolism of fat, thus preventing acidosis.
2. Promotes optimum weight gain.
3. Allows protein to be used to build new tissues rather than to provide calories.
4. Encourages normal water balance.

Cow's milk—Dextri-Maltose® formulas, successful for 40 years, provide optimum amounts of protein, fat and carbohydrate. In accordance with recommendations of authorities, approximately 15% of the calories are supplied by protein, 35% by fat, 50% by carbohydrate.



A typical formula for a 4-month-old infant would consist of 12 oz. evaporated milk, 20 oz. boiled water, 6 tbsp. Dextri-Maltose. Caloric distribution: protein, 15%; fat, 39%; carbohydrate, 46%.

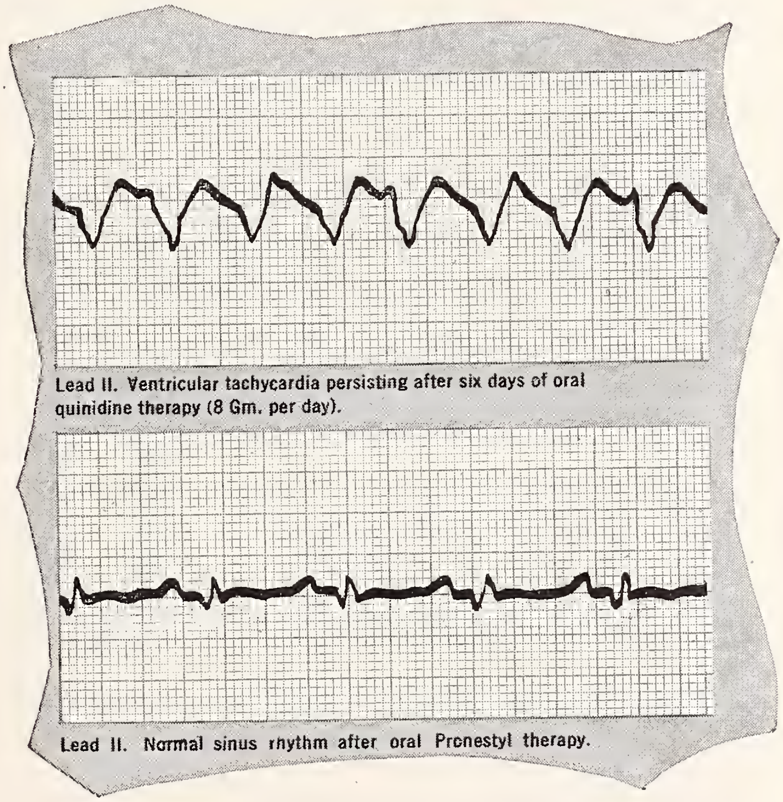
a new drug . . .
for the treatment of ventricular arrhythmias

PRONESTYL *Hydrochloride*
Squibb Procaine Amide Hydrochloride



Lead II. Ventricular tachycardia persisting after six days of oral quinidine therapy (8 Gm. per day).

Lead II. Normal sinus rhythm after oral Pronestyl therapy.

Oral administration of Pronestyl in doses of 3-6 grams per day, for periods of time varying from 2 days to 3 months, produced no toxic effects as evidenced by studies of blood count, urine, liver function, blood pressure, and electrocardiogram. Pronestyl may be given intravenously with relative safety.

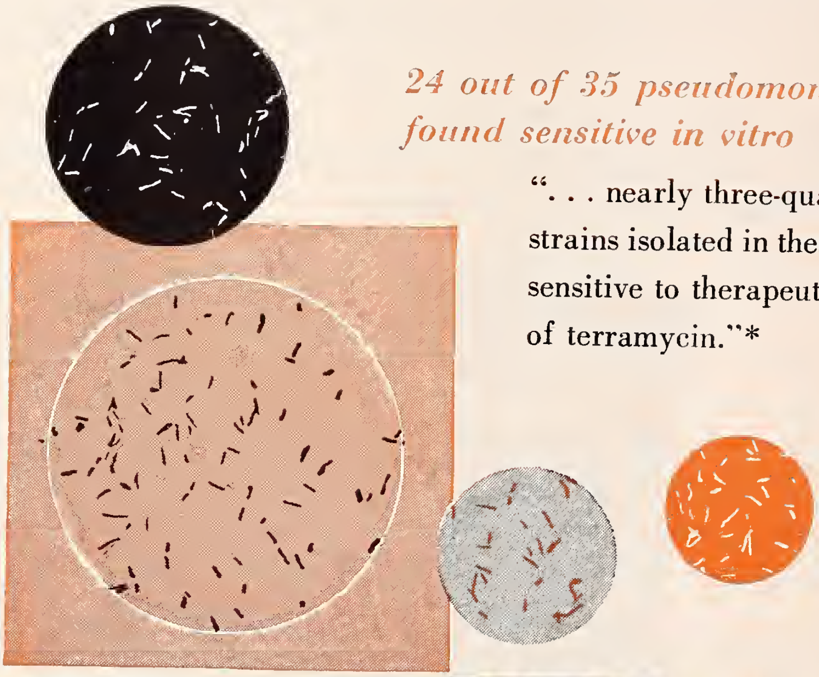
PRONESTYL IS A TRADEMARK OF E. R. SQUIBB & SONS

Pronestyl Hydrochloride Capsules, 0.25 Gm., bottles of 100 and 1000.
Pronestyl Hydrochloride Solution, 100 mg. per cc., 10 cc. vials.

For detailed information on dosage and administration, write for literature or ask your Squibb Professional Service Representative.

SQUIBB MANUFACTURING CHEMISTS TO THE MEDICAL PROFESSION SINCE 1858

"... OFFERS REAL PROMISE



24 out of 35 pseudomonas strains found sensitive in vitro

"... nearly three-quarters of the strains isolated in these laboratories are sensitive to therapeutic concentrations of terramycin."*

CRYSTALLINE

Terra

Bacterial resistance usually not a problem

"During the treatment of the cases described, no resistant mutants of originally sensitive strains have appeared; particular attention in this respect has been paid to strains of coliform bacilli in urinary infections. In vitro experiments indicate that with some coliform strains a slow step-like resistance can be evoked, but there has so far been no occurrence of any 'streptomycin-like' resistance."*

Ophthalmic Solution, 5 cc. dropper-vials, 25 mg. for preparation of topical solutions.

diagnosis during THE SILENT PERIOD

Routine testing with Ames diagnostic tablets in the office, home or hospital is frequently rewarded by the discovery of unsuspected pathology during the "silent period"—when disease in its incipiency may be most easily managed or cured.

Ames tablet tests are completely self-contained, rapid and clinically reliable.

The $64,000,000,000 Question Is

Why do Professional people think their accounts are different from commercial accounts? Our answer is "No Difference."

Your patients have the same jobs
Your patients have the same income
Your patients have the same debts
Your patients have the same habits
Your patients have the same excuses

Commercial enterprises collect systematically, leaving the Professional class holding the bag.

The wheel that squeaks gets the grease.

Psychological warfare commences immediately upon your forwarding your accounts for credit control and collection service.

The services offered by the Professional Credit Protective Bureau "Division of I. C. System" have been adopted by over 50 trade associations extending from coast to coast.

After twelve years in the liquidation of professional accounts receivable, you will be able to benefit by our experience.

Not A Collection Agency — All Monies Paid Directly To You

COST less than collection through your own efforts and in most cases one-half of usual collection agency fees.

Operates with extreme courtesy and goes to the fullest extent the law permits.

Our contention is that this is the outstanding credit control and professional collection service in the United States.

- NO ASSIGNMENT OF ACCOUNTS
- RETAINS PATIENTS' GOOD WILL

When you want money bad—we offer a service that is good!

When the dieter prepares the family fare

By curbing the appetite and elevating the mood, Desoxyn Hydrochloride helps to fortify the patient's resistance to constant temptation. Compared with other sympathomimetic amines, Desoxyn is more potent, weight for weight, so that smaller doses may be used effectively. One 2.5- or 5-mg. tablet before breakfast and another about an hour before lunch are usually sufficient to still the pangs of hunger. With Desoxyn you can expect a low incidence of side-effects plus faster action and longer effect than with other sympathomimetic amines. Try it. Abbott

Stainless Steel

Solid One Piece

AUTO EMBLEMS

The only auto emblem made of one piece Stainless Steel. Clean, smooth edge; polished to a satin finish. Letters and Caduceus are CAST Solid BRONZE, electrically riveted. Truly a craftsman's finished product. Complete with nut and bolt for attaching to car.

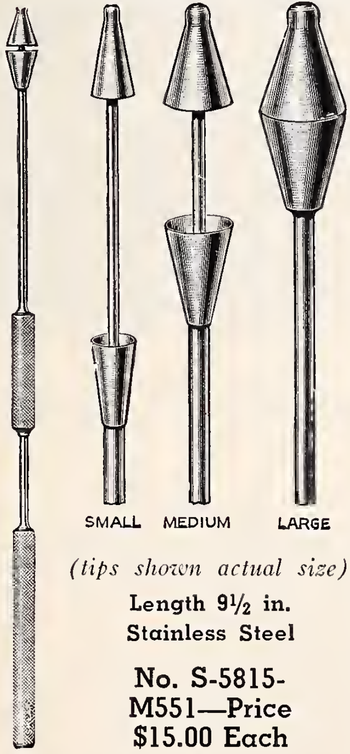
No. 500-M551—Price $4.95

CASTLE STERILIZER

Its "Full-Automatic" control guarantees real boiling temperatures at all times. It runs itself and saves nurses' time. Can be mounted on a stand, wall bracket or merely placed on a table top to save space. Scientifically modernized with new pilot light, it provides automatic low water protection and safety. Leak-proof, Cast-In-Bronze Boiler, guaranteed for a lifetime. Chrome finish with lasting high polish.

No. C-416-M551—16"—Price $90.00

Gusberg ENDOCERVICAL BIOPSY CURETTE



(tips shown actual size)

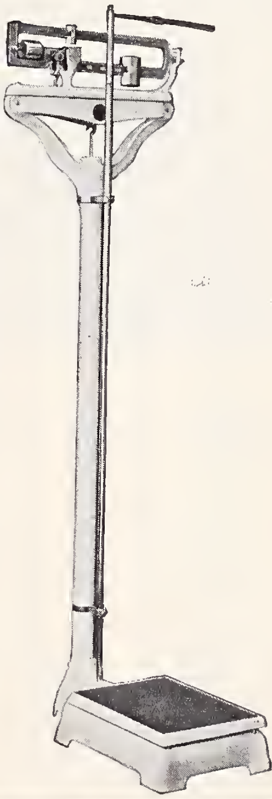
Length 9½ in.
Stainless Steel

No. S-5815-M551—Price $15.00 Each

This biopsy curette is designed to secure a cone of tissue from the squamous-columnar junction of the cervix as an aid to the detection of early cancer. It may be used for tissue confirmation with the vaginal smear screening technique, or as a primary scouting method.

The use of this instrument does not require anaesthesia or special equipment. The cervix may be steadied with a tenaculum, after which the curette of a size fitting the canal snugly can be readily introduced. By bringing the cutting cups together quickly with a twisting motion, a rim of tissue is removed from the external os. When the instrument is loosely adapted to the canal, several bites may be necessary to complete a circumferential sample.

PHYSICIAN'S OFFICE SCALE



Every detail designed for efficient service. Material is the most substantial known to modern scale engineering. Dependability, permanent accuracy, lifetime performance.

The die cast beam with hardened knife edge pivots is mounted on glass hard bearings to eliminate wear at this vital point. The one piece top does away with assembled parts.

The two piece telescopic measuring rod is made of heavy steel tubing, finished in black enamel, easy to operate and read. White graduations are by ¼ inch from 30 to 78 inches. Platform is furnished with an inlaid rubber mat.

SPECIFICATIONS

COLOR—Standard finish oven baked white enamel. Hand grained and special finishes at extra charge.
SIZE—Platform 10½x14 inches. Space required 11x22 inches. Height overall 60 inches.
WEIGHT—Net weight 50 lbs. Shipping weight 78 lbs. Is packed in individual boxes.
CAPACITY — Model 202, 300 lbs., by ¼ lbs., with measuring rod.

SCHERING

Complete Protein . . .

THE KIND SUPPLIED BY MEAT . . .

and the Dietary Regimen in Arterial Hypertension

Contrary to the former traditional practice of restricting dietary protein, especially meat protein, in arterial hypertension, it is now recognized that adequate amounts of complete protein are needed by the hypertensive patient. The patient with hypertension, in common with normal individuals, should receive the usual allotment of protein, 60 to 70 grams per day.[1] This protein intake promotes a sense of well-being.

The previous belief that the high specific dynamic action of protein imposes excessive demands on the heart of the hypertensive patient has also been discredited clinically. Curtailment of the protein intake below that needed for metabolic requirements depletes body protein reserves, leads to excessive weakness, interferes with many immunologic reactions, and often is a factor in anemia or in its intensification.[2] Rather than an indication for restricting protein, albuminuria in hypertensive disease is an indication for determining whether the patient's protein intake should be increased to compensate for urinary losses.

In hypertension, the aim of the diet is to provide optimal amounts of protein, vitamins and minerals and to maintain the hypertensive patient at normal weight. By increasing the work of the already overburdened heart, obesity renders the patient more vulnerable to the hazards of hypertension. When weight reduction is indicated, lean meat may well be the mainstay of the dietary regimen. For patients requiring restriction of sodium, only unsalted meats should be used.

Furnishing large amounts of biologically complete protein, muscle meat can contribute valuably to the protein requirements of the hypertensive patient. But meat represents much more than just an excellent protein food. It also provides valuable amounts of iron and the B complex vitamins, including niacin, pyridoxine, riboflavin, thiamine, and the newly discovered vitamin B_{12}.

keep him active
. . longer
with plenty of citrus fruit

As at the other end of the age gamut, optimal nutrition can make a tremendous difference in the vigor and stamina of the oldster.[1,6,8-11] Many geriatricians stress the importance of vitamin C in the management of geriatric diets,[2,5,9] and recommend a fully adequate intake[5,9] of citrus fruits and juices (so often neglected by older people)—because of their high content of this essential vitamin and of other nutrients. Fortunately most everyone likes the taste of Florida citrus fruits and juices. They may be served in a variety of ways, and—under modern techniques of processing and storage, whether fresh, canned or frozen—they can *retain their ascorbic acid content,[3,7] and their pleasing flavor,[4] in very high degree and over long periods.*

FLORIDA CITRUS COMMISSION • LAKELAND, FLORIDA

Citrus fruits—among the richest known sources of Vitamin C—also contain vitamins A and B, readily assimilable natural fruit sugars, and other factors, such as iron, calcium, citrates and citric acid.

"In general, symptomatic improvement [of menopausal symptoms] was striking within 7 to 14 days after treatment…" with "Premarin."

Gray, L.: J. Clin. Endocrinol. 3:92 (Feb.) 1943.

Many clinicians have found that "Premarin" therapy usually brings about prompt relief of distressing menopausal symptoms. Furthermore, symptomatic improvement is followed by a gratifying sense of well-being in a majority of cases. This is the "plus" in "Premarin" therapy which tends to quickly restore the patient's normal mental outlook.

Four potencies of "Premarin" permit flexibility of dosage: 2.5 mg., 1.25 mg., 0.625 mg., and 0.3 mg. tablets; also in liquid form, 0.625 mg. in each 4 cc. (1 teaspoonful).

"Premarin" contains estrone sulfate plus the sulfates of equilin, equilenin, β-estradiol, and β-dihydroequilenin. Other α- and β-estrogenic "diols" are also present in varying amounts as water-soluble conjugates.

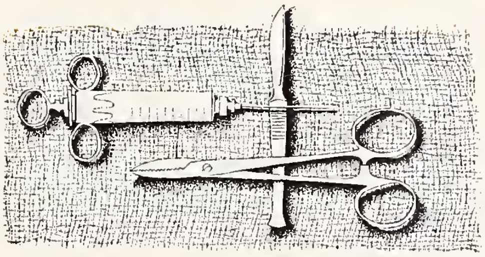
AUREOMYCIN

Hydrochloride Crystalline



The Surgeon is no longer hampered in his work by the fear of uncontrollable postoperative infections, thanks in large measure to the sulfonamides and the antibiotics. Aureomycin is indicated for preparation of the gut before enteric surgery. The high concentrations attained by aureomycin in the bile make it of particular value in operations on the infected biliary tract. Its efficacy against streptococci and staphylococci, which are becoming increasingly resistant to penicillin, renders its use advisable in surgical conditions where these organisms are actual or potential invaders.

Borden's
Bremil
Powdered Infant Food
calcium
phosph
potassi
iron
a new product

the Ca:P ratio is the key

A uniformly high calcium-phosphorus ratio . . . adjusted in Bremil to a guaranteed minimum of $1\frac{1}{2}$ parts calcium to 1 part phosphorus . . . this is the nutritional key to the prevention of hypertonicity, hyperirritability, and other tetanic symptoms in infants.

Gardner, Butler, et al., state: "Relative to human milk, cow's milk has a low Ca:P ratio . . ."[1] Nesbit writes: "Tetany of the newborn is now recognized as a definite entity . . . and often accompanied by an increased phosphorus and lowered blood calcium."[2] Dodd comments that "hypocalcemia tetany in the newborn may be of serious consequence."[3]

Bremil . . . newest product of Borden research . . . is a completely modified milk in which nutritionally essential elements of cow's milk have been adjusted in order to supply the nutritional requirements of infants deprived of human milk. Bremil is therefore a human milk replacement to which physicians can turn with confidence for uninterrupted good results.

an k	Bremil *(reconstituted)*	
%	0.078%	
ıg.	768 mg.	per qt.
%	.052%	
ng.	512 mg.	per qt.
%	.078%	
ng.	750 mg.	per qt.
3%	.00082%	
g.	8 mg.	per qt.

But an adjusted Ca:P ratio is not the only attribute that makes Bremil new and unique

Bremil has the fatty acid and amino acid patterns of human milk . . . the same carbohydrate (lactose) . . . vitamin adjustments to meet the recommended standards of infant nutrition[4] . . . a soft, flocculent curd of small particle size comparable to human milk . . . complete solubility.

Just as with human milk you can start the infant on Bremil the day it is born. Standard dilution is 1 level tablespoonful and 2 fl. oz. water, although Bremil can be either concentrated or diluted. Each level tablespoonful Bremil powder supplies 44 calories. Bremil is easy to prepare and can be mixed for a single feeding or a 24-hour period.

Complete information and a trial supply may be obtained upon request. Bremil is available in drugstores in 1 lb. cans.

Pure Crystalline Vitamin B_{12}

The Only Form Of This Important Vitamin Official In The U. S. P.

PREFERRED BECAUSE

potency, purity, and lack of toxicity of *crystalline* vitamin B_{12} are clearly established.

Potency: Potency of this U.S.P. product is accurately determined by precise weight.

Purity: Pure anti-anemia factor.

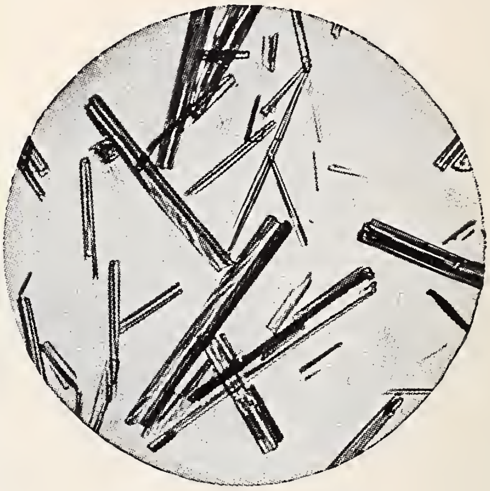
Efficacy: Produces, in microgram dosage, maximum hematologic and neurologic effects.

Tolerance: Extremely well tolerated; "no evidence of sensitivity" has been reported.

Toxicity Studies:

In recent pharmacologic investigations, extremely large doses of *crystalline* vitamin B_{12} (1,600 mg./Kg.) caused no toxic reactions in any of the animals treated. In contrast, 3 mg./Kg. of a "*concentrate*" caused fatal reactions in 100 per cent of the animals treated.

Merck—first to isolate and produce vitamin B_{12}—supplies Crystalline Vitamin B_{12} in saline solution under the trademark Cobione.* Your pharmacist stocks Cobione in 1 cc. ampuls containing 15 micrograms of crystalline vitamin B_{12}.



Crystalline Vitamin B_{12}

* *Cobione is the registered trade-mark of Merck & Co., Inc. for its brand of Crystalline Vitamin B_{12}.*

A Tribute to O. H. Wangensteen

THIS YEAR marks the twentieth anniversary of the first work in intestinal obstruction by Dr. O. H. Wangensteen, Department of Surgery, University of Minnesota Medical School. As the years have gone by, our knowledge of the value and limitations of siphonage drainage in ileus have been crystalized. There is no question that the simple expedient of decompressing the intestinal tract has made many operations upon the intestinal tract feasible or at least has lowered their mortality. Dr. Fred Coller of the Department of Surgery, University of Michigan Medical School, has stated that Doctor Wangensteen's work on decompressing the intestinal tract has been the greatest contribution to surgery in two decades.

Doctor Wangensteen's first interest in the subject of intestinal obstruction was not encouraged by some of the older members of the faculty who told him that "everything that could be known was known about intestinal obstruction." Also his first paper was rejected by the editor of the Proceedings of the Society for Experimental Biology and Medicine as being of "little scientific interest." As a result of this research, however, one never sees now-a-days an ileostomy or colostomy performed for a paralytic ileus, or hears that cases of strangulation obstruction should be treated conservatively. It is true that patients with complete mechanical obstruction of the large or small bowel still have to be operated upon to relieve the obstruction, but in the partial mechanical obstruction due to adhesions, how many lives have been saved and how many operations have been avoided by decompressing the intestinal tract with an indwelling intestinal tube?

Recognition and honor have come to Doctor Wangensteen in the past few years but he wears his mantle of greatness with modesty. More than his interest in research has been his interest in the training of future surgeons. Few teachers have had the respect and affection of their surgical fellows tendered Doctor Wangensteen. It was characteristic of him that the check presented to him at his testimonial dinner by the St. Paul Surgical Society in January, 1951, was given to the Travel Fund for his surgical fellows.

It is a happy occasion that this number of MINNESOTA MEDICINE is dedicated to Doctor Wangensteen. Few surgeons have received such international renown or set the pattern for surgical thoughts among their colleagues as he has. We in Minnesota are proud of the accomplishments of this native son.

FLUID AND ELECTROLYTE BALANCE IN INTESTINAL OBSTRUCTION

FREDERICK A. COLLER, M.D., and ROBERT E. L. BERRY, M.D.
Ann Arbor, Michigan

INTESTINAL obstruction has always been a dread event, one of great anguish and danger to the patient and one of great anxiety to the surgeon because of difficulties of diagnosis and the complexities of treatment. Both patient and physician owe much to a comprehensive study of this problem initiated by Dr. Owen Wangensteen more than twenty years ago. It has been carried on by him and his associates since that time. They have gone a long way in clarifying the many phases of the disease through their scientific and clinical studies and they have given direction to other investigators and important aid to the practicing physician.

The most widely acclaimed of Doctor Wangensteen's many therapeutic suggestions was a method of decompression, and the phrase "Wangensteen suction" has become fixed in surgical language. However, his studies on the nutritional and acute chemical abnormalities produced by intestinal obstruction, while perhaps not as spectacular, have been fully as important. In tribute to this phase of his research we present this brief review of the chemical imbalances associated with obstruction of the bowel.

The composition of the body fluids is now well established, but the factors that influence their rate of motion are as yet practically unknown.

The reconstitution and maintenance of the water, salt, protein and red blood cell needs of the patient with intestinal obstruction still present many challenging problems. By necessity, therefore, any discussion of fluid balance problems peculiar to this condition must be approached with awareness of our lack of knowledge of many aspects of body fluid dynamics.

Our concepts of treatment of dehydration produced by intestinal obstruction have been slowly evolved from the great amount of research, both experimental and clinical, done by many investigators. That the abnormal loss of body fluids could produce serious and even lethal sequellae had been observed by O'Shaughnessy (1831) over one hundred and twenty years ago.[11] His researches in which he observed hemoconcentration, diminution of blood sodium, chloride and bicarbonate as well as increase in blood urea in patients with cholera were remarkable original investigation for that time. Based upon the response of his patients he advised administration of "the normal salts" of the blood either intravenously or by proctoclysis. Despite confirmation of his work by other workers, full acceptance of his observations was not achieved until much later because of inertia and ignorance.

Prior to 1912 the accepted theories as to the cause of death in intestinal obstruction were: (1) the reflex nervous action on the cardiovascular center, (2) the bacterial invasion outward from the intestinal lumen either into the peritoneum or into the blood itself, and (3) the absorption of toxins from the intestine produced by bacteria, food decomposition and secretory activity of the glands of the intestine. The importance of dehydration as a lethal factor in obstruction was first suggested by the experiments of Hartwell and Hoguet (1912) who observed that the lives of dogs with high intestinal obstruction could be significantly prolonged by the subcutaneous injection of normal saline solution.[7] These investigators felt, however, that the loss of water due to vomiting was the important element in the development of symptoms and that intoxication resulted from tissue disintegration resulting from such water loss.

Observations upon the profound disturbances in the electrolyte pattern of the blood in experimental pyloric obstruction were first made by MacCallum and his associates (1920).[9] These investigators found that such obstructions produced marked decrease in the blood chlorides and an accompanying increase in the alkali reserve. There was also an associated increased electrical excitability of the nerves that could produce violent convulsions. The beneficial effects of the administration of large amounts of sodium chloride were also observed but the mechanism by which such benefits were obtained remained obscure.

From the Department of Surgery, University of Michigan Medical School, Ann Arbor, Michigan.

Hayden and Orr (1924)[6] observed the same changes in blood electrolytes produced by obstructions of the small bowel as had been pointed out by MacCallum. In their interpretation, these workers assumed that the fall of blood chlorides was not due to abnormal loss through vomiting but to fixation in the tissues with a toxin from the obstructed bowel. This utilization of the chloride ion was assumed to be a protective mechanism on the part of the body and that the administration of large amounts of sodium chloride reduced this toxemia. The views of Hayden and Orr were strongly attacked by Foster and Hausler (1929) who concluded from their experiments that death in intestinal obstruction was due to dehydration and starvation and there was no evidence of toxemia.[3]

A sound basis to explain many of the laboratory and clinical phenomena observed in obstruction was first offered by Gamble and Ross (1925).[4] Their observations led them to believe that failure of physiological processes and death following experimental obstruction of the pylorus could reasonably be due to continued reduction of the volume of body fluids by continued loss of chloride and more importantly sodium and that the beneficial effects of sodium chloride administration were due to repair of the chemical structure of certain body fluids permitting recovery of a normal volume of body water. They also pointed out that the administration of water with or without glucose or the chloride ion alone (NH_4Cl) was not effective in preventing dehydration. After twenty-five years these observations remain as the basis for the restoration and maintenance of the extracellular fluid volume.

Gatch and his associates (1927) observed changes in blood electrolyte similar to those observed by Gamble, in small bowel obstructions.[5] They also attributed death in intestinal obstruction to dehydration, reduction of blood chlorides by vomiting and starvation. Their experiments demonstrated, however, that sodium chloride treatment was not effective in strangulated obstructions.

Following the researches of these pioneer investigators the great bulk of experimental and clinical data has provided a progressive betterment of our knowledge of the treatment of dehydration produced by intestinal obstruction and futhermore has suggested that almost all, if not all, of the deleterious systemic effects associated with intestinal obstruction are due to dehydration and bowel distention and that toxemia in simple obstruction probably does not exist. Strangulated obstructions and particularly those in which bowel perforation has occurred with general peritoneal contamination may produce toxemia, but the toxemia is due to peritonitis and not to the obstruction itself.[1]

The degree of depletion of body fluid and electrolyte, both extracellular and intracellular, depends upon the site of the obstruction, duration of the period of loss and whether perforation of the bowel with resultant peritonitis has taken place. As a general rule the higher the obstruction and more prolonged the period of distention and vomiting, the greater will be the loss. The clinical picture may vary, therefore, from the patient showing no signs of dehydration to the individual who is in severe shock or moribund from the loss of body fluids.

All attempts at replacement of the constituents of the extracellular and intracellular fluid compartments lost in intestinal obstruction must be geared to the history and the clinical picture presented by the patient. Too much emphasis cannot be placed upon the importance of using the clinical status of the patient as the primary guide in replacement therapy. Laboratory studies of the blood and urine may provide important confirming evidence as to the patient's status, but reliance upon them as an absolute guide is inaccurate and may be hazardous. Maximum accuracy is obtained by the careful correlation of all clinical and laboratory guides, with the clinical appearance of the patient being paramount in the estimation of his condition.

Electrolyte Replacement and Maintenance

Effective rules or formulae for the replacement of electrolyte cannot be offered because of the necessity of adjusting such administration to the clinical condition of the patient. The emphasis has been and still is upon the replacement of the chief extracellular ions sodium and chloride. The large losses of body fluid associated with severe and prolonged intestinal obstruction also produce depletion of the important intracellular ion potassium.

Dehydration observed in intestinal obstruction is of the mixed type containing components of both water and electrolyte dehydration. When

TABLE I. SYMPTOMS AND PHYSICAL SIGNS PRODUCED BY LOSS OF TWO TO SIX PER CENT OF BODY WEIGHT AS EXTRACELLULAR SALT WATER

Two to 4 Per Cent Loss of Body Weight as Extracellular Salt Water	Four to 6 per cent loss of Body weight as Extracellular Salt Water
Anorexia Apathy Weakness Reduced affective responses Nausea Vertigo Soft pulse Diminished peripheral venous filling Variable changes in blood pressure Loss of tissue turgor	Aggravation of all signs and symptoms found in 2-4 per cent body weight loss Retching Orthostatic hypotension Tachycardia Wrinkled tongue Marked loss of tissue turgor "Putty" like muscles Soft eyeballs Shock

manifest symptoms and signs of severe dehydration are present, between 4 and 6 per cent of body weight has been lost as water and electrolyte (Table I). This offers a clinically effective index as to the quantitative amount of repair fluid that may be necessary for repletion. In the absence of shock or hypotension, replacement should be started with a 0.6 per cent sodium chloride solution rather than 0.9 per cent, as it is felt that this solution is handled more physiologically by the body and provides immediate water for insensible loss through the skin and lungs as well as water to aid in the formation of urine. If hypotension and shock are present due to sodium chloride depletion, then the administration of a 1.5 to 2 per cent sodium chloride solution combined with blood transfusions is indicated until the blood pressure is brought to satisfactory levels. Repletion can then be continued with the 0.6 per cent solution.[10]

When adequate repletion has been obtained, maintenance of electrolyte balance is usually less difficult but just as important as repletion. Volume for volume replacement of the extrarenal loss of body fluids, excepting insensible loss, with lactated-Ringer's solution is a satisfactory working clinical guide.[1]

General improvement in the patient's clinical condition, diminution of signs of electrolyte dehydration, reappearance of adequate urine output containing satisfactory amounts of chloride, and the re-establishment of normal levels of blood electrolyte and pH—all present positive evidence as to the effectiveness of treatment.

Potassium, the chief intracellular electrolyte, is lost in significant amounts when large volumes of gastrointestinal secretions are aspirated or lost by vomiting or diarrhea. Furthermore, it has been observed that the administration of sodium chloride solutions used for repair can further increase potassium loss.[8] The importance of replacing this physiological important potassium has not been thoroughly appreciated until recent years, and considerable attention is now being given it in surgical literature. Experimentally, it has been demonstrated that the lives of dogs with pyloric obstruction can be significantly prolonged beyond that reasonably anticipated from the use of sodium chloride when potassium salts are added to repair solutions.[2] Potassium salts should be added to the repair solutions, after adequate urinary output has been obtained, to aid in the restoration of intracellular water and electrolyte. The oliguria associated with uncompensated large losses of body fluids may make the immediate administration of potassium salts hazardous because of the danger of heart block when serum potassium levels approach 10 to 12 milli-equivalents. Two to 6 grams of potassium, either as the chloride or a combination of the monobasic and dibasic phosphates, may be added to the repair solutions daily.

Water Repletion and Replacement

The status of water hydration is closely allied to the quantitative available electrolyte, as total body water is dependent upon total body salt. Additional water is necessary, however, to provide for the insensible loss through the skin and for the formation of sufficient urine. Water for this purpose should be given as 5 per cent glucose in distilled water as the administration of sodium salt solutions necessitates the "distillation" of water by the renal excretion of the excessive salt, a process that is often inefficient in the sick patient. Dependent upon the environmental and body temperatures, insensible loss ranges from 1000 to 2000 c.c. per day. During hot weather it may be much greater. Another 1000 c.c. of fluid or more is necessary to insure adequate formation of urine.[1]

It has been pointed out by Wangensteen[12] that careful weighing of patients preoperatively and postoperatively affords valuable information as regards too rapid depletion or accretion of total body water. Scales for this purpose are accurate to within 100 grams. In obstructed patients, however, whose hydration at the time of hospitalization may be far from normal, this method has diminishing value. When dealing with normal kidneys, a most accurate index of water needs may be obtained by the urinary specific gravity. If the specific gravity is less than 1.020, it is reasonable to assume that the kidneys are getting adequate water to perform efficiently. If the specific gravity is greater than 1.020, the kidney may not be obtaining enough water to work with, and further administration of fluids is indicated.

It is obvious that during a period of repletion and subsequent maintenance of a seriously dehydrated patient that several liters of electrolyte and glucose solutions, together with blood and/or plasma, must be administered. There are hazards of overhydration particularly in older patients and those with poor cardiac reserve. Symptoms of overhydration must be carefully watched for and the administration of fluids slowed or discontinued as may be necessary (Table II).

TABLE II. SYMPTOMS AND PHYSICAL SIGNS PRODUCED BY ABSOLUTE WATER AND/OR SALINE EXCESSES

Absolute Water Excess	Saline Excess
1. Due to extrarenal excretion of excess water:	Disorientation Anorexia
Salivation	Nausea
Lacrimation	Vomiting
Non-projectile vomiting	Hoarseness
Diarrhea	Heavy eye lids
Intracutaneous edema	Diminished urine flow in relation to intake
2. Due to increased intracranial pressure:	Subcutaneous edema Pulmonary congestion
Headache	Edema of parenchymal organs
Disorientation	Ascites
Muscle twitching	Hydrothorax
Bradycardia	
Vomiting	
Nausea	
Elevated blood pressure	
Anorexia	
Increased spinal fluid pressure	
Convulsions	
Coma	

Acid-Base Balance

Because of the disparity of the relative concentration of sodium and chloride in certain gastrointestinal secretions, as compared to blood plasma, their loss may produce an increase or decrease of blood pH depending upon which ion has the greatest loss. Most acid-base disequilibrium states in intestinal obstruction are of the metabolic type. It is therefore reasonable to assume that a fairly accurate estimate of the severity of "acidosis" or "alkalosis" may be obtained from determination of the CO_2 content of the blood. When present, severe compositional changes of this type should receive early and vigorous treatment. Alkalosis, as manifested by increased blood pH and carbon dioxide content, will respond, in the majority of cases, to Ringer's solution without added lactate, normal equilibrium being established as repletion is completed. Extremely severe alkalosis may require the administration of 0.9 per cent ammonium chloride solution, but these cases tend to be unusual. It should be remembered that potassium deficits may be associated with high refractory carbon dioxide content of the blood and that correction of the alkalosis is obtained only when potassium salts are administered.

Acidosis, manifested by low carbon dioxide content and lowered blood pH, may be treated by a one-sixth molar solution of sodium lactate provided that shock or liver damage is not present. The administration of sodium bicarbonate as a 1.3 per cent solution will be necessary to combat acidosis in patients in shock or who have severe liver damage, as sodium lactate is inefficiently utilized when these conditions are present.

Plasma and Red Blood Cell Administration

With strangulation, thrombosis or embolism of the blood vessels there will occur a loss of blood that is always serious and may decide the issue. In other forms of obstruction a better understanding of the acute serum protein deficits and red blood cell losses in intestinal obstruction has emphasized the necessity of their replacement during both the repletion and maintenance periods. In the presence of severe sodium salt depletion the total circulating protein diminishes at approximately the same rate as the volumes of plasma and the extravascular extracellular fluid do. Large losses of extracellular salt water are associated, therefore, with losses of plasma protein. The rapid reconstitution of extracellular fluid volume without replacement of this plasma protein loss is to invite loss of vital intravascular fluid into the interstitial spaces, with resultant edema, because of increased capillary hydrostatic pressure and decreased colloid osmotic pressure. At least 500 c.c. of blood, therefore, should be given with each 3000 c.c. of repair fluid when repleting large losses of body fluids.

Acute protein loss may be further augmented by loss into the edematous bowel wall and transudation into the intestinal lumen and peritoneal cavity. Repeated transfusions of blood and/or plasma may be necessary to replete such acute protein deficits. If peritonitis has followed bowel perforation, there are even greater losses of blood proteins, and generous transfusions of both plasma and blood will be necessary to maintain the plasma volume and the circulating red blood cell mass.

Summary

1. The important lethal factor in simple intestinal obstructions is dehydration and bowel distention. Toxemia probably does not exist.

2. Knowledge regarding fluid and electrolyte balance in intestinal obstruction has been importantly advanced, but many aspects remain poorly understood because of inadequate understanding of the dynamics of fluids between the various body fluid compartments.

3. The repletion and maintenance of the various extracellular and intracellular constituents lost in intestinal obstruction have been discussed.

A PROPOSED STUDY OF PREMATURITY AND CONGENITAL MALFORMATIONS

Premature birth has appeared as one of the ten leading causes of death in Minnesota for a number of years. During 1949 congenital malformations entered the picture as the tenth leading cause of death in the State. The appearance of congenital malformations in the leading causes of death apparently resulted from the rapid decline in the number of deaths attributed to tuberculosis, formerly in tenth place and the increase in the number of live births in recent years. There has been no appreciable increase in the congenital malformation death rate during the past two decades. The rate has varied between 4.6 and 6.5 per 1,000 live births since 1930. Slightly more than 80 per cent of all deaths due to congenital malformations occur within the first year of life. Over 93 per cent of the deaths attributed to premature birth occur within the first week of life.

Because of the importance of prematurity and congenital malformations in the infant death picture, the Division of Vital Statistics, under direction of the Division of Maternal and Child Health, is conducting studies relating to these two causes of death. The new birth certificate form, adopted in Minnesota at the beginning of 1950, affords basic statistical information for this study. Weight of the child, weeks of gestation and the presence of congenital malformations are the basic items being studied. Information regarding the existence of congenital malformations for all births has been made available for the first time during 1950. All information contained in the medical portion of the birth certificate is confidential in nature. It is used for statistical purposes only. When certified copies of the birth record are issued, the medical portion of the record is not filmed. It is vitally important that physicians and others completing the birth records understand this fact clearly.

Information being tabulated at the present time according to weight include:

1. Color of the parents
2. Single or multiple births
3. Attendant's specifications regarding full terms or prematurity
4. Birth order of the child
5. Presence or absence of congenital malformations

The birth data are tabulated in weight intervals of one pound except for the five-pound interval which is divided between five pounds, eight ounces and under—five pounds, nine ounces and over. Infants weighing ten pounds or more are tabulated as a single interval. Special studies will also be made regarding the survival rate of infants reported to have congenital malformations.

The aim of the present study is to obtain as accurate a picture as possible of the premature and congenital malformations problem existing in Minnesota. The study will be extended for a number of years. Its value is dependent largely upon the care and accuracy with which the birth records are completed by the attendant. Special appeals are being made to physicians and hospital groups to give careful attention to the statistical section of the birth record.

PRIMARY INTESTINAL ANASTOMOSIS

I. S. RAVDIN, M.D., and WILLIAM DeMUTH, JR., M.D.
Philadelphia, Pennsylvania

FEW surgeons have contributed as much to our knowledge of the pathologic physiology of gastrointestinal disease as has Owen H. Wangensteen. To him, and to those who have worked with him, American medicine is indebted for innumerable contributions which have extended our knowledge of a wide variety of gastrointestinal disorders. Among the most important of these contributions was the work from his clinic on the importance of relieving gastric and intestinal distention by intubation without recourse to operation. It was not Doctor Wangensteen's fault that many surgeons failed to heed his admonitions regarding the necessity of early operation when signs of gangrene were present, or when intubation failed to provide significant relief from serious symptoms. These faults can be ascribed to the frailities of man, and our profession is not free of them. Intestinal intubation, as introduced by him and extended by T. Grier Miller and William Osler Abbott, has reduced the morbidity and mortality of many diseases and procedures which the surgeon daily encounters in his work.

Our initial experience with long-tube intubation in the management of small and large bowel lesions was reported by Abbott and the senior author[5] just a decade ago. At that time twenty-six primary anastomoses of small and large bowel had been done without the use of surgical proximal decompression procedures. A death from coronary occlusion represented the only mortality in this group.

Our enthusiasm for this method has not lessened since that time. The results during the past decade lead us to believe that resection and primary anastomosis has proven to be a safe operation in many patients requiring excision of segments of the small or large bowel. Prior to 1946, however, primary anastomoses following resections, especially for large bowel lesions distal to the hepatic flexure, were done relatively infrequently in this clinic.

During the past five years there has been a steady and marked increase in the number of primary anastomoses following bowel resection, regardless of location of the lesion. Ileocolostomy, without exteriorization procedures, in by-passing unoperable large bowel cancers, has likewise become much more common. Strangulations secondary to volvulus, mesenteric thrombosis and obstructed hernia, certain instances of intussusception, obstruction due to adhesions, isolated inflammatory processes, malignancies, and traumatic injury, when found in the small bowel, are all lesions which, we feel, are in general best treated by resection and primary anastomosis. The marked electrolyte disturbances secondary to large losses of intestinal fluids are thereby obviated, and the time required for secondary anastomosis is saved.

This approach has resulted in a lower morbidity and a need for fewer hospital days for patient care. In most instances when simple obstructions, partial or complete, are present which require a resection, we now find it possible to do a primary anastomosis following resection of the involved bowel. Constant suction internal drainage makes this not only feasible but safe. An understanding of the pathologic physiology of bowel distention leads to a rational program of treatment. Wangensteen,[8] in his excellent monograph on "Intestinal Obstructions," discusses the ramifications of the effects of distention and states ". . . the mechanistic conception of the ill consequences of obstruction provides better interpretation and a more acceptable explanation of the phenomena and end effects which attend bowel obstruction than does the toxic absorption theory." Whether one agrees with this statement or not, distention is all too frequently the motivating factor initiating a train of events which results in death. The control of distention is the clue to successful preparation of the bowel for primary anastomosis. The integrity of the anastomosis depends upon the condition of the wall of the obstructed bowel which has or has not been well prepared preoperatively. The dilated, grossly dirty bowel hav-

---

ing a poor blood supply provides poor material for a successful anastomosis.

If primary anastomosis is to be safe without proximal external drainage, marked degrees of distention must be avoided. By using the long intestinal tube to prepare the bowel preoperatively, and to protect the suture line postoperatively, we believe that staged operations are no longer necessary in many cases which heretofore have been so treated. Cecostomy, appendicostomy, colostomy, and enterostomy are being used less and less by us, either before or at the time of operation. Even in patients with a high-grade partial large bowel obstruction we are doing more primary resections and anastomoses than proximal colostomies, This trend is reflected in the results of the survey made by Rankin[4] in which only 30 per cent of a considerable number of surgeons questioned employed appendicostomy, cecostomy, or colostomy regularly either before or at the time of resection of the distal colon or rectum.

Preoperative Preparation of the Obstructed Patient

In suspected strangulated obstructions, shock, if present, is immediately combated by the use of blood and plasma while arrangements for early operation are being completed. The administration of sedatives must be attended by considerable caution. The marked colicky pain often associated with high-grade obstruction may lead one to use opiates excessively. Pain stops when decompression is adequate, and its presence casts suspicion on the fuctioning of the tube. If shock is present, delayed absorption of the drug may give late marked depression of the central nervous system and of respiration. The exquisite tenderness so frequently present in strangulation obstruction may be so lessened as to result in an unfavorable delay in operation in the belief that a simple obstruction is present. Once the general condition of the patient is rendered sufficiently good to stand a surgical procedure, the operation should not be delayed. If such response is not prompt following the infusion of blood or plasma, one should not further delay operation, since not infrequently release of the obstruction is the only thing which will result in improving the patient's condition.

A scout film of the abdomen is made as soon after admission as possible to determine the approximate site of obstruction. Localization of the lesion will in the majority of instances be made by correlation of roentgenographic findings, history and physical examination.

Intubation.—The Miller-Abbott tube is then passed into the stomach and the stomach emptied by aspiration. By using 3.0 c.c. of mercury in the balloon of the tube and by placing the patient in the right lateral decubitus position, we have been successful in getting the tube beyond the pylorus in a high proportion of obstructed patients. Fluoroscopy is a great help. Those with high-grade small bowel obstruction are not infrequently difficult to intubate. After the tube enters the duodenum, constant suction is applied, and the balloon is inflated to effect passage of the tube toward the point of obstruction. When the obstruction is reached, the balloon is deflated.

The relief of distention preoperatively serves a twofold purpose. The general condition of the patient is frequently dramatically improved, and the local improvement in the bowel wall makes the possibility of a definitive procedure much more likely at the time of operation. Van Zwalenburg's[7] conclusions concerning the vascularity of distended bowel are still valid, and if primary anastomoses shall heal without leaking, the blood supply to the involved segments of bowel must not be compromised. The danger of leakage at the relatively weak suture line with increased intraluminal pressure is a real one.

If, as occasionally occurs, the long tube does not function, we do not hesitate to replace it by a Levine tube to facilitate decompression (Wangensteen and Paine.[9]) Our preference for long-tube intubation was set forth[5] ten years ago. This method in our hands has been most satisfactory.

A competent ileocecal valve effects a closed loop obstruction if the obstruction is in the large bowel. The tube must enter the cecum if distention under these circumstances is to be relieved. The ileocecal valve often will not admit the tube, and operation is depended upon for relief of distention.

Cleansing of the Bowel.—D. F. Jones[3] stressed the fact that an empty clean bowel was one of the best safeguards against postoperative peritoneal infection. If the local condition of the bowel permits one to delay operation for several days, we feel that mechanical cleansing and the reduction in the number of bacteria residing in the bowel can and should be accomplished. The program we presently employ requires five days immediately before operation.

In cases of anticipated large bowel resection the patient is given an enema of tap water daily. Mild purgations in the form of milk of magnesia or magnesium sulfate solution are also used daily. A low residue diet is given through the day prior to operation. Sulfasuxidine, 0.25 gram per kilogram of body weight, is given by mouth daily in four divided doses. Two days prior to operation 0.5 gram of streptomycin is administered by mouth twice daily. The Miller-Abbott tube is passed forty-eight hours before operation, and the sulfasuxidine and streptomycin are administered by mouth with the Miller-Abbott tube in place. Studies[6] of the bacterial flora of the large bowel carried out in this hospital before and after the administration of sulfasuxidine and streptomycin have been convincing, and we routinely employ these agents. We do not feel that the use of these drugs should supersede in importance the gross cleansing of the bowel.

Blood transfusions are given preoperatively as blood volume, hemoglobin, and serum protein determinations indicate.

Technique

Only general principles of operation will be discussed.

When dealing with malignancies of the large bowel, we believe that the wide mesenteric resection with wide resection of the involved bowel is mandatory. Gilchrist and David's[2] monumental study leaves little doubt concerning this.

Secondly, we prefer the open technique of intestinal anastomosis. We feel that the accuracy of apposition of the bowel ends is better with open anastomoses than with closed techniques and less bowel is turned in. A clean bowel affords little danger of peritonitis due to contamination at the time of anastomosis. The gross contamination incident to a leaking suture line is a far greater hazard.

In general, end-to-side anastomosis is used in the ileocolostomy following resection of the right colon. End-to-end anastomosis is routinely used following segmental resections in both the small and large bowel.

A double suture line technique is followed. Very fine chromic catgut is used for mucosal approximation, and an interrupted silk suture line is used in the seromuscular layer. Crushed tissue is excised, and under no circumstances is such tissue incorporated in the suture line.

Gentle handling of the bowel is mandatory. Great care must be exercised in preserving the blood supply of the bowel adjacent to the suture line.

Postoperative Care

Parenteral penicillin and streptomycin are used routinely prophylactically for at least four days. Continuous Wangensteen suction is applied to the Miller-Abbott tube until gas is passed by rectum (usually the third or fourth postoperative day). The tube is then clamped for a period of twelve hours during which time 30 c.c. of water per hour is given by mouth. If no distention results, the tube is then gradually withdrawn and clear liquids are permitted ad lib. If intestinal motility seems to be adequate, a soft diet is begun twenty-four hours following removal of the tube.

In general, blood replacement to compensate for blood lost at the time of operation has been replaced by transfusion of whole blood while the patient is on the operating table or within a few hours following operation. In the past two or three years we have tended to keep the daily volume of infused fluids to 2500 c.c or less. Sodium chloride intake is rigidly restricted. This is especially important in the aged. As Coller and his associates[1] have shown, it is easy to err in giving excessive fluid and salt in the early postoperative period with resulting serious complications. Ascorbic acid, vitamin K and the B-complex vitamins are given postoperatively during the period of parenteral feeding.

The majority of our patients are made ambulatory on the first postoperative day.

Results

In the five-year period between January 1, 1946, and December 31, 1950, exactly 394 intestinal anastomoses without external decompression were done. In all cases intestinal decompression was managed by means of the Miller-Abbott or indwelling duodenal tube with the application of Wangensteen suction drainage. No cases in which exteriorizations or obstructive type resections were done are included in this report. Thirty-eight of these patients were subjected to ileocolostomy as a side-tracking procedure in inoperable

*Patients in whom failure of anastomosis was found at autopsy.

lesions of the large bowel. In the remaining 356, resections were done with primary anastomosis.

Table I shows a distinct trend toward anastomosis without concomitant or preliminary surgical decompression or exteriorization procedures. In both 1949 and 1950 the total number of such operations was approximately twice those done in 1946. It will be noted that left-sided colon lesions are now being resected and the bowel ends anastomosed at the same operation with increasing frequency. In dealing with right colon lesions one-stage right colectomy with ileotransverse colostomy is the only procedure used in operable lesions. This has been the policy in this clinic since 1938.[6] Whipple[10] reported favorable results with similar management in such cases in 1940.

The number of small bowel resections has remained relatively constant year after year.

Mortality.—Sixteen patients (Table II) in this group of 394 died during the thirty days following operation (3.8 per cent). Postmortem examinations were obtained in nine of these cases. A leak at the line of anastomosis was established in but one case. This patient had had an anterior resection for a lesion low in the sigmoid colon.

Coronary occlusion, pulmonary embolism, uremia, bronchopneumonia, and cerebral thrombosis were named as the other causes of death.

The highest mortality occurred in those patients having small bowel resection following mesenteric thrombosis. Progression of the underlying disease has usually been responsible for death.

Two deaths in the ileocolostomy group occurred in patients in which widespread peritonitis occurred due to perforation of the primary lesion. In another, extensive metastasis was responsible for death.

Discussion

There can be little doubt that the primary establishment of intestinal continuity, at the time of bowel resection is the ideal operation. This is so, however, only if function is rapidly regained and if morbidity and mortality are as low as with multi-stage operations. Saving the patient a second anesthetization and operation reduces the inherent risk. Our single death from peritonitis following the single stage resection demonstrates that in patients properly prepared infection from leakage is no longer a common cause of death.

The outlined preoperative preparation, we believe, is advantageous even when primary resection is not possible or even contemplated. The clean bowel possessing a good circulation is better handled in any operation deemed necessary at the time of laparotomy.

A few statements concerning the limitations of this method should be made. If there is ever any doubt about the presence of strangulation, prompt laparotomy is indicated. Acute colon obstructions with major proximal distention should not be so treated. Surgical decompression is necessary. In many such instances resection with anastomosis is possible, but in any case the removal of the segment of devitalized bowel should be the first consideration. Intubation will aid in the postoperative period. It will make the patient more comfortable and it will add to the safety of the operation.

Resection with primary anastomosis in the treatment of malignancies should never be done to permit of a limited excision of bowel and mesentery with the goal solely of re-establishing intestinal continuity. Our philosophy is in accord with that of Gilchrist and David, who so aptly stated[2] that the point of discussion in treatment of large bowel malignancies should be, "Can you remove all the cancer?" and not, "Can you sew two ends of bowel together." However, the most extensive excisions above the lower sigmoid lend themselves to this procedure. Intraperitoneal lesions below the sacral promontory are treated by one stage abdomino-perineal resection.

Ravdin and Abbott,[5] and Whipple[10] and others have stressed the importance of experience in the successful management of the Miller-Abbott tube. The possible dangers must be recognized. The use of fluoroscopy in passing the tube beyond the pylorus, the proper adjustment of the balloon, and the interpretation of the results of suction drainage cannot safely be the responsibility of inexperienced personnel. Fumbling in the early stages of acute obstruction can make the difference between success and failure in the passage of the tube into the distal small intestine.

It is obvious that the concept of primary anastomosis embraces more than the accurate approximation of two bowel ends. Intestinal suction-drainage, the use of chemotherapeutic agents, the infusion of blood and fluids, the correction of protein and vitamin deficiencies and the correction of electrolyte imbalances are all important adjuvants to complete therapy, and they have made possible a more direct and safe attack on lesions requiring intestinal resection and anastomosis.

Summary

Results obtained in the five-year period between January 1, 1946, and December 31, 1950, in 394 patients in whom primary intestinal anastomoses accompanied by intubation and suction drainage as the sole source of decompression are reported. Intestinal resections were done in all but thirty-eight of the reported cases.

The over-all mortality was 3.8 per cent.

Primary anastomosis following resection of bowel segments, or used alone in bypassing inoperable lesions, is a safe, rational procedure which saves the patient both time and prolonged incapacity. In the treatment of cancer it in no way modifies the radical approach to the eradication of the disease.

WORLD HEALTH ORGANIZATION

More than 250 fellowships will be awarded this year by the World Health Organization to medical and allied personnel throughout the world for advanced study.

Technical and teaching personnel from WHO member states with at least two years of experience in the field in which the fellowship is sought are eligible for the WHO awards. Applications are made to WHO through the applicant's government.

The World Health Organization has already awarded approximately 800 fellowships in a variety of fields. These include, for example, public health administration, communicable diseases, nursing, maternal and child health, internal medicine, and surgery.

The Pan American Sanitary Bureau, Regional Office of the World Health Organization, awards from its own budget, additional fellowships for public health trainees in the Americas. During the past year the Bureau granted some thirty-five fellowships for studies extending from several weeks to a full academic year. This is in addition to the financing by the Bureau during 1950 of shorter-term training courses for more than eighty men and women in serological laboratories and a public health nursing workshop.

PROGNOSTIC FACTORS IN COLONIC MALIGNANCY

CLAUDE F. DIXON, M.D.
Rochester, Minnesota

I WAS delightfully overwhelmed when your secretary asked me to take part in this meeting honoring Doctor Wangensteen. I should like to think that the invitation to participate in the program this evening was extended because you, in some manner, consider my ability as a surgeon on a parity with that of the honored guest. But, since this is not true, I must deflate my ego and realize that I am here because Owen Wangensteen has been my esteemed close friend for twenty-five years. What greater honor could I ask?

Upon his return from the Western Surgical Association meeting in Denver in 1931, the late Dr. E. Starr Judd informed me that the outstanding presentation at that meeting was a paper by Doctor Wangensteen in which he reported three cases of mechanical obstruction of the bowel successfully decompressed by means of nasal catheter suction-siphonage. We are all familiar with the great advances that have stemmed from this epoch-making work and the devices Wangensteen has developed for the management of obstruction of the bowel. We are aware too of the value of the Wangensteen tube in the preoperative and postoperative patient. It must be a constant satisfaction to Dr. Wangensteen to realize that the procedure he advocated and carried out twenty years ago has world-wide acclaim to this day.

On this occasion I have chosen to discuss prognostic factors in colonic malignancy.

It is timely, I feel, to mention here that Wangensteen's contribution on the management of intestinal obstruction might have passed into oblivion for the reason that almost all of our national medical journals turned down his early manuscripts on the subject. Perhaps they were too lucid and therefore were returned as "not of general interest." But Owen was firmly convinced that he had found something of value, and today even editors of medical journals recognize his outstanding work on intestinal obstruction as well as in many other fields.

The past two decades have witnessed great advances in the prognosis of carcinoma of the colon from the standpoint of mortality, morbidity and five-year survival. Although some advance has been made for the cause of earlier diagnosis of malignant lesions of the colon through cancer detection centers, repeated pleas at medical meetings and writings in both the lay and professional press, the percentage of early cancers diagnosed still is too low. The simple diagnostic methods should be familiar to all. They are not new. Digital rectal examination of growths in the rectum was advocated six hundred years ago by Master John of Arderne with these words: "And thus shall ye recognize it. Ye shall put your finger in the rectum." Professor Strauss of Berlin invented and developed an electric sigmoidoscope a half century ago. Insufflating air into the colon after evacuation of the barium has been known and practiced for a quarter of a century. Neglect to perform these maneuvers by the physician is much too frequent, and every effort should be made to encourage physicians to follow the advice of John of Arderne.

The medical profession cannot assume all of the responsibility for this failure of early diagnosis. The patient must initiate the process leading to the detection and treatment of cancer. King and Leach, of Memorial Hospital, New York, undertook to determine some of the "whys" of delay in seeking medical care. They found the greatest tendency toward delay among the following groups of patients: (1) patients whose established reaction to previous illness had been to seek medical advice only when having an acute discomfort or pain; (2) those who interpreted their illness as being a common illness or a recurrence of some previous illness (bleeding of hemorrhoids, and so forth); (3) patients whose chief attitudes toward medical care were fear of the examination, fear of knowledge, or fear of surgical intervention or of disfigurement; (4) patients who believed that their financial resources were inadequate to permit payment for medical care.

A long, painstaking educational process will be required to remedy these conditions. Experience

---

Read at the meeting of the Minnesota Academy of Medicine, Saint Paul, Minnesota, December 13, 1950. The assistance of Dr. John D. Rosin in the preparation of this paper is acknowledged.

From the Division of Surgery, Mayo Clinic, Rochester, Minnesota.

has shown that prompt diagnosis and therapy will reduce morbidity and mortality. The debilitating effect of delay on the part of the patient can be overcome by an educational program which will make the prospective patient not want to delay.

We shall all agree that time remains the greatest single factor that influences the final result in the individual case of malignancy: the time between initiation and discovery of the malignant process, and the time between discovery and adequate removal of the lesion. At some time, regardless of the patient's age and heredity and the location, grade or type of malignant lesion, cancer of the colon for the most part is curable. Visceral cancer is a silent disease. The period necessary for the transformation of normal epithelial cells from a normal mucous membrane into malignant cells is not known. The length of time before invasive features cause the appearance of symptoms is variable, perhaps averaging about a year. If digital and endoscopic examinations are performed as a routine on every patient, a larger number of persons will come to operation when the lesions are silent and curable by surgical means. Seventy-five per cent of lesions of the colon and rectum are within reach of the finger and the sigmoidoscope.

There are certain prognostic factors peculiar to the patient. It is well known that patients in the younger age groups have a poorer prognosis as a whole than do members of the older age groups, regardless of the grade of the lesion. In the young the grade of the malignant lesion tends to be higher and metastases occur earlier. Many physicians are not on the alert for colonic malignant lesions in patients under the age of forty years, although 11.5 per cent of the malignant lesions of the large intestine seen at the Mayo Clinic between 1907 and 1938[3] occurred under the age of forty years.

Associated colonic disease influences prognosis. In 100 per cent of cases of multiple polyposis of familial origin, if neglected, multiple carcinomas will develop, as a rule while the patient is still young, and with a most unfavorable prognosis. Multiple asynchronous primary carcinomas of the colon occur in 3 to 5 per cent of cases, indicating that a thorough exploration must be made at each laparotomy. With another disease of younger persons, chronic ulcerative colitis, carcinoma develops more often than for the population as a whole. Here also the outlook is poor.

The recurring visits of a patient who has been diagnosed as having a "tension state" or "anxiety neurosis" or as having an irritable bowel syndrome may lull us into a diagnostic lethargy, and we may overlook a developing malignant lesion of the bowel or diagnose it too late. Complete physical examination should be made at regular and definite intervals, in order to protect ourselves and to reassure the patient.

There is no advantage to obesity either from a social, economic or medical point of view. This applies also to obesity in cases of malignant lesions of the colon. Not only does carcinoma tend to spread faster if the patient is obese, but the presence of infection, even in a mild degree, makes the risk materially greater. Given the same pathologic process in two patients of equal age and otherwise equal chances, one finds that the obese patient presents a greater operative risk and has a poorer outlook from the standpoint of ultimate cure.[11]

The older patients, in whom malignant lesions of the colon are most frequent, are in the same age span in which the degenerative diseases of cardiovascular and cardiorenal origin predominate. These concurrent conditions are of prognostic value when considering survival rates and operative procedures.

The findings of the surgical pathologist are of inestimable value when considering the prognosis in any individual case of a malignant lesion of the colon. Broders' classification of the grade of the malignancy and Dukes' classification of the extent of spread are wonderful aids in placing cases in categories. As a rule the prognosis is worse as we ascend the numerical grade of malignancy and descend the alphabet in extent of spread. Nevertheless there are a sufficient number of exceptions to these classifications to encourage one to undertake radical operations in the hope of salvaging some of the patients.

Venous penetration and perineural involvement are factors not diligently sought for by most surgical pathologists. When present, they foretell a very grave prognosis: 95 per cent of the patients concerned will succumb within five years.[12] These factors can explain the poor outcome in a case even though the lesion is small, freely movable, of low grade according to Broders' classification and of a favorable type of Dukes' classification.

The published studies on lymphatic spread of carcinoma of the left colon and rectum by Westhues in the early thirties have been corroborated and extended during the past two decades by the painstaking and meticulous study of pathological specimens by several reputable individuals and clinics.[1,4-7] These special studies have confirmed the great importance of upward spread and have led to the proper evaluation of lateral and retrograde lymphatic involvement. The usual route of spread of cancer is by way of the lymphatics accompanying the superior hemorrhoidal vessels. The spread may be discontinuous, and involved nodes may be found many centimeters proximal to the lesion. Lymphatic spread more than 1 cm. distal to the primary lesion does not occur until proximal lymphatics are blocked, and in any case, distal spread is not extensive. Lateral spread, through lymphatics that course along the levator ani muscle and accompany the middle hemorrhoidal vessels, does not occur as a rule when the distal edge of the lesion is higher than 6 cm. above the dentate line.

The site of the malignant lesion is an important factor when considering the prognosis. In general, right-sided colonic malignant lesions have a better prognosis than left-sided lesions, both in cases with and in those without nodal involvement; in both groups the five-year survival rates show an average difference of about 10 per cent in favor of cases in which the lesions are in the right colon. It is the impression of many surgeons that the better prognosis of right-sided lesions is due to the fact that a right colectomy is routine for these tumors whereas segmental resection is employed for removal of left-sided lesions. A recent innovation is left colectomy for left-sided lesions. Time and statistics will determine whether this added surgical risk can improve the present mortality and survival rates.

True cecal lesions have a poorer prognosis than those occurring in the ascending segment. This has been interpreted on the basis that the resections for cecal lesions have not been as extensive as those for lesions in the ascending segment, that is, they have not been carried around to the mid-transverse colon.

Both the hepatic and splenic flexures are blind spots for the average roentgenologist, and lesions located in these sites may not be detected even when roentgenologic examination has been performed after administration of a barium enema. If clinical symptoms indicate a lesion to be present, an exploration is warranted even if the roentgenograms are negative. The flexures are also more difficult to handle surgically than other segments of the colon because of the great tendency of lesions in these sites to infiltrate the stomach and other vital organs. Lesions of the transverse colon can be included in this last statement.

Tumors of the descending colon and sigmoid have a great tendency to produce obstruction, owing mainly to the smaller calibers of the lumina as compared with the caliber of the right colon. The poorer prognosis of obstructing lesions than of other lesions is well known.

Lesions of the lower two-thirds of the rectum have a poorer prognosis than those of the upper third of the rectum and lower sigmoid mainly because lateral lymphatic spread and local extension to the bladder, prostate or vagina make the disease difficult to eradicate surgically. It is for this reason that I have advocated and practiced radical posterior resection in the Kraske position following previous abdominal exploration and performance of a colostomy. With this operation a hysterectomy or prostatectomy can be done if necessary.

The tremendous advances in the preoperative and postoperative care of patients have demonstrated how important these clinical factors are to the prognosis. They were considered of such significance that many years ago a separate service was organized at the Mayo Clinic for the care and treatment of intestinal obstruction and colonic diseases, which was under the joint supervision of internists and surgeons especially interested in these conditions. This step alone materially favored the prognosis.

In the summer of 1931, Wangensteen began to emphasize the successful decompression of mechanical obstruction of the bowel by nasal catheter suction-siphonage, and a great advance in the preoperative and postoperative care of patients was founded. Malignant lesions of the colon, and especially of the left colon, are frequently accompanied by varying degrees of chronic obstruction and, on occasion, of acute obstruction. The greater the obstruction, the poorer is the prognosis. When there is complete obstruction, the five-year survival rate is twice as poor as when obstruction has not been present.[10] When the ileocecal valve is competent, a closed-loop obstruction results and an emergency colostomy is the treatment of choice, although nasal suction is a valuable adjunct. Nasal suction has its greatest value in colonic surgery as a postoperative prophylactic measure to combat distention and to protect the anastomosis.

The better understanding and appreciation of the physiology and biochemistry of the body fluid compartments, along with the rational replacement and control of the body electrolytes, have favorably influenced prognosis. The development of blood banks made the correction of anemia easier and enabled more extensive surgical procedures to be performed. The investigation of substances other than blood and plasma to combat shock is constantly being carried on at the Mayo Clinic. Such substances as dextran, periston and plasmoid have proved of value and probably will become other adjuncts to safer surgery.

The advent of chemotherapeutic drugs and later the discovery of antibiotics are the highlights of the past decade. During 1939 and 1940 the hospital mortality rate associated with operations on the colon decreased by more than 50 per cent, and this improvement in rate coincided with the first use of sulfonamide drugs in the peritoneal cavity. In 1942, sulfasuxidine was introduced and demonstrated that it was capable of reducing the bacterial content of the bowel many thousandfold. These earlier chemicals and antibiotic agents have now been replaced by better ones, and even better ones may be anticipated in the future. Dearing and Heilman have recently published results of a comparative study of various antibacterial agents on the intestinal tract in man. Their conclusions were that aureomycin and terramycin are superior to all others. At present we are using these drugs exclusively in the preoperative preparation of patients who are to undergo operations on the colon.

It is the summation of all factors determined preoperatively and at the time of operation, by both the surgeon and the surgical pathologist, that influences the surgeon's judgment as to what technique he shall employ and the extent of the resection indicated in the individual case. The size of the tumor exerts little influence on the ultimate prognosis. Of much greater importance in the eventual outcome is the degree of extension and penetration. Cases requiring extensive surgery have a mortality rate at least double that for cases in which the lesions are confined to their primary site.

The development of multiple-stage procedures for surgery of the colon was the result of necessity to overcome the practically prohibitive mortality rate associated with colonic surgery. The three-bladed clamp and the defunctioning of the left colon by means of preliminary colostomy were great innovations. With the discovery and use of antibacterial agents the necessity for multiple stage procedures became less. One-stage operations for lesions of the colon have perhaps made more radical extirpation possible and with a reduction in mortality rate. A place for multiple-stage procedures in my opinion still is advisable under certain conditions such as obstruction, marked inflammatory reaction, unusual obesity or other technical factors which would make the operation unusually hazardous.

The experience and ability of the surgeon as prognostic factors are often lost sight of when considering the ultimate outcome of surgical procedures for malignant lesions of the colon. On the native skill, judgment and experience of the surgeon the operability or inoperability of the lesion will finally rest. The wider the experience of the surgeon, the higher will be the operability rate.

The improvements in preoperative and postoperative care of patients, the better understanding of the modes of spread of carcinoma and the more thorough training of young surgeons have permitted a broadening of the indications for radical surgical intervention and the development, revision and reintroduction of surgical technique which, it is hoped, will improve the prognosis of cancer of the colon even more.

In conclusion let me thank you for the invitation to take part in this memorable occasion.

When I think of Dr. Wangensteen and his indefatigable work in scientific investigation, his truly great mastery as a surgeon and a teacher of surgery, I cannot recall anything more fitting to his voluminous, invaluable contributions than a remark made by Louis Pasteur: "In the field of science chance only favors the mind that is prepared."

PULMONARY AND EXTRAPULMONARY TUBERCULOSIS WITH A DISCUSSION OF THE HOST RESPONSE TO TUBERCULOSIS

DAVID T. SMITH, M.D.
Durham, North Carolina

THE remarkable reduction of the death rate from tuberculosis from 200 per 100,000 in 1900 to twenty-six in 1950 has given many laymen and some physicians a false sense of security and a belief that tuberculosis is no longer a disease of major importance. Although now standing as seventh or eighth among the causes of death in the United States, it is the number one cause of death from infectious diseases and remains the chief cause of death in all individuals between the ages of fifteen and thirty-seven. Recent statistical studies have shown an actual increase in the number of clinical cases while the death rate was declining.[4] This increase is probably more apparent than real and has resulted from the application of mass survey methods to case findings. However, there has been an increase in the percentage of tuberculin reactors among American soldiers who have been overseas and among recent emigrants from Europe.[3]

The tuberculosis problem is no longer the exclusive headache of the sanatoriums and special clinic physicians but has become the headache of every internist. Data obtained by doing a routine x-ray on every patient admitted to a general hospital have been compiled from six widely scattered hospitals and reveal a rate of 1.1 per cent of active cases or a calculated total of 40,000 undiagnosed cases each year in the general hospitals of the U.S.A.[1] Then patients who present symptoms that simulate a great variety of infectious, neoplastic and functional diseases are difficult to diagnose; and it is obvious that many are not diagnosed sufficiently early to be saved by the new treatment with streptomycin or para-amino salicylic acid.

A brief review of the physiological and pathological reactions of the body to the tubercle bacilli and its products should make somewhat easier the task of the internist. The tubercle bacillus produces neither endotoxin nor exotoxin; therefore, the primary reaction of the tissues to the primary invasion of tubercle bacilli is purely a mechanical one to an inert foreign body. The nonspecific mechanical and humoral mechanism is efficient in eliminating saprophytic acid-fast *Mycobacteria.* The avian type of tubercle bacillus is almost always destroyed, and the bovine bacillus is somewhat handicapped; although it is not clear how much of the destruction of the latter two is nonspecific and how much is the result of the development of a low grade but definite humoral immunity.

The human type of bacilli finds a suitable environment for growth and multiplies at a relatively rapid rate for several weeks. During this period of unhindered growth the bacilli are carried by mechanical means, largely in polymorphonuclear cells and monocytes, to the regional lymph nodes and on through the entire lymphatic system to the thoracic duct, the heart, and out to the remainder of the body through the general circulation. The lymph nodes act as mechanical filter beds and those nearest the *point* of primary invasion will show the most enlargement. Thus, we expect enlarged hilar lymph nodes when the primary is in the lung, neck nodes from an infection through the tonsils, mesentery nodes from a primary through the intestine and local superficial nodes from any point on the skin. The *degree* of enlargement varies with the age of the patient and the quality of innate resistance. In children, it is the rule for the nodes to enlarge to a degree which is easily detectable by physical or roentgenographic examination, and in general the larger the regional lymph nodes the worse the prognoses. In adults it is the exception, rather than the rule, for the lymph nodes to be enlarged sufficiently to be detectable clinically. During the past twenty years, we have seen only three students who developed easily detected lymph nodes following the conversion of a negative to a positive tuberculin. As in children, the larger the lymph nodes, the worse the prognoses. Although the percentage of adults who develop clinically detectable lymph nodes is

---

Presented at the John W. Bell Tuberculosis Lecture, sponsored by the Hennepin County Tuberculosis Association, and presented before the Hennepin County Medical Society, March 5, 1951.

Dr. Smith is professor of bacteriology and associate professor of medicine, Duke University School of Medicine.

small, the total number is not insignificant, being about as frequent in a general hospital as lymphomas of the Hodgkin's type and exceeding in number such well-known conditions as hemochromatosis and Addison's disease.[9] About one-half of the patients with progressive primary tuberculosis have palpable spleens. These patients with or without enlarged spleens are usually incorrectly diagnosed as neoplasia, Hodgkin's disease, aplastic anemias, histoplasmosis, or coccidioidomycosis. Unfortunately, as the amount of tuberculosis infection in the general population decreases, more and more individuals will become adults before they receive their primary infection, and we may expect an actual numerical increase in the number of patients with progressive primary infections in our general hospital wards.[9] Before the discovery of streptomycin, the diagnosis in this type of case was purely an academic exercise, but now the difference between recovery and death may depend upon an early diagnosis and prompt treatment.

A second phase of the primary infection of clinical significance is the period of dissemination which begins when the rapidly growing bacilli escape from the lymph barriers and drain into the general circulation. Microscopic embolic foci of bacilli are trapped in the brain, bones, bone marrow, liver, spleen, kidneys and other organs and form the seed from which extrapulmonary tuberculosis develops over the succeeding years. This phase of dissemination is brought to a close after a few weeks by the development of a low grade but definite degree of humoral immunity which is nearly always accompanied by an allergy to tuberculin. There is a difference of opinion as to which of the two mechanisms is more important in reducing if not completely eliminating the dissemination of bacilli. Many investigators believe that the immunity is the result of the allergy. On the other hand, Rich[6] has presented considerable evidence for the belief that immunity and allergy are two entirely separate and distinct phenomena and that allergy is essentially a harmful reaction. One of the complications involved in the problem was the difficulty in demonstrating the presence of humoral antibodies. The ordinary humoral antibodies such as agglutinins, precipitins and complement-fixing antibodies could be demonstrated in experimentally infected rabbits but rarely in patients with active tuberculosis and almost never in patients with early minimal infection. The new serologic method introduced by Middlebrook and Dubos[5] and modified by Smith and Scott[7,8,10] detects antibodies to tuberculin or more specifically to the carbohydrate complex[5] of the tubercle bacillus. It has not been demonstrated that this antibody is a protective antibody but it occurs in patients who have had a recent subclinical infection, as shown by a conversion from a negative to a positive tuberculin reaction, and in most students who have received a BCG vaccination. At least 95 per cent of active incipients and moderately advanced cases have these antibodies in their serum, but cases of tuberculous meningitis and progressive cases of far advanced tuberculosis are usually negative. Thoroughly arrested cases also are usually negative. In a period of months or years after a spontaneous conversion the antibodies disappear while the tuberculin persists. After BCG inoculation the antibodies often persist when the tuberculin test has become negative and in a few instances antibodies have appeared in good titers although the tuberculin test never became positive. Of practical importance is the observation that the tuberculin reactions may induce the appearance of antibodies in patients who had none before the skin test was performed.[10] This irregular behavior lends support to Rich's view that allergy and immunity are different and independent phenomena although both are induced by the tubercle bacillus.

With the appearance of allergy, and the accompanying low grade immunity, dramatic changes occur in the tissues which are reflected in the clinical course of the disease. The local multiplication of bacilli in the tissues is checked and many organisms disappear. But with allergy comes inflammatory reactions which frequently go on to necrosis of tissue and caseation. Tubercle bacilli and tuberculin are no longer inert substances but become highly toxic materials for the "sensitized tissues" although still harmless for the uninfected. The local reactions are redness, swelling, pain and the constitutional reactions include fever, rapid pulse, malaise, anorexia and loss of weight. Laboratory studies show an increase in the sedimentation rate, an increase in the percentage of polymorphonuclear cells, with a corresponding reduction in the percentage and total number of small lymphocytes. The large lymphocytes and monocytes may remain normal but are frequently increased. The constitutional symptoms are in effect the result of a systemic tuberculin reaction and can be duplicated in a thoroughly arrested healthy patient by the subcutaneous injection of a small amount of tuberculin. One of the objects of rest in the treatment of tuberculosis, both the general rest in bed and the surgical measures resulting in localized rest, is to reduce the amount of tuberculin which is absorbed from the local lesions.

Other peculiar characteristics of tuberculosis are the slowness with which resolution occurs and the extensive development of fibrosis in the lesions. The fibrosis may be interpreted as a response to the local tissue necrosis caused by local tuberculin reactions. Some of the slow resolution may be explained by the persistence of tubercle bacilli in the lesions. Tubercle bacilli, in contrast to pyogenic cocci, frequently live for years in the local lesions. But caseous lesions do persist for years after all the bacilli are dead. Tubercle bacilli synthesize *in vitro* and presumably *in vivo* unsaturated fatty acids, which are supposed to inhibit the natural autolytic enzyme systems which liquefy the infiltrates in ordinary pyogenic pneumonias. Therefore, the chronicity of tuberculosis can be explained in part by the persistence of bacilli in the lesions and in part by the difficulty the body has in autolysing and eliminating the granulomatous and caseous product of the reaction between the sensitized tissues and tuberculin.

It is very easy to demonstrate in animals the difference between a primary infection and reinfection. The reinfected animal, whose tissues are already sensitized, shows marked constitutional symptoms within a few hours after reinfection; pneumonic lesions appear in twenty-four hours and large areas of caseation can be found in ten days. More destruction is produced in the lungs and cavity formation is more common, healing by resolution is less complete and more scar tissue residues are left.[2] In animals and in man there is very little if any gross involvement of the lymph nodes in reinfection tuberculosis and the spleen is almost never enlarged. Theorectically, there should be no difference between a primary infection and a reinfection *after* the tuberculin test becomes positive because the tissues after this time are "sensitized" and react specifically to tuberculin. Practically it is impossible in many cases in adults, even with the knowledge of a recent conversion of a negative to a positive tuberculin test, to detect any difference between the x-ray lesion symptom or clinical course of a primary and a reinfection tuberculosis. In these instances there has been no gross infection of the lymph nodes with the primary invasion but the tissues have been sensitive so when tubercle bacilli again reach the lungs the allergic destructive type of lesion occurs. However, I cannot agree with the clinicians, who now constitute a majority, who teach that there is no point in trying to differentiate between primary and reinfection tuberculosis because they all behave alike. Those adults who do develop detectable lymph node enlargement following the primary have more extensive disease and a much worse prognoses than either the primary without detectable lymph node lesions or the classical reinfection syndrome.

There is a difference of opinion about the source of reinfection tuberculosis. Everyone agrees that primary tuberculosis is exogenous in origin and in most cases is inhaled into the lungs. Some, perhaps the majority of clinicians, believe that reinfection tuberculosis is also exogenous and breathed in with the air. The minority of clinicians and nearly all pathologists believe that reinfection tuberculosis is endogenous and reaches the lungs from residual caseous lymph nodes left by the previous primary.[11] I am among the minority of clinicians who believe in endogenous reinfection.

This problem is not entirely academic, since the success of BCG vaccination in preventing reinfection tuberculosis, is dependent in a large measure on which theory is correct. If the exogenous theory is correct, then BCG vaccination can give no better protection than a spontaneous subclinical infection, which results in a positive skin test. If most clinical tuberculosis is endogenous reinfection from caseous lymph nodes left by the primary, then BCG may produce sufficient immunity to prevent completely the infection of the lymph nodes when fully virulent bacilli are subsequently breathed into the lungs. We favor BCG inoculation for medical students, nurses, and hospital attendants but not for the general population in the country.

Tuberculosis is characteristically a relapsing disease. This is not difficult to understand when we realize that viable bacilli may remain dormant for years in relatively insignificant lesions but will become active again when the physiological balance is upset by (1) unusual physical exercise, (2) poor diet, (3) intercurrent infections, or (4) psychic strains of various types. The recent attempts of the thoracic surgeons to cure active, moderately advanced tuberculosis by excising the lobe or lobes which contain the major foci were in most instances disastrous because the small, fresh, but apparently harmless lesions in the other lobes became active and spread throughout the lungs.

Mechanical factors play a large part in the course of tuberculosis. A small lesion in the lungs which becomes caseous and ruptures into a bronchus is rarely serious. A lesion of the same size rupturing into a pulmonary vein results in miliary tuberculosis or one in the brain causes meningitis and miliary tuberculosis. A moderate sized or large lesion in the lung may become caseous but be surrounded by a dense fibrous envelope which prevents the escape of tubercle bacilli and remains a relatively benign tuberculoma. Another caseous lesion of the same size empties its contents into a bronchus and becomes a cavity. The inner wall of the cavity then becomes an ideal place for the multiplication of enormous numbers of bacilli. There is an adequate supply of free oxygen from the bronchus, unlimited food from the serum tissue juices which drain into the cavity and no accumulated waste products to slow multiplication of the bacilli since their products are being continually expectorated in the sputum. The spread of the disease to other parts of the same lobe and to other lobes is most often by mechanical aspiration. The treatment directed toward the closure of cavities is also mechanical. The granulation tissue in the wall of the cavity becomes fibrous tissue which contracts until the cavity is closed unless the process is prevented by other mechanical factors. Rest in bed allows the diaphragm to rise, reduces the pulmonary volume, relaxes the lung and favors cavity closure. Crushing the phrenic nerve, pneumothorax and thoracoplasty are all mechanical processes which relax the lung all favor the fibrous tissue which is trying to close the cavity. Under other conditions scar tissue becomes a liability rather than an asset. Multiple small areas of disease, which caseate but do not excavate, stimulate the formation of fibrous tissue which in contracting may rupture alveoli and destroy the function of the healthy lung.

Although hemorrhage occurs in one-third of all patients with pulmonary tuberculosis, it should be regarded as a mechanical accident. Usually blood vessels are sclerosed by the tuberculous disease before they are eroded. Occasionally the ulcerative process cuts a vessel before it is sclerosed and hemorrhage occurs. If a large pulmonary artery is eroded, the patient dies within a few minutes of an exsanguinating hemorrhage. Fortunately, this is extremely rare. The chief danger of pulmonary hemorrhage is not the loss of blood but the mechanical spread of the disease to other lobes during the hemorrhage.

Pleural, pericardial and peritoneal effusions result from a combination of mechanical and immunological factors. A small lesion ruptures through to a serous surface and an effusion results if the patient has a sufficiently high degree of sensitivity to tuberculin. There is, however, a partial desensitization following the formation of fluid so the tuberculin skin test may be temporarily depressed but returns to or near its former level after the absorption of the fluid.

Streptomycin and PAS (para-amino-salicylic acid) are now accepted as useful agents in the treatment of certain types of tuberculosis. The German drug, TB 1, is much more toxic than streptomycin and PAS and should be used cautiously and only in cases with organisms which are resistant to the other agents. Neomycin is about as effective as streptomycin and works on organisms resistant to streptomycin, but unfortunately produces damage to the kidneys. Viomycin has been used on only a few streptomycin resistant cases. The results were encouraging but there was in some instances a reduction in the calcium and potassium of the blood with the development of tetany.

Streptomycin is definitely superior to PAS. The advantages of oral administration of PAS is almost counterbalanced by the difficulty which many patients have in retaining the drug without digestive disturbances. Tubercle bacilli become resistant to both drugs in a period of twenty to 120 days. The simultaneous administration of 1 gram daily of streptomycin and 8 to 12 grams of PAS about doubles the period of effective treatment before resistant forms appear. Streptomycin has proven most effective in the treatment of tuberculous laryngitis, tracheitis, bronchial tuberculosis, intestinal tuberculosis, and multiple sinuses in the subcutaneous tissue. Acute tuberculous pneumonia and recent bronchogenic spreads often respond in a dramatic fashion. Temporary dramatic improvement in miliary tuberculosis is seen often but the relapse rate is high leaving a respectable residue of 30 to 40 per cent which have apparently recovered. In such desperate cases the dose of streptomycin is high—2 to 3 grams daily—and vertigo and partial deafness frequently results. Intrathecal streptomycin in 100 microgram doses is used in tuberculous meningitis—daily at first and then at longer intervals as the cells in the spinal fluid decrease.

Streptomycin and PAS are of very little value in the ordinary fibrocaseous type of pulmonary tuberculosis. Patients with cavities, particularly, get little benefit from the drugs because the organism rapidly acquires resistance in a few weeks. In general, streptomycin and PAS should be regarded as a supplement to and not a substitute for the standard methods of treatment. They should never be given as the ultimate and definitive treatment but only as a part of a planned course of treatment which usually includes sanatorium residence or some form of surgery. They should not be given to ambulatory patients or patients staying in their own homes except under most unusual conditions.

ACTH produces dramatic but apparently only temporary improvement in patients with tuberculosis.[13] Within two or three days the temperature is normal, the tuberculin test becomes negative and laryngeal lesions show evidence of healing. But when the drug is discontinued the laryngeal lesions relapse, the fever becomes higher than before treatment and the pulmonary lesions may spread. The combination of ACTH and streptomycin is now being investigated. It is probable that ACTH will be found to be useful when used in the proper dose and in the proper combination with other agents.

THE PRIVILEGED FEW

The lie persists and millions of people still believe that capitalists are a privileged few. What makes this lie especially dangerous is that the misguided millions who have accepted it so readily as a fact, are by no means willing to accept it as an unalterable economic condition. Many of them desire actively to do something about it.

They argue, truthfully, that industrial wealth stems initially from the God-given natural resources with which our nation has been so richly endowed; and they insist, quite plausibly, that the basic industries which transform those precious raw materials into useful end products, should belong to the people . . . not just to the privileged few!

I would go even further. I believe that *all* enterprise should belong directly to the people, and I hope that the day will come when every American family will purchase a share of American industry, however small or large that share may be.

That, to me, is true public ownership, and I favor it just as ardently as I oppose Government ownership. Let no one tell you that the two are the same. They are as far apart as the poles.

Today, American enterprise does belong to the people —to the people who have built it with their ingenuity and maintained it with their savings. I know of no other nation in the world where such vast industrial resources as ours are owned and controlled so extensively, and so directly, by the public. I do know of other nations, however, where the Government has seized the industries created by its people, and placed them under control of politicians and bureaucrats.

That, to me, is the antithesis of real public ownership. It is *truly* control by the privileged few!—Reprinted from March, 1951, issue of *The Exchange,* publication of New York Stock Exchange.

PROBLEMS OF RURAL MEDICAL CARE

FRANKLIN D. MURPHY, M.D.

Dean, University of Kansas School of Medicine

Kansas City, Kansas

RECENT dramatic advances in the prevention, diagnosis, and treatment of disease, coupled with more accurate analyses of these advances by the lay press, have served to stimulate and excite the imagination of the people of our country in matters of health. An additional important contemporary influence has been the development of a social philosophy which argues, among other things, that first-class medical care should be available to all citizens under all circumstances. It seems clear that today most people, with rare and unfortunate exceptions, fully accept the principle that the availability of health service is a necessity, not a luxury. This expansion of interest in health services has stimulated the thinking of persons of all groups and in all geographical areas, and this applies particularly to rural and farm groups.

The past twenty years has seen the intensive development of specialization in medicine and in a large measure at the expense of general or family practice. It is not proposed here to argue the merits of specialization except to state that we must somehow get back into our medical thinking the point that it is just as important to have skilled family practitioners who can evaluate the total patient in his environment as it is to have highly skilled technicians who should in effect be only technical consultants. In other words, it is perhaps just as important that the total picture of the physical and emotional needs of the patient be studied through the low-power, wide-angle lens of the family practitioner as it is that certain parts of this patient be studied through the very circumscribed and highly magnified field of the oil immersion lens of the specialist. Suffice it to say, however, that the specialist is almost always attracted to the larger urban areas where are logically located the great medical centers, or at least substantial technical facilities, and other specialists. The rural practitioner is perforce the family or general practitioner. Any pattern which directly or indirectly reduces the production of men interested in general practice will inevitably reduce the flow of practitioners to rural areas. This is an extremely important consideration because well over 40 per cent of our citizens are designated as rural citizens and a system of medical care which is not designed to provide them equally adequate service is in effect a good system of care for little more than half the citizens of our country. The rural family should be entitled to just as good medical care as their urban neighbors. Techniques to provide such care must be continually explored and tested.

Before exploring possible ways of attacking this problem, it is important to evaluate the thinking of people of the rural areas themselves. We in the medical profession, be it in the medical schools or in practice, have fallen down badly in attempting to explain to the people some of the problems involved in providing good medical service and, perhaps more importantly, as regards rural practice, the meaning of good medical service in 1950 and the intelligent use of it.

Fifty years ago when rural roads were mainly mud roads and when the horse and buggy was the main means of transportation, twelve or fifteen miles represented a separation of an hour or more in time. This meant, for example, in a certain county the desirability of a relatively large number of appropriately located physicians. Today that same fifteen miles on all-weather roads with an automobile represents at most twenty or thirty minutes by car. That is to say, fewer physicians are today needed to handle any given geographical rural area. We must explain to the consumers of rural medical care that just because six particular towns in their county had doctors fifty years ago by no means suggests that that same number is needed today. They must be encouraged to think regionally, even in small areas, such as a part of a county. It is true that many citizens of small towns of one thousand people or less who are without physicians and who feel they are remote from medical care are in fact considerably closer to the office of a doctor or a hospital in terms of

---

Acknowledgment is made to the *Journal of the National Medical Association* in which this address was first published in September, 1950. The address is substantially that delivered by Doctor Murphy at the Rural Health Dinner concluding the Annual Meeting of County Officers of the Minnesota State Medical Association, March 3, 1951, Hotel Lowry, Saint Paul, Minnesota.

time than many inhabitants of the large cities of this country. Some reduction in the total number of physicians in rural areas in most states of this country over a forty-year period was to be expected and is quite logical.

The rural citizen too often regards his local physician of 1950, from the scientific point of view, as he did the family doctor of fifty years ago. This, in effect, leads to two things:

1. He will go to his local physician to have a cut bandaged or to get his throat swabbed but for anything more significant will go directly to the larger city. This, in effect, makes the local family practitioner nothing more than a first-aid man, and it is to be hoped that we are not today graduating from medical schools men who are content to be first echelon maintenance men.

2. Furthermore, the young physician settling in a small community by himself is too often driven away by continuing unreasonable demands on his time and energy so that he finds he is working twenty-four hours a day, seven days a week.

The young men and women who leave country practice for such reasons do it justifiably, and communities who do not learn how to utilize their medical service properly will not long keep it, or if they are able to keep it, it will be of an increasingly lower effectiveness. However, as one talks to residents of rural areas and representatives of farm groups, one finds in general that no one has ever tried to explain these relatively simple facts to them and, further, that when they are explained, their basic logic is accepted immediately. This is further proof of the inadequacy of positive lay education on the part of the medical profession.

However, it should not be inferred that we have resolved all of the problems of rural medical care. Such problems exist and they are real and require positive, progressive, and imaginative efforts for their solution. These efforts must emphasize co-operation because of the justifiable feeling that the challenge of the last half of the twentieth century will be as much integrating what we now have in all fields as it will be the further expansion of these fields. Integrated and co-operative effort is economical, not only in dollars and cents but also in time, and is certainly effective. Certain factors loom large in any consideration of rural medical practice.

The lack of tools to practice modern medicine, i.e., hospital and equipment, has been one of the major items influencing young physicians against entering country practice. This is entirely understandable. We train our young men and women in modern hospitals with modern equipment and paint the picture of more and better techniques to come. Is it any wonder that they are then reluctant to go to areas where by virtue of the lack of facilities they are only capable of functioning at 50 per cent of capacity? Probably the greatest single influence designed to correct this deficiency has been the passage and implementation of the Federal Hospital Construction Act (Hill-Burton bill). All over this country, on a decentralized basis, modern well-equipped medical workshops are springing up. This enlightened piece of federal legislation is an excellent example of how government can work with individual communities without compromising the integrity or depressing the initiative of the community. It is also proper and fitting that a higher percentage of these federal funds have been allocated to the lower income states because it is just those states where such facilities are most needed.

However, the original Hill-Burton concept did not go far enough. The average physician will spend much more time working in and out of his office than in and out of a hospital. Therefore, the existence of a modern well-equipped office is also a *sine qua non* to first-rate medical service. The young physician of today on the completion of his internship or a period of residency training is in a much different position than his predecessor of fifty years ago. He has had a longer educational experience and is therefore, older and his expense has been greater. Capital equipment necessary to start practice at a high level is infinitely greater today and, finally, society has begun to recognize a basic biological fact, leading to earlier marriage.

What, then, is the picture of a high percentage of our young physicians desirous of entering practice, and just having completed their education? They are frequently in debt, in their late twenties, often married, with or without children, and facing the prospect of compounding their debts in order to equip themselves to carry out modern practice. They further must consider the acquisition of office space with no guarantee but only the prospect of an income to compensate for these factors. On the other hand, they see in the larger urban areas opportunities to enter practice as associates or partners with already established doctors, with guaranteed income initially and no capital outlay. In effect we then have the situation of the young physician desirous perhaps of living and practicing in a small community but with certain serious problems, mainly financial, to be resolved at the same time that we find many hundreds of communities in which the income level is relatively high and who are anxious to do something in order to attract this physician.

The solution to this dilemna, which is working well in Kansas and other states in the nation, depends upon community initiative, which in turn depends upon medical stimulation and direction. Any town can build and equip a modern medical office or community clinic for between twenty and thirty thousand dollars. This facility is the magnet which draws the young doctor to the town and also guarantees that their doctor can operate at a high degree of efficiency, which is, of course, to the great benefit of the citizens. The money may be raised by bond issue, by private subscription, or by tax levy. Amortization agreements can be made with the young physician so that he may begin purchasing first the equipment and later, if it is mutually agreeable, the building itself. This community clinic may house one or more doctors, possibly a dentist, and would have laboratories, diagnostic x-ray facilities, and the like. In certain instances it would be highly desirable if the county health officer as well as the county health nurse or nurses had their offices in the same facility, in which event one could begin to really speak of a Community Health Center. In certain areas of the country where distances are very great and population sparse, a few hospital-type beds might well be built along with the clinic in order to handle emergency and obstetric cases. One envisages, therefore, at the front line the community clinic or health center backed up by the small rural hospital, which in turn bears a relationship to the medical center of the large city. We hear a great deal these days of "private enterprise" and "local and individual responsibility." Surely the community clinic concept represents local responsibility and enterprise in their purest forms and from such a concept both the consumer and producer of medical care are coequal beneficiaries.

One of the frequently repeated objections of the young physician to remote rural medical practice is the feeling on his part that he will become "medically isolated." We hope that our graduating doctors have a sense of pride in their professional knowledge and ability and a sense of obligation to the maintenance of this ability. To mitigate against such feelings of isolation there must be developed on a broad, realistic and effective basis postgraduate programs, tailor-made not for some theoretical ideal but for realities. Such programs must include:

1. The so-called refresher-type courses usually held at a medical school or medical center, lasting from three days to a week, well prepared and well integrated.

2. Circuit-type courses in which medium-sized communities strategically located throughout a given geographical area are chosen as centers. Teams of physicians may then, monthly or oftener, go out on this circuit with up-to-the-minute prepared discussions of practical every-day therapeutic and diagnostic problems. Experience has shown that this method of carrying education to the busy practitioner is very effective, not only in terms of transferring practical information but also in academically stimulating him at frequent intervals.

3. Opportunities must be made particularly for men in general practice to return to the medical school or medical center at intervals of several years and for periods of time ranging from one to twelve months. This educational experience, which might be called "in-residence" as differentiated from "residencies" for specialities, should provide a minimum of didactic training, and a maximum of "laying-on of the hands" experience. Such opportunities should be available in all fields of medicine.

4. Residency training programs in the various medical specialities should be continued and strengthened, not quantitatively but qualitatively. Furthermore, the man who has had a general practice experience should certainly have as great an opportunity to enter such residency programs as the man who has just completed an internship.

If the above-mentioned techniques are carried out effectively, certainly the medical schools will be able to indicate to their graduating students that no matter where they practice they will not be far distant from the stimulating influence of continuation education.

One problem that remains as yet unanswered is that of the quantity of production of doctors, nurses, and technicians of all types. It is clear that if we are underproducing the medical personnel, no technique, however attractive, will get enough people to all of the right places. On the other hand, it would be an equally serious and wasteful mistake to supersaturate this country with an excess. The answer to the question of shortage or excess is not clear to the author. Perhaps the answer lies approximately in the statement that there is now an over-all numerical shortage which, however, may soon be taken care of by the expansion of exisiting medical schools. In any event, a more precise answer may be available after the completion of certain major surveys now under way, particularly one on the problems of medical education being carried out jointly by the Association of American Medical Colleges and the American Medical Association and the broad-gauge survey of the Brookings Institute.

It should be noted that some of the techniques described above are mainly possible only in an area of relatively high per-capita income. In such states, individual initiative and local enterprise are capable of bearing most of the load. In those areas of our country where per-capita income is below standard, it seems clear that government, be it local or federal, will have to take larger and more positive steps in both the provision of adequate facilities and, more particularly, in the possible subsidy of the health personnel necessary to operate these facilities. No physician who subscribes both literally and morally to the Hippocratic Oath and the American Constitution can deny the obligation of providing such fundamentals as adequate educational opportunities and first-class medical care to all people regardless of race, color, creed, or income status. It is high time for local and federal government as well as the members of the health professions to sit down and work out some of these problems on the principle that certain basic needs must be filled with the government providing aid only when local and individual responsibility cannot carry the full load.

There are today many young physicians in training who dislike the pressures and tensions of urban living. They would like to raise their children and cast their lot in smaller, more rural communities. Certain techniques to encourage them in their plans have been tried and found useful in various parts of the country. They require for their general implementation an understanding of the realities of modern medical practice on the part of both medical schools and the consuming medical people. They provide a great challenge to various segments of the health professions to demonstrate imaginative, thoughtful, and progressive medical statesmanship and, most of all, they provide both the producer and consumer of medical care with those conditions necessary for happy professional and social living.

RHEUMATIC PNEUMONIA

ROBERT B. TUDOR, M.D., and ROBERT R. KLING, M.D.
Bismarck, North Dakota

BECAUSE of the relative rarity of rheumatic heart disease in children terminating with a fulminating pneumonia, this case is reported in detail. Though existence of a specific rheumatic pulmonary lesion has been denied,[5] a characteristic pathologic picture which occurs only with rheumatic fever has been recognized.

The exact etiology of this pneumonitis is not known. It has been shown[2] to parallel the pulmonary histopathology seen in experimental and sulfonamide anaphylactic pneumonitis. Pathologically there have been described:[3-6]

1. Fibrinous exudates in the alveoli, which are sometimes transformed into hyaline pseudomembranes.
2. Necrosis of the alveolar walls.
3. Arteriolitis, which resembles that seen in periarteritis nodosa.
4. Focal inflammatory infiltrates, which are chiefly mononuclear.
5. Granulomas, or Masson bodies.

Clinically, two syndromes have occurred, fleeting, reversible pneumonia, without respiratory distress,[1-5] and suddenly developing, fulminating pneumonia, with severe dyspnea and cyanosis.[4-6] I have been able to collect eight cases of this severe rheumatic pneumonia from the literature (Table I). Case 4 is that of a three-year-old white girl who, after five attacks of febrile arthritis in two months, developed sudden dyspnea and a pneumonia.[5]

Case 7 was a five-year-old white boy who became anorexic and feverish and then developed pancarditis and fatal pneumonia and expired in ten days.[6] All of these reported cases were ultimately fatal, though Case 1 had three recurrences before death.

Radiologically the findings more closely resemble those of cardiac failure than those of pneumonia.[1-5]

Report of Case

Case 9.—S. D. was a six-year, five-month-old white girl who was seen because of a pruritic rash on the body which developed about April 8, 1950, and changed in character daily. She had never had any previous illness. There was no recent history of immunization or other injections. The father and mother were well. Six siblings were in good health. There was no family history of allergy or any chronic illness.

Examination disclosed a fairly well-nourished and well-developed child. There were large urticarial lesions generalized over the skin. There was no general glandular enlargement. Tonsils were red. Heart and lungs were normal. Liver, spleen, and kidneys were not palpable. Extremities were normal. She was given 400,000 units of procaine penicillin, 0.2 c.c. of 1:1000 adrenalin, and put on Elixir Benadryl, 2 drams three times daily.

She was again seen on April 18, when most of the urticaria had subsided. On May 9, she was seen with a temperature of 102° and acute tonsillitis. On May 11, she had developed a generalized rash. Examination disclosed an acutely ill, dyspneic, pale child who had large, angular, erythematous lesions of the body. There was no general glandular enlargement. Head and neck were normal. Eyes and ears normal. Tonsils were prominent. Heart rate was 160 with a gallop rhythm at the apex. No murmurs were heard. Lungs were clear. Liver, spleen and kidneys were not palpable. Genitalia were normal. Extremities normal. The impression at that time was rheumatic fever with erythema marginatum.

Accessory Clinical Findings.—Temperature was 105.° Electrocardiogram showed P-R interval 0.16; Q-T 0.32. P-1 was flat; QRS 1-3 low amplitude; T 2-3 depressed. Urine was normal. Hemoglobin 67 per cent; white blood cells 19,000; polymorphonuclear cells 76 per cent; lymphocytes 32 per cent. X-ray showed a dilated heart with possibly some pericardial effusion. She was started on penicillin and aureomycin.

On May 15 aspirin was begun in dosage of one grain per pound. Vitamin K, and ascorbic acid were also given.

On May 16 a systolic murmur was audible at the apex. The temperature varied from 99° to 103.6° By May 19 the heart rate had slowed to 100°, and she was not dyspneic. Bone marrow aspiration at this time showed only a granular cell hyperplasia. No L.E. cells were seen. Blood culture was negative. Tuberculin test was negative. On May 22 a presystolic murmur was heard at the apex. About May 22 she was taken out of oxygen, and from then on, even though she had some fever, she was able to lie flat in bed and was eating fairly well. On May 24 a diastolic murmur was first heard. She was given four small blood transfusions and seemed much improved. Sedimentation rate on May 26 was 45 mm. per hour.

On the morning of May 31, 1950, the ears and throat were normal, the heart tones were soft, and the systolic

*Cases 1 through 6—Seldin, Kaplan, and Bunting[5]
Case 7— Smith[6]
Case 8— Nittono and Hoshiyama[4]
Case 9— Kling and Tudor

and diastolic murmurs were decreased in intensity. The liver, spleen, and kidneys were not palpable. A few râles were heard in the hilar areas posteriorly. Temperature was 100.4 rectally. At 7:30 p.m. she was coughing continually and was cyanotic. At this time there was considerable consolidation of the right upper lobe with bronchophony and crepitant râles. She expired at 10:45 p.m.

Pathological Report.—The body was that of a somewhat undernourished but well-developed female child six years of age. There was no jaundice, petechiae, or superficial adenopathy. The chest and abdomen were opened in the usual manner. The entire bowel was a light gray color, only slightly distended, and there was no evidence of peritonitis. The liver weighed 1,050 grams and showed marked congestion about the central veins. The gall bladder was normal and the biliary ducts were patent. The pancreas appeared normal. The spleen weighed 85 grams and yielded abundant scrapings to the knife blade. Its markings appeared normal. Both adrenals appeared normal and showed no evidence of hemorrhage. The left kidney weighed 75 grams and the right kidney 80 grams. Their capsules stripped readily, leaving a smooth underlying surface. On section there was a well-demarcated cortex and medulla. The calices, pelves, and ureters appeared normal. The mucosa of the urinary bladder was normal in appearance. The uterus and uterine tubes were extremely small. The ovaries appeared normal.

Posteriorly, the right pleural cavity was obliterated by fibrinous adhesions and contained 40 c.c. of straw-colored fluid. The left pleural cavity contained adhesions in the apical region and 20 to 30 c.c. of straw-colored fluid was present. The right lung weighed 625 grams. The upper lobe was completely consolidated, and the middle and lower lobes, except for small areas at the respective inferior borders, were also completely consolidated. The lung appeared rubbery to the touch and on section appeared dark purple. The left lung weiged 440 grams and showed a patchy consolidation throughout both lobes. The pericardial cavity contained approximately 30 c.c. of straw-colored fluid, and fibrinous adhesions were present between the visceral and parietal pericardium over the apex and left ventricle. When the adhesions were separated, a typical shaggy "bread and butter" appearance resulted. The heart weighed 240 grams. The right auricle and ventricle were markedly dilated. The musculature of the left ventricle was somewhat hypertrophied. The mitral valve was plastered to the endocardium and superficially exhibited a number of small, hard ridges, the largest of which measured about 2 mm. in diameter. The valve appeared reddened and the chorda tendioneae were somewhat shortened. The other valves appeared normal. The thoracic and abdominal aorta was smooth and flexible.

Histologic Examination.—This revealed numerous Aschoff nodules in the interstitial myocardial tissue. There were also scattered foci of polymorphonuclear cells throughout the myocardium. The pericardium was diffusely infiltrated with inflammatory cells and the mesothelium was lacking. Sections of the mitral valve showed a diffuse round cell and polymorphonuclear cell infiltration. The lungs showed an intense exudative inflammatory reaction. Most of the alveoli were completely engorged with red blood cells and alveolar phagocytes, while a few were completely filled with polymorphonuclear cells. Many of the alveoli were filled with a fibrinos exudate which was often organized into fibrin plugs, and in some, hyaline pseudo-membranes were visible. The interstitial tissues contained infiltrates of mononuclear cells. A rather generalized arteriolitis was present. Occasional granulomatous foci were seen in the alveolar ducts. The interalveolar capillaries were intensely congested and the pleurae were

OPERATING ROOM CHOLANGIOGRAMS

ARTHUR ZIEROLD, M.D.
Minneapolis, Minnesota

FOR many years surgeons have been plagued by postoperative biliary obstruction, due for the most part to stones overlooked and less often to biliary duct injury sustained in the course of operation. It has been almost everyone's embarrassing experience to note the occurrence of biliary colic and the development of jaundice after having but recently explored and presumably emptied the common duct. It has also been the misfortune of many of us to have removed the gall bladder and to have had the patient subsequently develop jaundice after having palpated and examined the common duct and satisfied ourselves that it contained no stone. Heretofore, the means at our disposal for examining the common duct before and after operation has entailed opening and exploring it mechanically with sounds, forceps and scoops of various sizes. This has been not an altogether satisfactory procedure. Stones have been missed, the ducts have been injured and the base has been laid for future stricture. Moreover, such exploration has been attended by a definitely increased risk.

Lahey, in a series of 2,000 personal cases, reports a mortality for cholecystectomy of 4 per cent. When the common duct is explored, this mortality increases to 13 per cent. Cole, reviewing many series of cases reported by various surgeons, reports an over-all mortality for cholecystectomy of 6.5 per cent and for common duct exploration of 10 per cent. It is obvious that such a mortality is too great to justify choledochotomy as a routine procedure. For this reason as well as the unfortunate complications aforementioned, an effort has been made to develop a method whereby the integrity of the common duct could be determined without increasing the mortality.

Examination of the biliary system by x-ray and radio-opaque materials is not new. As a postoperative procedure it has been employed for many years with variable degrees of satisfaction. In 1932, Mirizzi proposed that a cholangiogram be made on the operating table before closure of the abdominal wound. In 1936, Best and Hickem added their support to the idea. Following this with some slight modification, the results of such a procedure have been reported by a number of surgeons. Broadly stated, the indications for operating room cholangiograms exist if there is reason to suspect stones within the biliary tract or any distortion or interruption of its continuity. Inasmuch as every patient having stones in the gall bladder is a potential carrier of stones within the common duct, this statement really implies that every patient having an operation upon the biliary tract should be examined by a cholangiogram made on the operating table.

The cholangiogram, to be adequate, involves the co-operation of surgeon, anesthetist and roentgenologist. Each must realize what is to be attempted and must contribute intelligently his part in the procedure. The surgeon must so plan his approach that without loss of time he may provide a field easy of access for the roentgenologist after having given the anesthetist sufficient warning and time for preparation of the patient. The technique of performance is not difficult or involved but is exacting in its details. The patient is placed on the operating table with a tunnel sufficiently deep to hold a cassette beneath the region of the gall bladder. A preliminary film is exposed to check the location and determine the necessary time of exposure. When this has been satisfactorily determined, the abdomen is opened in the usual manner. It is the practice of some operators to expose the common duct at once and open it sufficiently wide to permit the insertion of a T-tube, whereby the cholangiogram is made. As this procedure at once accepts the increased risk of choledochotomy, it does not appear to be justified as a routine procedure. Furthermore, I do not believe that it is necssary in order to obtain a satisfactory cholangiogram. Several have attempted to avoid opening the common duct by injecting the radiopaque substance through a needle. In my hands this has proved most unsatisfactory. The needle, if sufficiently large to complete the procedure satisfactorily, often injures the common duct and permits leakage after withdrawal. This not only at times obscures the cholangiogram but may invite complication from escape of bile. If a fine needle is used, it is difficult

to aspirate and examine the bile and also difficult to determine the intraductal pressure during injection.

It is our practice first to remove the gall bladder and, after carefully isolating the cystic duct, to cut the duct, leaving it about 1 inch in length. A small probe is then introduced to determine its patency. At times a small retained cystic duct stone can be identified. At other times it will be found that the Heisterian folds are difficult to pass and constitute an actual obstruction to injection. Once the cystic duct has been sufficiently opened, a soft silver cannula 1 or 2 millimeters in diameter is inserted and tied firmly with catgut. The cannula must be inserted carefully because of the danger of perforation of the thin cystic duct or common duct wall. It is safer and quite as satisfactory to insert the cannula only into the cystic duct and not allow it to enter the common duct itself.

The earlier attempts at cholangiography were made with lipiodol, but because of its viscosity and tendency to entrapment of air bubbles, this material was discarded. Thorotrast was also employed at one time, but it was found that leakage into the peritoneal cavity of even small amounts results in a chemical peritonitis of serious nature. The medium commonly employed at present is one of the iodine compounds used in intravenous urograms, such as diodrast or iopax. The material is aqueous, non-irritating and sufficiently fluid to enter the small biliary radicles without excessive pressure. In the normal biliary tree the injected substance, diodrast or iopax, may be used in full strength. If, however, the duct is enlarged, the material should be diluted one-half so that the density of the material does not obscure the defect caused by a small stone.

As before noted, a small cannula is tied in the long cystic duct and attached to this is a 20 c.c. Luer syringe with rubber tubing and connector 12 inches in length. The syringe is filled with normal saline, and the system is cleared of air bubbles and then connected. Twenty to 30 c.c. of saline is then used to irrigate the biliary tract. The syringe is then filled with 20 c.c. of diodrast, which is injected slowly. If the injection is made too rapidly and the common duct is distended too suddenly, sphincter spasm will result and frequently the patient will be so disturbed as to require deeper anesthesia. If the patient is under pentothal anesthesia, too rapid injection may cause laryngospasm. Toward the end of the injection, all metallic substances are removed from the field, which is then covered with a protecting drape, and the x-ray apparatus is wheeled in position. During the period of injection, the anesthetist has by means of oxygen and forced respiration induced a state of apnea. When advised by the surgeon that injection is complete, the anesthetist stops the respiratory motion. The signal is given to the roentgenologist who immediately exposes the film for a period ranging from ½ to 1 second. In the average case the readings are as follows:

80 kv, 40 ma, 30 inches distance with cone attached, .7 second time. The plate is then removed from the tunnel and a second plate inserted. Immediately a second exposure is made in the same manner as the first. This permits further diffusion of the dye and reduces the percentage of error due to motion. The films are developed immediately and examined in the operating room. In the event that they are not sufficiently clear or that the proper field has not been included, the procedure is repeated. If the cholangiogram is normal, the cystic duct is tied and the excessive portion is removed together with the cannula. If, on the other hand, the cholangiogram presents evidence of abnormality, the cannula is removed and the duct tied in the same manner, and the common duct is then exposed for exploration. At the end of exploration and the removal of any obstructing material, a T-tube is placed in the common duct and sutured in place with 5-0 chromic catgut. The tube is then connected with a syringe filled with saline and again the biliary tract is irrigated. Following thorough irrigation, the biliary tract is again injected with diodrast and x-ray films are made as previously. When the films show no further evidence of retained stone and when the dye passes readily and can be demonstrated in the duodenum, the wound is closed and the operation considered complete.

On occasion, particularly after trauma to the duct in the removal of a stone, the final cholangiogram made through the T-tube will show evidence of sphincter spasm which may temporarily obstruct the flow into the duodenum. If this occurs on the preliminary cholangiogram or on the final film, amyl nitrite is administered by inhalation. This relaxes the spasm and permits the diodrast to pass freely into the duodenum. In certain cases it may be desirable to demonstrate the pancreatic duct and its relation to the common duct. If this does not occur in the usual course of injection, it may be obtained by following the procedure of Doubilet.

Summary

In operations upon the biliary tract it is desirable to know whether or not stones are present in the common duct. An operating room cholangigram provides this information without choledochotomy and without increased risk.

RHEUMATIC PNEUMONIA

(Continued from Page 438)

infiltrated with inflammatory cells. No bacteria were found on the lung on direct smear. The spleen was markedly congested and showed a definite lymphoid hyperplasia. The kidneys and adrenals appeared normal. The liver showed moderate central lobular congestion.

Cause of Death.—(1) Acute fulminating exudative pneumonia—etiology unknown. (2) Acute rheumatic fever.

Anatomical Diagnosis.—(1) Rheumatic pericarditis, myocarditis, and valvulitis. (2) Pericardial effusion. (3) Acute fulminating exudative pneumonia—etiology unknown (rheumatic ?).

Summary

An acute fulminating lobar pneumonia which occurred twenty days after the onset of rheumatic heart disease in a six-and-a-half-year-old white girl has been reported. It is theorized that this acute fulminating exudative pneumonia was rheumatic in origin.

PRACTICAL POINTS IN ALLERGY

JOSEPH H. SHAFFER, M.D.
Detroit, Michigan

THERE are probably no individuals quite so miserable, unhappy and chronically ill as those who suffer from major allergic conditions, and again, there are no patients more grateful when afforded some measure of relief. With diligent study of the problems, and with application of common sense in setting up a plan for treatment and control of troublesome factors, relief from symptoms is an attainable objective.

Regardless of our individual interests in medicine, it would seem that we, as physicians, should recognize an allergic condition and be ready with some basic plan of procedure when such an individual enters our office. Notwithstanding the numerous press releases to the public heralding new "cures" for allergy, there is no short-cut we may take in controlling allergic conditions. It is true that the many new "allergy" drugs materially assist in the symptomatic treatment of such conditions, but this is not enough. We must concern ourselves with measures which strike at the problem from a physiological and immunological point of view.

In our study of patients, we should (1) look for symptoms and history data pointing to a diagnosis of allergy, (2) proceed in an orderly manner with study and investigation, and (3) develop a logical and simplified, yet effective therapeutic plan. With some practice, an interview with an allergy patient need not be lengthy; time thus spent, however, in my opinion, is the most profitable step we may take in our attempt at getting at the underlying causes. The problem can be fairly well crystallized at this point and before the patient is ushered into a testing booth. Physical examination and protein tests, selected with the thought in mind of verifying our clinical opinion, help us to put "teeth" into our diagnosis. Symptoms present the year around set off a chain of thought and action along one line, while the presence of sharply delineated seasonal symptoms only narrows the scope of the problem greatly. Since allergic changes may affect every tissue in the body at some time or another, symptoms may be numerous and variable. In addition to such well-known allergic conditions as hay fever, nasal allergy, bronchial asthma, eczema, urticaria, angioneurotic edema, and drug allergy, we now have allergy under consideration as playing a prominent role in arthritis, periarteritis nodosa, ulcerative colitis, pulmonary tuberculosis, rheumatic fever and headaches.

For the past two years we have been successful in reducing the incidence of the common respiratory infections. Antihistamine drugs administered early often effectively control coryza, sneezing, and edema of the upper respiratory tract mucosa, and may abort the process completely. Additional therapy with bacterial vaccines, dust and mold extracts has been most helpful; patients who, prior to treatment, experienced three to five respiratory infections during winter months have been kept entirely free of the common cold. This experience lends credence to current opinion that respiratory infections are superimposed upon allergic tissues, or that allergy, at a subclinical level, is often present in the cold-susceptible individual.

Reactions to drugs, chemicals and antibiotics are encountered almost daily in our practice. Perhaps we, as physicians, are unwittingly sensitizing a large cross-section of the population. It is not uncommon to treat a scratchy throat with penicillin, only to have our patient hospitalized for a week or so because of a severe reaction to that drug. Almost any of the medications we use in our every day practice are potential sensitizers of the patient. Complications and untoward reactions may cause conditions far more serious than the original ailment under treatment. Oral penicillin preparations commonly cause reactions, while aqueous intramuscular preparations are hardly ever at fault.

We cannot stop with an analysis of the allergy problem alone but must proceed with an evaluation of the total health status of the individual. We are doomed to failure before we start protein desensitization, unless we give proper corrective consideration to such problems as malnutrition, anemia, hypothyroidism, nervousness and frank foci of infection. Just as important as is exposure

---

Read before the American Academy of General Practice of Wayne County, First Postgraduate Lecture, October 27, 1949.

Doctor Shaffer is Physician-in-charge, Allergy Clinic, Henry Ford Hospital, Detroit, Michigan.

to antigenic substances are the conditions that lead to emotional instability, unhappiness or worry. Observations during the pollen season last year convinced us that patients experienced marked exacerbation of symptoms, independent of the pollen level, when there was a sudden drop in temperature, when the barometer was changing, or when the humidity soared into the nineties. Such conditions, however, are beyond our control.

Changes in environment are most important and should always be considered as a possibility. Are there new rugs, furnishings, pets, insecticides, chemicals, hobbies, clothes, cosmetics, or has a remodeling job been done on the home? Introduction of rock wool insulation into the walls of a cottage, with resultant condensation and mold, caused illness in one of our patients. He could sleep peacefully on his back porch, but experienced severe asthma when in the house more than fifteen minutes. Another patient could sleep at the home of his sister, while thirty minutes in his own home was followed by severe asthma; the problem was one of a moldy basement.

Next to a well-taken history, nothing is more valuable than a thorough examination, which may require assistance from one or several specialists in the various fields of medicine. X-rays must be considered as important in the study of the asthmatic chest, and pathology in the paranasal sinuses should not be overlooked. Serious headaches should be studied by the neurologist. The general practitioner is in an enviable position—it is he who knows the family, the patient and his problems, and it is to him that the patient first turns for help.

Protein tests enjoy entirely too much popularity, in my opinion, as a method of diagnosing an allergic condition. When used as is any laboratory procedure to confirm our clinical suspicions, they may prove quite helpful, but when made the sole basis for our diagnosis, they may be highly misleading. If they confirm our clinical impressions, accept the results; if they do not make sense and do not fit the picture, it is best to toss them aside.

Mass testing with hundreds of substances is unwarranted and is less desirable than selecting a few well-chosen substances which are deemed important from our review of the history of the case. A high percentage of positive tests on a single test subject is most unusual and should warn us that *dermatographia* (irritability of the capillary bed of the skin) and *not allergy* is present. Control tests are always positive when applied to such a skin and should always be applied. Draw your fingernail or a blunt instrument across the skin and you will note the appearance of a red wheal.

Safety is necessary in the testing rooms. We have made it a rule to apply scratch tests initially, especially when testing individuals in whom we suspect a high degree of sensitivity, when testing children, and adults who are in an extremely weakened physical condition. When necessary we retest with intradermals. Block testing is helpful in avoiding the constitutional reactions which are always a possible source of danger. Although tests may be applied by a nurse, or well-trained technician, the physician should make frequent observations during the test period and make all interpretations.

Every allergist has his favorite list of foods that he considers troublesome. Rowe considers food to be the most troublesome and leading causative factor in all forms of allergy. We cannot duplicate his experiences in our large and busy allergy clinic. Allergists, by excluding numerous basic foods from diets, are large contributors to the malnourished condition of many patients. We should think carefully and have a sound basis for our action before we make such limitations in any diet.

This year, as in the past, patients have experienced aggravation of hay fever symptoms when they are partaking abundantly of freshly harvested fruits and vegetables; at other seasons of the year such foods may be eaten with impunity. Uncooked fresh fruits and vegetables are high in antigenic quality. Cooking remedies this condition; it is well known that thorough boiling, or substitution of soy-bean milk, often is helpful in handling the milk-sensitive individual. It is best to serve moderate helpings and to rotate items in the diet.

Thousands of individuals suffer from hay fever. During the past summer pollination was unusually heavy, and sufferers were numerous in the untreated group. We, as physicians, should advise our patients that there is no better or more reliable method than pollen extract therapy. It is true that the ever-growing number of antihistamine drugs are helpful in the control of symptoms but will not furnish adequate protection for the highly sensitive individual. We should remember that as ragweed pollen disappears in late September, our patients may continue to have symptoms. In this group we should suspect dusts, *Hormodendrum* and *Alternaria* of the mold groups as added troublesome factors.

Hay fever is caused by the pollens of trees, grasses, and ragweed; patients sensitive to all may have symptoms from April through September. Such pollens are abundant and depend upon the wind for distribution, while flowers with their gay colors attract bees and insects, which spread the pollen about. Florists and funeral directors, however, may develop a high degree of sensitivity, but for practical purposes we need not consider flowers as creating a major problem in the control of hay fever. "Rose fever" is most often found to be due to tree and grass pollens. Goldenrod may be unjustly accused of causing symptoms which are in reality due to the drab and unnoticed ragweed in the same vicinity. We should know that heavy pollen counts are encountered in the nearby states of Ohio, Indiana and Illinois, and that certain areas in Michigan are extremely low; such localities afford a haven of refuge for our patients.

Pollination charts compiled by Durham and Tufts have been most helpful to allergists. From such charts we learn that trees begin to pollinate in mid-March and April, grasses in May, and ragweed in late July.

Spring Hay Fever

Pollens from practically all trees may cause hay fever. In this area poplar, oak, elm and maple are chief offenders. Symptoms as a rule are usually mild and may easily be controlled with symptomatic measures. There are patients, however, who are extremely sensitized to these pollens; they should receive pollen extract therapy, beginning not later than mid-January.

Early Hay Fever

Grasses pollinate sufficiently to cause symptoms from early May through July. Chief offenders in this area are timothy, June grass, Orchard grass and Red Top; they are all found in the usual lawn grass mixtures for sale at the hardware store. In our treatment mixture we include extracts of the pollens to which our patients show a wheal and pseudopod reaction on skin testing. Such injections should be started not later than mid-March.

Late Hay Fever

Giant ragweed pollination begins about July 20 and becomes clinically important in mid-August. Low ragweed pollination reaches a peak about mid-September. We start patients on mixed ragweed extract not later than mid-May.

We favor the preseasonal treatment plan as mentioned above, and use it in preference to the perennial and co-seasonal. We start with dilute mixtures of extract and gradually increase dosage and strength as treatment progresses, ever on the lookout for overdosage as manifested by minor intolerances or the more serious constitutional reactions. We give pollen extract subcutaneously once a week. We ask our patients to remain in the waiting room for twenty minutes following injections; should an untoward reaction occur, they are then readily available for treatment. Should mild reactions occur, we give one of the antihistamines; should the reaction be more serious, a tourniquet is applied above the site of injection, and epinephrine (3 minims of 1:1000) is injected into the opposite arm.

When patients report for treatment, they are questioned closely regarding possible delayed reactions from the previous injection. When necessary, adjustments of dosage levels are made. Since it is impossible to predict accurately any dosage schedule which will fall within the tolerance level of the patient, and since treatment must be highly individualized, it is unwise and dangerous for doctors not to personally supervise pollen extract therapy.

Perennial Vasomotor Rhinitis

At this particuular season we see many patients with exacerbations of year-round symptoms such as stuffy nose, post-nasal drip, sinusitis, and attacks of sneezing. Such symptoms are due to nasal allergy and are often associated with a high degree of susceptibility to the common cold. Patients in this group are usually found to be sensitive to feathers, dusts, furniture stuffing, lint from carpeting, molds, and fumes from chemicals and insecticides. Prolonged use of nose drops may be an aggravating factor; we do not prescribe them. Metabolic changes in hypothyroidism and pregnancy may aggravate the nasal condition, as will highly seasoned foods, chocolate, eggs, milk, and alcoholic beverages. This group of patients is indeed most difficult to treat, and requires patience, perseverance and resourcefulness on the part of the patient as well as the doctor. Treatment includes strict allergic cleanliness, hyposensitization therapy with bacterial vaccines, dust and mold extracts. Antihistamines may materially assist in temporary control of symptoms.

Bronchial Asthma

Our basic plan of therapy for the asthmatic patient is five-fold. It calls for: (1) relief of bronchospasm (bronchospasmolytic drugs); (2) evacuation of mucus from the bronchial tree (bronchoscopic suction and lavage, use of iodides followed by postural drainage); (3) treatment of infection (penicillin, streptomycin, aureomycin, chloromycetin); (4) control of allergic factors (hyposensitization with dust and mold extracts, bacterial vaccines, allergic cleanliness, and protective environment); and (5) general supportive measures deemed necessary to correct anoxia, dehydration and malnutrition.

With such a comprehensive treatment plan it is obvious, I believe, why we are unsuccessful in the treatment of bronchial asthma, if we rely solely on one of the newer "miracle drugs" for results.

The Asthmatic Emergency.—The most frequent emergency condition encountered in our clinic is the patient with acute asthma. We have found it necessary to develop a dependable treatment routine adaptable to office practice. Many patients are promptly relieved, and are thus enabled to carry on with out-patient therapy; hospitalization is thus reserved for the desperately ill patient whose asthma may be complicated by cor pulmonale, severe peripheral vasomotor collapse, acute infection, or severe anoxia, dehydration and malnutrition.

Office Emergency Treatment.—

1. Triple intravenous therapy.—Glucose 100 c.c. in 5% concentration, in water; Aminophyllin Gr. 3¾; Sodium iodide 100 c.c. in 10% concentration. Mix together in cylinder and give *slowly* over twenty-minute period.

2. Epinephrine.—Give 2 to 3 minims (1-1000) "H" while the intravenous is running. Give hypodermically.

3. Penicillin.—Give aqueous intramuscular, 300,000 to 400,000 units, if there is a history of recent infection, purulent sputum, fever or leukocytosis. (Repeat 1, 2 and 3 daily for three or four days and then twice weekly.)

4. Search for precipitating factors.—While the patient is resting for twenty to thirty minutes after the above treatment, elicit data for the history. Avoid basing your treatment plan on drugs and medications previously tried and found ineffective. Antihistamines may be quite helpful in treating the asthmatic child but often aggravate asthma in the adult. We do not use antihistamines in the adult asthmatic patient. Iodides are most helpful and are necessary to thin the thick mucus which plugs the bronchial tree. Get rid of this mucus and you are well on your way to therapeutic success.

5. Medications for continuing treatment at home. (a) Bronchospasmolytic drugs (select one): Nethaphyl—one capsule three or four times daily or one capsule at onset of wheezing. Quadronal—one tablet three times daily or one tablet at onset of wheezing. Amesec—one tablet or capsule three or four times daily or one tablet at onset of wheezing. (b) In addition to above start patient on Hydryllin one tablet after each meal and one at bedtime. (c) Start an iodide preparation: Syrup of Calcidrine—one teaspoonful after each meal or Potassium iodide enseals—one after breakfast and supper. (d) Asthma Mixture (HFH Formulary): This medication has proven effective over a period of many years, and is quite helpful by itself or may be used in conjunction with any combination of the medications listed above.

ASTHMA MIXTURE

Tincture belladonna	10.0
Ephedrine sulphate (3%)	30.0
Codeine sulphate	0.6
Chloral hydrate	15.0
Syrup of hydriodic acid q. s. ad.	240.0

Sig.: One teaspoonful every four to six hours as necessary for asthma.

Long Range Treatment Program.—After the acute emergency condition has been brought under control, we must next consider, and institute a long range therapeutic program. Suggestions listed below may prove quite helpful.

1. Culture the sputum.

   Lack of response to adequate penicillin therapy may be due to Gram-negative organisms. If so substitute Aureomycin or Chloromycetin for penicillin.

   Chloromycetin—initial dose 1 gram, then ½ gram every six hours for five to seven days.

2. Protein test survey.

   Delay protein testing for several weeks after status asthmaticus has cleared. Use information gained from protein testing, along with facts as elicited in the history, to set up hyposensitization therapy with pollen extracts, dust and mold extracts, and bacterial vaccines.

3. Allergic cleanliness.

   Cover feather pillows with plastic or silk dust-proof covers, discard tufted bead spreads, eliminate pets from the living quarters, eliminate the mold problem in the basement, protect the housewife or the working man from dusts insofar as possible (masks, filters for hot air ducts, sub-

History of Medicine In Minnesota

MEDICINE AND ITS PRACTITIONERS IN OLMSTED COUNTY PRIOR TO 1900

NORA H. GUTHREY
Rochester, Minnesota

(Continued from the April issue.)

Isaac Hall Orcutt (1847-1912), of Dodge County, Minnesota, was a practitioner of medicine in Byron, Olmsted County, from March, 1876, to January, 1883, and from 1893 until his death was well known in other parts of southern Minnesota. He commonly signed his name "I. H. Orcutt" and was known as "Dr. Hall Orcutt." He was a member of a family that for many decades has been established in Dodge and Olmsted Counties.

Born on June 7, 1847, near Westmoreland, Oneida County, New York, Isaac Hall Orcutt was the son of Isaac Orcutt and Julia A. Knapp Orcutt. By a previous marriage, about 1828, Isaac Orcutt had three children, Elizabeth Antoinette, George and Charles. By the second marriage, about 1835, there were eight children: Theodore de Martigne, Cola di Rienzi, Peter Ezra, Sheldon Read (for many years a carpenter in Dodge Center), Edward Henry, Levera Jane, Isaac Hall, and Alfred Stoddard (a Baptist preacher, who died in Luverne, Minnesota, in 1886). With his wife and children Isaac Orcutt in 1848 left New York for Ohio. From Ohio the group emigrated to Iowa in 1851, and from Iowa to Minnesota in 1855, settling on a farm in Milton Township, Dodge County; in 1863 they moved a few miles onto land in Concord Township. They traveled to Minnesota in two wagons drawn by oxen, and forded the Zumbro River at Rochester, when the settlement was represented by one log building, which served as inn, store, living quarters and blacksmith shop.

Isaac Hall Orcutt received his early education at local district schools; in 1866 he enrolled at the Groveland Seminary at Wasioja, and on completion of his course returned home to teach the school of his boyhood in Concord Township. It is said that in 1872 he began the study of medicine, doubtless under a local physician as preceptor, although record of such study does not remain. On March 21, 1876, he was graduated with the degree of doctor of medicine from the Chicago Medical College and in the same month began the practice of medicine in Byron. Dr. S. B. Kendall had been established there many years; Dr. W. H. Willson, of brief residence, came at the same time as Dr. Orcutt. In April, 1879, Dr. Orcutt went to the University of Pennsylvania for a course in natural sciences, and during the latter part of this absence Dr. William M. Dodd, a local boy of Kalmar Township, Olmsted County, a graduate of the Chicago Medical College (in March, 1880), carried his practice for a few months. Dr. Orcutt returned in June, 1880, with his degree of doctor of philosophy and resumed his practice; in March, 1882, he took into partnership Dr. Carlos R. Keyes, a graduate (1881) of the medical department of the University of Vermont, who had arrived in Byron a few weeks earlier. Dr. Orcutt, because of ill health, was then giving up his professional ride and restricting himself to office practice. In January, 1883, he retired to a farm between Dodge Center and West Concord.

Early in 1884, shortly after the death of his wife, Dr. Orcutt removed to Brookings, Brookings County, Dakota Territory, where he remained until 1893. For about two years a practicing physician (registered in the territory on April 28, 1886), in June, 1885, he was appointed to the faculty of the Dakota Agricultural College, at Brookings, as professor of natural sciences and curator of the college museum; there is record of his many field expeditions to collect botanical and geological specimens for the museum. His duties were comprehensive: He was college physician; from 1887 to 1891 he was professor of zoology, entomology and physiology; from 1888, in addition to his professorship, he was entomologist to the South Dakota Experiment Station at Brookings; from 1891 to late 1892, professor of zoology, geology and physiology. Notices have been observed of his lectures on health to the students, "giving them many valuable prescriptions"; on evolution; on entomology and the destruction of insects. In November, 1892, in the course of a political move within the college, it is said, Dr. Orcutt and five other professors were removed from the faculty, in the face of bitter protest of the entire student body, who sent a written vote of confidence to the deposed professors; many of the indignant students transferred to other colleges.

From early years a staunch Baptist, worker in the Sunday school, lecturer and preacher, Dr. Orcutt was outstandingly a prohibitionist and a scientific investigator of the ill effects of alcohol and tobacco on the human nervous system. For a few months after leaving the Dakota Agricultural College he continued his special studies at Brookings but early in 1893 removed to Owatonna, Steele County, Minnesota. There he brought out, in 1894, addressed to the public, his little book, *Microbes and Men,* the outgrowth of his special work, in the preparation of which he had been assisted by certain members of the faculty and the student body at Brookings, and by the Reverend S. A. McKay, of Owatonna. The frontispiece is a likeness of Dr. Orcutt, shown operating his sphygmograph, an instrument used in his many experiments and tests. In 1896 Dr. Orcutt removed to Northfield, Rice County, where he spent the remainder of his life, continuing his researches on alcohol and tobacco and lecturing on his findings before the Women's Christian Temperance Union and other interested groups in various towns of Minnesota and Iowa. For several years he served on the city school board of Northfield and also was engaged in overseeing properties in different parts of the state.

Isaac H. Orcutt was first married on May 23, 1876, to Emma A. Fairbanks, of Dodge Center, one of the two daughters of D. C. Fairbanks, farmer and grain and cattle buyer who had large holdings of land in the region of Dodge Center. Dr. and Mrs. Orcutt had one child, Allie Julia, named for Mrs. Orcutt's sister. Emma Fairbanks Orcutt died in Dodge Center on January 28, 1884, in her twenty-ninth year. In 1886 at Brookings, South Dakota, Dr. Orcutt was married to Carrie Ross, an undergraduate student at the college, a daughter of the Reverend Walter Ross, a Baptist minister in a near-by Dakota village; Mrs. Orcutt continued her college work and was graduated. Of this marriage there was one son, Walter Alfred.

Dr. I. H. Orcutt died at his home in Northfield on October 7, 1912, in his sixty-sixth year, of Bright's disease, survived by his wife, his daughter and his son; burial was in Oaklawn Cemetery, Northfield. Mrs. Orcutt died in Tampa, Florida, in 1928, where she had been making her home with her stepdaughter, the wife of

Captain George Stanley Smitzes. Mrs. Smitzes, a former high school teacher, is a graduate of Carleton College and of the Minneapolis School of Music, and has done postgraduate work at the state universities of Wisconsin and Minnesota. Captain Smitzes, veteran of World War I, served in World War II as a duty officer at the Moore General Hospital at Swannanoa, North Carolina. Walter Alfred Orcutt, graduate of Carleton College and teacher of natural sciences at various colleges and universities, died in 1917, within two weeks of graduation from the medical department of Western Reserve University; his son, William Hall Orcutt, of Chicago, born in 1914, a graduate of the University of Chicago and Rush Medical College (1938), during World War II was a captain in the Medical Corps of the Army of the United States, in the Pacific area. Dr. W. H. Orcutt (1946) has a son, Thomas Orcutt, and a daughter.

C. (O. ?) M. Palmer, said to have been a graduate of the Chicago Homeopathic Medical College, a physician and surgeon of nine years' experience, came to Rochester, Minnesota, about December 1, 1875, from St. Charles, Winona County, where he had been in practice four years. In Rochester he opened an office in the Leland Block on Broadway and boarded at the Cook House. The *Rochester Post* of December 25, 1875, announced that Dr. Palmer had removed to Blue Earth City, Minnesota. In the *History of Medicine in Winona County* (1940) it was stated that about 1882 a Dr. Palmer owned a farm in that county.

Martin Thompson Perrine (1817-1900), an eclectic practitioner, was the first resident physician (1855) in Rochester, Minnesota, and the second physician in Olmsted County. It is believed that Dr. Hector Galloway, at Oronoco, preceded him in the county by a few months.

Martin T. Perrine, son of William Perrine, who was a descendant of David Perrin (*David Perrin, The Huguenot, and His Descendants,* 1665-1910, by Howland D. Perrine), emigrated from Pennsylvania into Ohio probably in the eighteen forties. His daughter Minnie, only child of his first marriage, was born in Meadville, Pennsylvania, on July 15, 1840. According to records of the Perrine family, there were two daughters of a second marriage: Jennie, who was married to Ebenezer B. Park, of Boston, and who later lived at Osage Mission, Kansas; and Hattie, who twice married, first to Carlton Shepard and second to A. G. Wallace.

From Ohio Dr. Perrine came with his family to Rochester, Minnesota, arriving in May, 1855. A note appears that in 1858 his office was at the Bell and Fisher Drug store. Minnie Perrine was one of the first pupils, in the summer of 1856, at Rochester's first schoolhouse, a little log building across the Zumbro River in the eastern part of the settlement.

In the autumn of 1860, because of ill health, Dr. Perrine removed to Lake City, Wabasha County, where he entered business in a drug and variety store with his brother, Dr. L. C. Perrine, like himself an eclectic practitioner. It is doubtful that Dr. M. T. Perrine thereafter practiced medicine in Minnesota. In an undetermined year he removed from Lake City to Osage Mission, Kansas, to make his home with his daughter, Mrs. Park. He died at her home (the place of death is sometimes given Chanute, Kansas) on October 13, 1900.

Minnie Perrine was married in Lake City on October 9, 1860, to Franklin A. Poole, of Rochester. Mr. Poole, of English descent, was born in Troy, Geauga County, Ohio, in 1834, and came to Rochester, Minnesota, in 1857 from Dubuque, Iowa. Most of his adult life he was a merchant and druggist. In 1874 he went into business in Red Wing but in 1880 returned to Rochester, where for many years he was a druggist. Mr. and Mrs. Poole had one child, Alice, who died in infancy; Minnie Perrine Poole died in Rochester in December, 1908.

Robert McEwen Phelps (1858-1928), fifth appointee, in 1885, to the staff of the Second Minnesota Hospital for Insane, at Rochester, Olmsted County, gave forty years of service to the state, nearly twenty-eight years in Rochester and nearly thirteen years in St. Peter, a career of quiet influence and distinction.

Born at Ripon, Wisconsin, on March 15, 1858, Robert McEwen Phelps was the eldest of the three children of Abel McEwen Phelps and Pamelia Church Brockway Phelps, who were natives respectively of Norfolk, Connecticut, and Rochester, New York. Darius Phelps, father of Abel, a farmer as was the son, emigrated from Connecticut to Ohio in the early eighteen thirties and thence to Wisconsin.

Robert McE. Phelps received his early education in the public schools of Ripon and at Ripon College, from which he was graduated in 1880. Having decided on the study of medicine, in order to earn the money for his medical course he taught country school for one year after graduation from Ripon College and then worked with civil engineers for a railroad construction company in Wisconsin and Michigan, and also in Canada, on the first railroad built from Winnipeg to Swift Current. Thereafter he began his medical work under a preceptor, Dr. Rogers, of Ripon, and in 1883 entered Rush Medical College. He was graduated from Rush with the degree of doctor of medicine in March, 1885, and in the same month became Second Assistant Physician at the state hospital in Rochester, the first to hold that position; since 1881 the professional staff had consisted of the medical superintendent (Dr. J. E. Bowers) and one assistant physician.

Ethical, kindly and considerate in all relationships, Dr. Phelps won respect and esteem. He was a member of the Presbyterian Church, and a Republican. His recreational hobby from early years was amateur outdoor photography. Although a worker for the common good, he did not take part in civic affairs or hold public office. His deep interest in the welfare of the insane and his devotion to the art and science of psychiatric medicine filled and shaped his life; he kept abreast of advances in his field and for the good of the work applied his unusual literary talent and teaching ability.

His first four years in Rochester Dr. Phelps served as second assistant physician on the hospital staff. After the reorganization of the hospital in 1889 he became first assistant physician and the next year assistant superintendent. In 1889 there was established at the hospital a training school for attendants, in which he was influential, and in the autumn of 1890, when Dr. A. F. Kilbourne, the superintendent, approved the establishment of a training school for nurses at the hospital, Dr. Phelps became the moving spirit in the undertaking; the purpose was to train nurses for employment in the hospital and ultimately to supply nurses to other hospitals for insane. With the aid of Dr. Sara V. Linton and Dr. Nathan M. Baker, both of whom had joined the hospital staff in October, 1889, Dr. Phelps brought the training school to great success and usefulness, which continued many years. In November, 1890, the medical staff of the hospital, inspired and headed by Dr. Phelps, founded *The Bulletin,* the quarterly "psychiatric bulletin" of which M. K. Amdur wrote in 1941. Although short-lived, this publication was a noteworthy innovation and in it were presented many excellent papers by Dr. Phelps and his colleagues and by certain able psychiatrists from elsewhere in the state.

In the early nineties, in addition to other writings, for medical societies and official journals, Dr. Phelps published three graded text books (Rochester State Hospital Press) for use in the training school, books which had wide distribution in other state hospital training schools also: in 1893, *A Junior Text-Book on Nursing in Bodily and Mental Sickness;* in 1894, with his wife, Sara V. Linton Phelps, *A Senior Text-Book on Nursing in Bodily and Mental Diseases;* and in 1895, *A Text-Book on Nursing in Bodily and Mental Diseases.* During the Rochester period he contributed a weekly column, "The Saturday Philosopher," to the *Rochester Post.*

Throughout his career Dr. Phelps was active in medical societies: the Olmsted County Medical Society, from 1885 (its president, 1891); the Minnesota State Medical Society, from 1889; the Southern Minnesota Medical Association (a founder, 1892); and the American Medical Association. Among the special societies he was a member of the American Neurological Association and the American Medico-Psychological Association (once its president); the second of these groups, about 1921, became the American Psychiatric Association. After leaving Rochester for St. Peter, in 1912, Dr. Phelps was for many years active in the Nicollet-Le Sueur County Medical Society.

Robert McEwen Phelps and Sara Virginia Linton were married in Minneapolis on June 1, 1892. Dr. Linton Phelps continued as an assistant physician at the state hospital until her resignation in February, 1898. Three children were born to Dr. and Mrs. Phelps: Laura Linton, Isabella Brockway and Frances, the last of whom died in October, 1898, aged eleven months. In the spring of 1898 Dr. Linton Phelps contracted pulmonary tuberculosis, which caused her death five years later. Dr. Phelps because of his wife's illness was released from his hospital position for some two years and a half, beginning in June, 1899. After resumption of his work as assistant superintendent he remained at the Rochester State Hospital until September, 1912, when he became superintendent of the Minnesota Hospital for Insane, at St. Peter, succeeding Dr. H. A. Tomlinson. This superintendency Dr. Phelps filled ably until he resigned, because of failing health, on October 1, 1925. Thereafter he made his home with his daughter, Laura L. Phelps (Mrs. Charles Willard) Cross, of Faribault.

Dr. Robert McE. Phelps died at Faribault on October 27, 1928, after a terminal illness of four days, from chronic myocardial degeneration of long standing. His grave is beside that of his wife in Oakwood Cemetery, Rochester. Dr. Phelps was survived by his daughters, Mrs. Cross, of Faribault, and Isabella B. Phelps (Mrs. Floyd B.) Johnson, of St. Peter, and by seven grandchildren in the two families; by his sister, Isabella Phelps (Mrs. Frank E.) Gooding, of Rochester (died, 1944), and a niece, Isabella Gooding (since married to Parker D. Sanders, of Redwood Falls); and his brother, James B. Phelps, of Rochester. After the death of Mrs. Gooding, James B. Phelps made his home with Mr. and Mrs. Sanders; he died in Redwood Falls in March, 1945.

Sara Virginia Linton (Phelps) (1859-1903) was the tenth appointee, as an assistant physician, to the staff of the state hospital for insane at Rochester, Olmsted County, and on October 1, 1889, entered on eight years of exceptionally meritorious service.

Born on September 10, 1859, in Bucks County, Pennsylvania, Sara Virginia Linton was one of the five children of Joseph Linton and Christiana C. Beans Linton. It is of interest that of these children of a farm family in which the professional career had not been traditional, three became physicians. About 1860

Mr. and Mrs. Linton with their children emigrated from Pennsylvania to Wabash County, Indiana, it is said, and soon afterward to southern Minnesota, to settle near Kellogg, Wabasha County, in the days before the railroad had penetrated to that section. Within a few years they removed to Minneapolis, primarily to place the children in school. At a later period the father and two of the daughters filed on tracts of land in northwestern Minnesota.

Sara V. Linton obtained her early education in the common schools of Minneapolis, her academic courses at the University of Minnesota, and her medical training at the Woman's Medical College of Philadelphia. After receiving the degree of doctor of medicine, in 1889, she served for a few months as resident physician at the Northwestern Hospital, Minneapolis, before beginning her work with the insane.

The need for a department of gynecology at the state hospital in Rochester had become apparent by 1889 and inauguration and development of the work were placed in the hands of Dr. Linton. Throughout her service she was in charge of all gynecological procedures. Her "Report of the Gynaecological Department of Rochester State Hospital for 1895" in the *Northwestern Lancet* of April 15, 1896, gives an interesting résumé of the department's history and scope. In it she stated: "We are greatly indebted to the Drs. Mayo, of this city, for their kind assistance in helping us to extend our surgical work to include all of the more grave operations." Dr. Linton Phelps in those major procedures acted as surgical assistant. It was chiefly to meet the need for especially trained attendants in the new department of gynecology that the hospital training school for nurses was established in 1890. In foregoing notes on Dr. Robert McE. Phelps there was mentioned the able work of Dr. Linton in the school. There is record as well of her papers before special groups concerned with the care of the insane, her contributions to the hospital *Bulletin,* and her appearances before medical societies. In July, 1892, she was a founder of the Southern Minnesota Medical Association and in the same period a representative of the Olmsted County Women's Auxiliary to the World's Fair, heading the committee made up of herself, Mrs. W. J. Mayo and Mrs. Mark Olin, that had to do with all matters relating to health and public welfare.

After her marriage, on June 1, 1892, to Dr. Robert McE. Phelps, Dr. Linton Phelps continued her work at the hospital until February, 1898, when she resigned. As stated earlier, in the spring of 1898 she became ill with pulmonary tuberculosis. Changes of residence, to Wisconsin, to Walker, Minnesota, and Phoenix, Arizona, gave only temporary benefit, and on June 21, 1903, a few weeks after her return from Arizona Dr. Linton Phelps died in Rochester in her forty-fourth year. She was survived by her husband and by two little daughters.

Dr. Sara V. Linton Phelps has been described by those who knew her best as a slender woman of medium height and coloring, of special abilities, whose sympathetic and responsive spirit was apparent in her manner and facial expression. The esteem in which she was held in her profession was expressed not alone in tribute at her death but throughout her career by her immediate associates. In the words of Dr. A. F. Kilbourne, superintendent of the Rochester State Hospital in those years, "Her kindly care has brought relief to many a suffering woman, and much credit is due her for her painstaking treatment of these cases." And on her retirement, "Dr. Phelps was a most faithful and efficient officer whose soul was in her work."

The three physician members of the Linton family of Minneapolis were assistant physicians at the Rochester State Hospital. Dr. Linton Phelps was the first. Dr. Laura A. Linton (1853-1915), a graduate of the medical department of the University of Minnesota in 1900, in June of that year began her work in Rochester; her death occurred there in 1915. The late Dr. William B. Linton (1855-1942), a graduate of Jefferson Medical College, Philadelphia, in 1886, after practicing medicine in Minneapolis twenty-five years, spent fifteen years, beginning in September, 1912, in Rochester. Early in 1928 he returned to Minneapolis, where he carried on a private practice until his death.

Henry Stanley Plummer (1874-1936), distinguished medical scientist, was an associate of the Drs. Mayo in Rochester, Minnesota, from 1901 until his death. Although he was not a resident of Olmsted County before 1900, in the decades of which this article particularly treats, he is included, for reason, in the series of men who practiced in the county in that period: As an undergraduate medical student he spent part of his vacations at St. Mary's Hospital, Rochester, "pursuing the study of the practicing practitioner," as the local press phrased it; in the first two years of his professional life (1898-1900), in country practice, he was even more closely concerned with the practice of medicine in Olmsted County than he was with practice in Mower County, where he lived, and in Fillmore County, where he was born.

Born on March 3, 1874, in the village of Hamilton, Henry S. Plummer was one of the four children of Dr. Albert Plummer, of English descent, and Isabelle Steer Plummer, of Scotch-English parentage. Isabelle S. Plummer, daughter of Greenberry Steer, of Adrian, Michigan, was before her marriage a schoolteacher in various parts of Fillmore County, notably in Rushford and in Sumner Township. Dr. Albert Plummer (1840-1912), one of southern Minnesota's best trained and ablest physicians, was a native of Auburn, New Hampshire, who came to Fillmore County in 1869; a graduate of Bowdoin Medical College in 1867, he earlier was a student at the medical school of Dartmouth College, where his father, Dr. Nathan Plummer, a native of Londonderry, New Hampshire, had been a student in 1816.

Henry S. Plummer grew up in Hamilton, attended the village school, and in 1892 was graduated from high school at Spring Valley, near by. After taking two years of academic work at the University of Minnesota, he enrolled in the medical department of Northwestern University for a course of four years; it was the length of the course, then unusual in this country, and the wealth of clinical material available, that fixed his choice on Northwestern University. In 1898 he received the degree of doctor of medicine and returned home to begin medical practice with his father, who since 1893 had lived in Racine, Mower County; the practice of father and son extended widely into the three counties already mentioned.

From childhood Henry Plummer accompanied his father whenever possible on rounds in village and country and by his sixteenth year he had become a practical clinical assistant. In that year his interest was aroused by an unusual case of goiter in his father's practice, and thereafter, in premedical years, at medical school, and in practice, he gave special attention to the thyroid gland and its diseases. During his formal medical course he began a continuing study of the blood also. Late in 1900 Dr. William J. Mayo, called in consultation by Dr. Albert Plummer in a case of aleukemic leukemia (leukopenic leukemia) was impressed so profoundly by Dr. Henry S. Plummer's knowledge of the blood and by his scientific imagination that on returning to Rochester Dr. Mayo proposed to his brother Dr. Charles H. Mayo that they invite the young physician to Rochester for a discussion and if possible add him to their staff to bring the clinical laboratories up to date.

Dr. Plummer joined the staff of the Drs. Mayo early in 1901. He became the chief of the Division of Medicine of the Mayo Clinic and a professor of medicine of the Mayo Foundation for Medical Education and Research, Graduate School, University of Minnesota. During his thirty-five years in Rochester his work in diversified fields of medical science brought increased distinction to the clinic and merited prestige and high honor to himself. He was the author and the co-author of numerous scientific articles. His contributions to hematology, roentgenology, bronchoscopy, esophagoscopy, electrocardiography, and to knowledge of the physiology and pathology of the thyroid gland are known universally.

He was active in many scientific societies, which are listed in official biographical reference books. In 1935 Northwestern University conferred on him the degree of doctor of science (honoris causa). He was a Republican, a Mason, and a supporter of the Episcopal Church.

To Dr. Plummer, a master of mechanics and an inspired amateur architect, is due much of the efficiency of the Mayo Clinic buildings of 1912 and 1929. When each building took form it was the realization of a dream of the Drs. Mayo and their associates and the embodiment of Dr. Plummer's extraordiary mechanical genius. Perhaps most notable in the structure of 1929 are his numerous devices to facilitate intra-clinical communication and transfer of case records from floor to floor and from the clinic to the affiliated hospitals. In this building he gave new scope to the department of case records and statistics which he had initiated and directed, and he aided in increasing the efficiency of the library. Fittingly, a beautiful auditorium on the fourteenth floor bears his name. Dr. Plummer had a major part also in the design and construction of the Franklin Heating Station in Rochester, and because of his knowledge of physics and engineering he was sought as a consultant by the company that supplies Rochester and vicinity with natural gas.

Well called a genial philosopher and a profound thinker, Dr. Plummer was a man of keen and whimsical wit and humor, a scholar, a patron of the arts, literature and music, a horticulturist of standing; it was his expressed belief that the physician who renders his best service must have cultural interests as well as scientific knowledge. He traveled widely at home and abroad for study and for pleasure; he enjoyed motoring and, for some years in later life, cruising in his powered house boat on the Mississippi River.

Henry Stanley Plummer was married on October 4, 1904, to Daisy M. Berkman, a daughter of Dr. David M. Berkman and Gertrude Emily Mayo Berkman, of Rochester; Mrs. Berkman was the eldest child of Dr. and Mrs. William Worrall Mayo.

On December 31, 1936, in his sixty-third year, Dr. Plummer died from cerebral thrombosis at his home, Quarry Hill, in southwestern Rochester. Burial was in Oakwood Cemetery, Rochester. He was survived by his wife; a daughter, Gertrude Plummer (Mrs. James A.) Thomas, of Rochester; a son, Robert S. Plummer, of Los Angeles; and five grandchildren; and by his brother, Dr. William Albert Plummer, of Rochester.

Dr. W. A. Plummer (1883-1949) in 1910 joined the Drs. Mayo as an assistant in medicine. In 1949 he was the head of a section in medicine (since 1917) of the Mayo Clinic, and an associate professor of medicine, Mayo Foundation, Graduate School, University of Minnesota. (Dr. W. A. Plummer died at his home in Rochester on March 22, 1949, from heart disease, in his sixty-sixth year.)

In 1950 Mrs. Henry S. Plummer, a talented musician and a leading worker for civic and social welfare in Rochester, continued to make her home at Quarry Hill.

Harriet E. Preston (1840?-1929), unmarried, a graduate of the Woman's Medical College of Pennsylvania in 1868, came to Rochester, Minnesota, in the autumn of 1869 and there practiced medicine and surgery until the summer of 1873, when she removed to St. Paul. She was in active practice in St. Paul through 1888 when, it is believed, she returned to Pennsylvania.

Her office and residence in Rochester first were in the home of Mrs. G. Bisbee, one door north of the Northwestern Wagon and Carriage Works, on Broadway. Later she occupied an office over Poole and Geisinger's Drug Store. Liked as a woman, she had personal friends among the solid citizens of the community, and respected as a physician, she occasionally assisted Dr. W. W. Mayo and other local physicians of excellent standing in consultations and in operative procedures. She was a member of the Rochester Conversazione, successor to or an offshoot of the Olmsted County Medical Society in the early seventies; on one occasion she read before the group an essay on the voice in which she explained the production of the voice and the regulation of its tones. Dr. Preston was licensed in Minnesota on December 28, 1883, under the medical practice act of that year, receiving certificate No. 486 (R).

A few of Dr. Preston's concise writings are preserved in earliest issues of the *Northwestern Medical and Surgical Journal.* One, in 1873, is a report on the causes of diseases peculiar to women, presented before the state board of health and published by request of that board; in the report she stated, "I am satisfied that until the habits of women are modified, neither medical science nor surgical art can give them a satisfactory degree of health." Another, "Why Are These Things So?" is her comment on an article, "Medical Opinions," by Dr. Brewer Mattocks, of St. Paul, which had appeared some weeks earlier. Her theme was the reason why medical opinions rated so low in the scientific and intellectual market. Her plea was for the protection of the title of doctor of medicine from confusion with the titles assumed by numerous sects of "pathists" and for rejection of "the odious and misplaced term *allopath*." She asserted that the knowledge of the medical profession should not be a sealed book and pointed out the need for physicians to lecture before schools, lyceums and scientific associations: "We need more writers, more skilled physicians who can and will, like Oliver Wendell Holmes, give to the world medical facts and philosophy, in a form that will please the taste and instruct the understanding."

(To be continued in the June issue.)

President's Letter

PHYSICIANS AS CITIZENS

Despite the contributions that the medical profession has made to the progress of life and culture, physicians have only recently won their citizenship from the court of American public opinion. Through an honest, vigorous appeal to the people of this country, the profession has regained its aggregate right of free speech and is rapidly attaining a new position of leadership, not only in its preempted field of medical science, but in the economic, governmental and social structures of this nation.

The interest with which the public regards the idea of a doctor being a citizen, too, is an inverted criticism of our all-too-recent abstinence from the affairs of state and nation.

Cumulative and dangerous trends of economic thought catapulted us, ready or not, into active roles in the formation of opinion, policy and law. We have come to realize that the public's health cannot be guarded by medical attention alone, that sometimes an unscrupulous politician can be more threatening than a virus to American health standards and an infiltration of decadent thinking more disastrous than an epidemic.

The onslaught of socialistic propaganda has been countered and virtually inundated by a barrage of truth from the family doctors in every community.

This re-alignment with the public, this new confidence the profession has gained, has developed at a time when national unity is essential. It has been said that total war between two great nations possessing the atom bomb and the means to deliver it could destroy civilization as we know it. Physicians bring to the cause of justice and freedom, the training and ability to act in a crisis. Not easily stampeded by emergencies, physicians, it is hoped, will be able to maintain key civil defense positions, in preparation for a time we pray will never come.

The medical profession is coming of age and assuming its rightful responsibilities in a century of uncertainty and fear and, confronted with multiplying challenges, we can only choose to rise to these challenges as better doctors *and* better citizens.

OWEN H. WANGENSTEEN AN APPRECIATION

THIS issue of Minnesota Medicine is being dedicated to Dr. Owen H. Wangensteen in commemoration of the twentieth anniversary of the publication of his first work on the relief of intestinal obstruction by siphonage. We are happy to share in paying tribute to Doctor Wangensteen, and his accomplishments, with the Minnesota Academy of Medicine, which devoted its December meeting to honoring him, and the Saint Paul Surgical Society, which similarly recognized him at its meeting in January at which Dr. Alfred Blalock of Johns Hopkins Medical School was the guest speaker.

The journal has been fortunate in having two original articles written specially for this issue. The first is by Dr. I. S. Ravdin, John Rhea Barton professor of surgery; and Dr. William E. DeMuth, assistant instructor in surgery, University of Pennsylvania School of Medicine. The second is by Dr. Frederick A. Coller, professor of surgery at the University of Michigan, and his associate, Dr. Robert E. Lee Berry, a former student under Dr. Wangensteen. The address given by Dr. C. F. Dixon at the commemorative meeting of the Minnesota Academy of Medicine appropriately appears, too, in this issue.

The medical profession of Minnesota acclaims a man of renown. The present is the most appropriate time to express our appreciation of one of our members, Owen H. Wangensteen.

THE VARIETY CLUB HEART HOSPITAL

THE OPENING and dedication of the Variety Club Heart Hospital on the University of Minnesota campus on March 20, 1951, merits special recognition. It is the culmination of an idea which had its conception in 1945 in a conversation between the late Al Steffes, a theater owner in Minneapolis, himself a sufferer from heart disease, and Dr. Morse J. Shapiro, Associate Professor of Medicine and Pediatrics at the University of Minnesota. The idea was the building of a hospital to be devoted exclusively to the study and treatment of heart disease.

The idea was presented by Mr. Steffes to the Variety Club of the Northwest which had the vision and boldness to sponsor the project. This Variety Club is a so-called "tent" of the parent organization, the Variety Club International, which includes thirty-six "tents" located all over this country, and in Mexico, Canada and England. Membership includes almost anyone connected with the show business. The first club was organized in the late 1920's in Pittsburgh as an entirely social undertaking. In 1928 its character altered when it took over the care of a one-month-old baby foundling left in a Pittsburgh theater. From then on, the club took as its motto, "A little child shall lead them," and the international organization has carried on activities which have benefited thousands of children yearly.

The Variety Club of the Northwest (Tent No. 12) is fifteen years old. In its short existence, it has carried on a number of activities for the benefit of children, such as equipping of a projection room at Glen Lake Sanatorium and supplying a show each week to the patients; contributing to the Twin City Milk Fund; contributing $25,000 to aid refugees from Fascist tyranny. In 1944, it contributed $85,000 to Sister Kenny for polio sufferers.

In 1945 the Variety Club of the Northwest began raising funds for a heart hospital of seventy-eight beds. Aided by other civic organizations, the University of Minnesota, and largely by the public through its contributions of quarters and dimes in collection boxes in theaters all over the Northwest, the local club was able to present the University of Minnesota in September, 1948, with a check of $300,000 to begin construction. During the last three years, it has raised another $160,000 and has promised support to the amount of $25,000 yearly.

About one-third of the total cost of $1,500,000 was raised by the Variety Club. The Federal Government, through the agency of the Hill-Burton act, donated $600,000; the University, individuals and a bank loan of $100,000 made up the needed total.

The hospital, which is a four-story structure just below and attached to the University Medical Unit, is the last word in hospital construction. One story is devoted to adults, one to children with a school room and theater, and the fourth floor to research. The hospital is being operated by the medical school faculty.

The dedication dinner was held March 20 in the main ballroom of the Coffman Memorial Building. The Variety Club Heart Hospital was graciously presented to the University by Mr. Arthur W. Anderson, Chief Barker of the Variety Club of the Northwest and chairman of its Heart Committee. President Morrill accepted the gift for the University.

No trifling matter, too, is the fund of $500,000 raised by the American Legion and the Legion Auxiliary for the endowment of the American Legion Memorial Professorship to be devoted to research in heart disease as it affects children. Dr. Lewis Thomas is the first research professor. Another professorship established in the will of the late George S. Clark will be devoted to research in heart and allied diseases in the adult. Other generous grants for research in heart disease have been made by the Helen Hay Whitney Foundation, the Silas McClure Fund, the Minnesota Heart Association, the Alpha Phi Society, and the Minneapolis Chapter of the Society for the Preservation and Encouragement of Barber Shop Quartet Singing in America.

The Variety Club Heart Hospital is the culmination of the efforts of many individuals and organizations in response to a spark which started a widespread response in the hearts of many Minnesota citizens.

MEDICAL SCHOOLS AND THE AMA

SOME of the accusations cast at times at the organized profession show a woeful lack of knowledge of the facts.

The profession, that is, the AMA, has recently been accused of deliberately restricting the production of doctors in order to reduce competition and insure its financial well-being. How impossible this would be is brought out by Dr. Henderson, president of the AMA, in a recent article.* While physicians have been active as individuals and groups in the establishment of medical schools, the organized profession has never set a quota for the number of medical schools nor the number of medical students. If it had, such action would have had no authority, for medical schools are administered by medical faculties, university administrators and trustees.

Back in 1910, the publicity that followed the Simon Flexner survey of medical schools in the country resulted in the abolition of many poorly equipped medical schools and the consolidation of others. The AMA began rating medical schools that same year, and the quality of medical education has continuously improved since that date. As a result the medical care of the people has correspondingly been bettered. Now comes the criticism that the standards set by the Council on Medical Education and Hospitals for medical schools are so high that their cost of administration is prohibitive. The answer is that the standards set are limited to basic principles that reflect educational policies developed and practiced by leading medical schools and provide great leaway for individuality in the various schools. Actually the standards established are not prohibitive. Medical schools are at present being contemplated in New Jersey and in Florida.

As a matter of fact, the establishment and development of medical schools have been, by and large, co-operative undertakings between members of the profession and universities, as is only proper. The same co-operation should continue in the administration of medical schools and doubtless will.

SENATOR HUMPHREY'S BABIES

ACCORDING to the *Bulletin of the AMA* issued by the Washington office under date of April 5, 1951, Senator Humphrey of Minnesota introduced on March 30 a bill (S 1235) in the Senate "To extend to persons entitled to receive medical care by or through the Veterans Administration the right to elect, to receive Chiropractic treatment." The bill provides that the Chief Medical Director of the VA would be required to make services of qualified chiropractors available to veterans. Senator Magnuson prepared the bill at the request of the Director of the Veterans of Foreign Wars, and for reasons unknown to us the bill was presented by Senator Humphrey. This is another example of the kind of enlightened leadership which our Senator Humphrey has shown in the past.

---

*Henderson, Elmer L.: Medicine and medical education. M. Ann. District of Columbia, 20:181, (April) 1951.

Senator Humphrey has also submitted a bill (S 1245) "To establish a program of grants-in-aid to assist the States to provide maternity and infant care for the wives and infants of enlisted members of the Armed Forces during the present emergency." This is a plan similar to the EMIC of World War II. It differs, however, in that it provides benefits for all enlisted members of the Armed Forces instead of just the lowest four pay-grades. The matter of doctors' fees and hospital payments is left to the Administration of the Federal Security Agency. This legislation, if enacted, would cease to be effective at the close of the fiscal year in which the President declares an end to the national emergency.

This bill has had the backing of service organizations, both public and private. On March 28, 1951, the Minnesota State Legislature passed a resolution which was signed by the Governor requesting Congress to provide this additional remuneration for the families of men in service. Much as government-operated medical care and fees determined by the government are distasteful to the medical profession, it cannot be denied that enlisted personnel in the low-pay brackets cannot provide medical care for their wives and infants when their families increase. The administration of the EMIC program during World War II provided essentially for obstetrical care furnished by general practitioners. The fees allowed for obstetrical care were not what specialists, as a rule, charged. The obstetrical care provided, however, was good medical care. Snags in the operation of the law were encountered in the designation and selection of specialists as consultants. Probably leaving the selection of a consultant to the obstetrician in charge of the case would work most equitably in event this proposed bill is enacted, which it probably will. The general practitioner best knows the surgeon in his community whose opinion on a surgical or orthopedic problem is of value in consultation.

Julian F. Dubois, M.D., Secretary

Saint Paul Man Pleads Guilty to Abortion Charge

Re. State of Minnesota vs. John W. Foster

On April 2, 1951, John W. Foster, fifty-four years of age, 276 Ramsey Street, Saint Paul, Minnesota, entered a plea of guilty in the District Court of Ramsey County, to an information charging him with the crime of abortion. Foster had been arrested on March 6, 1951, following information received by the Minnesota State Board of Medical Examiners that an abortion had been performed on a twenty-five-year-old Saint Paul divorcee. Foster, upon being arraigned in the District Court, admitted that he had performed the abortion and received $50.00 for his services. Foster denied having performed any other abortions and claimed that his present difficulty was due to excessive drinking. Judge Arthur A. Stewart continued the case to April 16, for a pre-sentence investigation. On April 16, Foster was sentenced to a term of not to exceed four years in the State Reformatory at St. Cloud, the sentence being stayed and the defendant placed on probation.

Foster, who holds no license to practice any from of healing in the State of Minnesota, stated to the Court that he was born at Eagle Point, Wisconsin; that he completed the eighth grade in school and has lived in Saint Paul since 1928. Foster stated that he had been doing photographic work and had worked part time as a musician. Foster was defeated as a candidate for sheriff in the 1950 election.

TROUBLE MAKERS

Some people are inclined frequently to exaggerate in their statements. Some authors do so deliberately in order to start talk and, in the case of lay journals, increase sales. Such is an article entitled "Trouble in Our Hospitals" by Albert Deutsch which appeared recently in the *Woman's Home Companion.* In reply the secretaries of the American Hospital Association and the secretary of the American Medical Association sent the following telegram to the editor of the *Woman's Home Companion.* After all he didn't have to publish the article and a very little inquiry would have disclosed its misleading nature.

The telegram read as follows:

> We wish to protest strongly the tone of "Trouble in Our Hospitals" by Albert Deutsch in the current issue of *Woman's Home Companion.*
>
> While it is true there are some areas of disagreement between physicians and hospitals—just as there are in all human relationships—the author of this article has magnified these differences of opinion out of all proportion to the truth. His statement that "the AMA and the hospitals, which should be marching hand in hand toward better services for the sick, are locked in combat," is nothing short of sensationalism.
>
> The doctors and hospitals have always co-operated in efforts to deliver the best possible medical care and will continue to do so. Any differences are being ironed out peaceably around the conference table.
>
> George F. Lull, *Secretary and General Manager*

AMA JOURNAL MISSING? PAY 1950 DUES

Members of the American Medical Association who are not receiving their *AMA Journal,* should, according to word from the American Medical Association, see that they have paid their 1950 dues. Numerous inquiries about the situation throughout the country have brought this answer: when the 1950 dues were not paid by the end of the year, the doctor was entered in the category of delinquent membership in the AMA, and his name was automatically removed from the roster of members and from the list of those who receive the *Journal.*

The American Medical Association informed doctors that delinquent members will not be entered on the circulation list of the *Journal* until they have been reinstated to full membership, which means that they must pay BOTH their 1950 and 1951 dues. Direct word also states that "members who paid their 1950 dues on time (before the end of 1950) are in good standing and have until the end of 1951 to pay their 1951 dues. They will continue to receive the *Journal* during 1951 even if they cannot pay their 1951 dues until later this year."

After delinquent members have paid up both their 1950 and 1951 dues, they are reinstated and will begin receiving the *Journal* again. However, says the AMA, they should not expect to get the *Journal* the following week after they have written out their check. The process of reinstatement is often complicated and involves considerable office procedure. Prompt payment of dues will assure prompt delivery of the *Journal of the American Medical Association.*

BRITISH HEALTH SERVICE NEEDS DEATH "POTION"

Expressing the opinion of many forthright citizens of both England and America, the *Journal of the Oklahoma State Medical Association* recently suggested that the British Health Service, because of its countless shortcomings, be given a "lethal potion" to put it out of its misery. Quoting *Time* magazine's recent article on the "meatless muddles of the Socialist government," it tells of one British doctor's comment, which seems to summarize much that has been said of the system. The doctor said that, "The strain of living conditions is making people take sleeping tablets like a second vegetable."

The medical journal makes this comment on the "calamity of compulsion:"

> "Unfortunately, a sound sleep . . . under the National Health Service brings surcease of short duration with the inevitable return to hunger and hopelessness. Indeed this is poor compensation for such calamity.
>
> "All this is reminiscent of the long standing quip, 'the more good beefsteaks in Britain, the more brave soldiers.' According to current reports, even the harassed hungry doctors would like to take a pill and sleep off this ugly nightmare. How about a lethal potion for the National Health Act."

REPORT ISSUED ON VOLUNTARY INSURANCE

A report submitted to the subcommittee on health of the Senate committee on labor and welfare, recently gave a comprehensive picture of the operations in the health insurance field of the insurance business in the United States. According to *Eastern Underwriter,* the report "revealed the important role played by the insurance business in the spectacular progress made by voluntary health insurance in the last few years in helping the American people to meet the unpredictable costs of hospital and medical care." The report stated:

> "As of the end of 1949, protection provided by insurance companies represented 46 per cent of all hospitalization insurance carried by the American people at that time, three-fifths of all surgical expense protection, and one-third of all medical expense protection. In all, 41 per cent of the population were covered for

hospitalization insurance at the end of 1949, 25 per cent of the population for surgical expense, and 9 per cent for medical expense."

The report was based on the volume of business done by seven associations which represent over 200 companies, which, combined, account for over seven-eighths of the total health and accident business done by insurance companies in the United States.

A breakdown of figures showed detailed information on types of policies, benefit provisions, distribution of coverage by states, and samples of ownership by sex, age, occupation and income brackets. Some of the main points were:

> "Women represent nearly half of those covered under group hospital contracts written by insurance carriers on adults, 45 per cent of those under group surgical contracts, and 40 per cent of the number of adults under group medical insurance contracts. There is a substantial proportion of coverage among farmers and farm laborers, refuting the frequent assertion that health insurance is largely lacking in rural areas . . . A recent analysis of a group of newly-issued hospital expense policies indicates that approximately two-thirds of those obtaining this protection were in income brackets under $4,000 a year. Every state and the District of Columbia have substantial voluntary health insurance coverage . . ."

JOURNAL EXPRESSES LONG-RANGE VIEWPOINT

During this period of world affairs, when everyone seems to have a quick cure for the world's ills, stable ideas and views come from many sources—and those ideas are often left unnoticed. One such is a recent editorial in the *New England Journal of Medicine* which urges mankind to take the long view of things: "were some safe plateau of mutual understanding to be reached, a morass of unnecessary human misery might be avoided by everyone."

Continuing, the *Journal* says:

> "There is little doubt that the more ardent proponents of compulsory health insurance, so called, believe that modified socialism represents a political status that can be maintained, and that those citizens capable of the most intelligent leadership and imbued with the purest motives will automatically rise, like cream, to the top. Their opponents, on the other hand, despite their bitter vehemence, have no good reason for not examining with an open mind any proposals that are made and accepting those that can be said to represent progress toward a common goal.
>
> ". . . the difficulty for those who wish to be honest is not in deciding whether to follow a right course or a wrong one; it lies in liberating their minds from misconceptions and prejudices, so that they may more accurately decide where the greater good may lie. In doing this, they may realistically appreciate their opponents' reasons for holding to their own views."

The *Journal* wonders if man's apparent progress is only that of Sisyphus, the man who labored eternally with a stone toward the unattainable summit of the hill. "Man still must learn that true progress is not made through scientific achievement or the acquisition of knowledge, but through the wise application of their resources," the *Journal* declares.

Through this highly philosophical viewpoint comes the added meaning that not only medicine and all other professions, but the whole of mankind, must resolutely look itself in the face, rate itself with merits and demerits, and work out its own salvation.

The *Journal's* "far viewpoint" is concluded with this:

> "Salavation for the present race of mankind, if it is to come, will come not through the development of superior qualities, but through the proper use of the talents that man now possesses. It is not his to soar on wings attached with wax, but to stand erect on the good earth he now inhabits. The capacity is present. What is necessary is education, with emphasis on ethics, and a stirring of the loftier minds to assume that leadership without which the goal so nearly won is lost."

DEFENSE FUNDS FOR BETTER HEALTH?

Evidence that administration forces would try to include their pet schemes in defense budgeting, has again been noted by the *Wall Street Journal,* about which the paper quickly sets out to "let the people know." Quoting Truman as saying, "Our defense needs include, in many areas, more food, better education, and better health services," the *Journal* goes on:

> "No one can argue that more food, better education and better health are not desirable. But whenever such ideas come to the front they're inevitably coupled with the further idea that Uncle Sam is the one to put up the money to make them possible. Point Four is already underway as the current caboose on our billions-of-dollars foreign aid train. There's a good chance that it will become a global freighter all on its own, to carry our dollars around the world.
>
> "Every dollar that goes abroad this way is a dollar less for our own schools, our own streets and our many local services which have deteriorated under two decades of depression and war."

Minnesota Academy of Medicine

Meeting of November 8, 1950

The regular monthly meeting of the Minnesota Academy of Medicine was held at the Town and Country Club on Wednesday evening, November 8, 1950. Dinner was served at 7 o'clock and the meeting was called to order at 8:10 p.m. by the President, Dr. William A. Hanson.

There were forty-nine members and one guest present.

Minutes of the October meeting were read and approved.

There was some discussion regarding the new amendments to the Articles of Incorporation, but a motion was finally passed that those articles in question be reported back to the committee from which they came for rewording, and to be reported at a later meeting.

A motion was carried that the election of new members be deferred until the next regular election in April, 1951.

Dr. Theodore Sweetser read the following Memorial to Dr. A. E. Cardle, and a motion was carried that it be spread on the records of the Academy and a copy sent to the family.

ARCHIBALD E. CARDLE
1899-1950

The loss of Archibald Cardle in the airplane disaster of June 23, 1950, was a shock to Minneapolis and to the medical profession of Minnesota and the nation. His accomplishments were well known, as was the promise of his future.

We who knew him personally through the years realized what a loss he would be to his profession in its scientific efforts as well as in its relations to the rest of the population. But more than that, we realized that we had lost a patient, understanding, kindly colleague and friend.

Our knowledge of his life here makes us sure that he has attained a well-earned reward. But we know how sorely he is missed by his friends, and especially by his family, to whom we wish to express our heartfelt sympathy.

* * *

The scientific program followed.

Dr. Charles H. Slocumb, of Rochester, by invitation, gave the paper of the evening, entitled "Use of Cortisone and ACTH in Rheumatoid Arthritis." Lantern slides were shown.

The meeting was adjourned.

Wallace P. Ritchie, M.D., *Secretary*

Meeting of December 13, 1950

The regular monthly meeting of the Minnesota Academy of Medicine was held at the Town and Country Club on Wednesday evening, December 13, 1950. Dinner was served at 7 o'clock and the meeting was called to order at 8:15 p.m. by the President, Dr. William A. Hanson.

There were fifty-nine members and twenty-two guests present.

The following men were elected as officers for the year 1951:

President..........Dr. William Hengstler, Saint Paul
Vice President..............Dr. O. H. Wangensteen,
University of Minnesota
Secretary-Treasurer.........Dr. Wallace P. Ritchie,
Saint Paul (Re-elected)

This meeting was in "Special Commemoration of the Twentieth Anniversary of the First Publications on Intestinal Obstruction by Dr. Owen H. Wangensteen."

Dr. Claude F. Dixon, of Rochester, had been invited to give the paper of the evening. He chose as his subject, "Prognostic Factors in Colonic Malignancy" (See page 424).

The meeting was adjourned.

Wallace P. Ritchie, M.D., *Secretary*

WARNING STATEMENT TO BE INCLUDED IN AUREOMYCIN HYDROCHLORIDE, CHLORAMPHENICOL AND TERRAMYCIN HYDROCHLORIDE LABELING

The new antibiotics chloramphenicol, aureomycin hydrochloride and terramycin hydrochloride are highly bacteriostatic for many bacteria. Susceptible bacteria are suppressed and Monilia or other yeast-like organisms may replace the normal or abnormal bacterial flora. This most frequently occurs in the large bowel and is of little consequence. However, if this replacement occurs in a lung abscess, bronchiectatic cavity or in certain other lesions, a condition is created which may be unfavorable for the patient. Deaths from pulmonary moniliasis following therapy with the new antibiotics are known. Also instances of cutaneous moniliasis mistaken for sensitivity have been noted when the newer antibiotics were used in the treatment of disease.—*Council on Pharmacy and Chemistry.*

Some Peptic Ulcer Patients Do Better on Phosphaljel

Clinical experience confirms that certain types of difficult-to-manage ulcer show a more striking and lasting response to PHOSPHALJEL therapy than to other types of medication. Palatable PHOSPHALJEL is the peptic ulcer medication of choice in the following conditions:

- Marginal or jejunal ulcer following gastrojejunostomy.[1]
- Ulcer complicated by deficiency of pancreatic secretion or by diarrhea.[1,2,3]
- Prophylactically, after peptic ulcer surgery, and during seasonal recurrence.[3]

PHOSPHALJEL quickly relieves pain and promotes healing. Excellent for oral therapy, and for intragastric drip therapy.

✦ Reports and Announcements ✦

INTERNATIONAL ACADEMY OF PROCTOLOGY

The third annual convention of the International Academy of Proctology will be held at the Mayflower in Atlantic City, N. J., on June 7 and 8, 1951.

The scientific session of the program will feature the more recent developments in proctology through papers presented by outstanding speakers. These sessions will be open to members of the medical profession without charge.

The annual banquet of the Academy will take place on Thursday evening, June 7, 1951.

Further information concerning the convention and a copy of the program may be obtained by writing to the secretary, Dr. Alfred J. Cantor, International Academy of Proctology, 1819 Broadway, New York 23, N. Y.

INTERNATIONAL CONGRESS OF PHYSICAL MEDICINE (1952)

The International Congress of Physical Medicine will be held in London from July 14 to 19, 1952.

In accordance with the regulations of the International Federation of Physical Medicine, the meetings of the Congress will be reserved for matters dealing with the clinical, remedial, prophylactic and educational aspects of physical medicine and with the diagnostic and therapeutic methods employed in physical medicine and rehabilitation.

Technical, scientific and historical exhibitions also will be arranged.

In addition to the scientific program, a full program of social events and entertainment is being planned for the members and associate members. Arrangements for London and provincial visits of scientific and historical interest are also being made for the Congress week and the following week.

This is a preliminary notice, and full details will be announced later. Applications for the provincial program should be addressed to the Honorary Secretary, International Congress of Physical Medicine (1952), 45, Lincoln's Inn Fields, London, W.C.2.

AMERICAN PUBLIC HEALTH ASSOCIATION

The seventy-ninth annual meeting of the American Public Health Association, the eighteenth annual meeting of its western branch and the annual meetings of thirty-eight related organizations will be held simultaneously in San Francisco, October 29 to November 2. The combined meetings will bring together 5,000 health specialists from all parts of the Western Hemisphere. In San Francisco they will hear more than 400 authorities discuss modern public health practice in all its aspects and its vital relationship to national security and civilian defense.

CANCER MOTION PICTURES AVAILABLE

The Minnesota Division, American Cancer Society, has announced the availability of a new catalog of professional motion pictures related to cancer. This catalog, which lists the films available from the American Cancer Society, can be obtained from the Minnesota Division office.

Dr. Arthur H. Wells of Duluth, president of the Minnesota Division of the ACS, has pointed out that these professional films on cancer may be loaned to professional groups for showing in connection with meetings at which cancer may be discussed. These groups may be hospital staffs, medical schools, nursing schools, postgraduate courses in cancer, state and county medical meetings. There is no charge for the use of these films. Persons interested in obtaining a copy of the catalog may write to the Minnesota Division office of the American Cancer Society at 622 Commerce Building, Saint Paul 1.

MINNESOTA SOCIETY FOR CRIPPLED CHILDREN

The Minnesota Society for Crippled Children is a component part of the National Society for Crippled Children. In recent years the Society has been putting on an Easter Seal drive to raise funds to carry on the nationwide activities of this organization to help children and adults, who are crippled in one way or another, to live normal lives.

This year the Easter Seal drive in Minnesota fell behind other states. Some $80,000 more is needed to carry on the statewide activities desired. With the many requests for contributions, it is easy to let the small contribution to this society slide. Not necessarily a large contribution, but a large number of small contributions, will enable the society to carry out its work locally without curtailment.

Contributions may be sent to the Minnesota Society for Crippled Children and Adults, 1635 Hennepin Avenue, Minneapolis 3, Minnesota.

MINNESOTA SOCIETY OF MEDICAL TECHNOLOGISTS

The Minnesota Society of Medical Technologists will hold its annual convention on May 18 in the Minneapolis Auditorium and on May 19 at the Mayo Clinic Women's Club, Rochester.

Dr. Walter H. Seegers, professor of physiology and chairman of Wayne University College of Medicine, Detroit, Michigan, will be the guest speaker for the scientific meeting on the afternoon of May 18. He will discuss "Clotting of Blood" from 2:00 to 4:00 p.m. in Room 5, Minneapolis Auditorium.

At the morning session, from 10:30 to 12:00, in Room 5, Minneapolis Auditorium, Dr. Paul G. Frick and Miss

New LEVERAGE FOR CONTROL *of Certain Heart and Respiratory Disorders*

Dorsaphyllin now affords the therapeutic action of theophylline, *buffered by sodium glycinate to reduce gastric irritation.* With gastric acidity thus neutralized and precipitation of theophylline in the stomach prevented, the buffered drug is well tolerated in larger doses. In addition, having neither enteric nor sugar coating, Dorsaphyllin tablets disintegrate rapidly in the stomach and absorption begins immediately. By permitting the physician a freer hand in determining dosage, and by removing the obstacle to prompt therapeutic response, Dorsaphyllin brand of theophylline-sodium glycinate is providing new leverage in the management of such disorders as congestive heart failure, Cheyne-Stokes respiration, bronchial asthma, and status asthmaticus.

Tablets • Elixir • Suppositories
For children, palatable Elixir Dorsaphyllin is acceptable and well tolerated. For the hypersensitive, Dorsaphyllin Suppositories are available.

All interested are cordially invited to attend.

RAMSEY COUNTY TUBERCULOSIS AND HEALTH ASSOCIATION

At the annual meeting of the Ramsey County Tuberculosis and Health Association (formerly known as the Ramsey County Health Association), held April 25, 1951, at the Athletic Club in Saint Paul, the following officers were elected:

President—Edward A. Knapp
First Vice President—J. Richards Aurelius, M.D.
Second Vice President—John B. Burke
Treasurer—P. A. F. Smith
Assistant Treasurer—J. A. Caritzel
Executive Secretary—Ruth P. Junkin
Secretary—E. A. Meyerding, M.D.

The most impressive report of the activities of the year 1950 was the discovery of fifty-six unsuspected cases of tuberculosis as a result of the free chest x-ray survey that year. These were individuals who, had not their condition been detected, would now be disseminating the disease and would in some cases have escaped early detection, so important for the treatment of the patient.

SAINT PAUL SURGICAL SOCIETY

At a meeting of the Saint Paul Surgical Society at the Minnesota Club on March 21, Dr. Lyle Hay and Dr. Clarence Dennis were guest speakers. Dr. Hay, chief surgeon at Minneapolis Veterans Hospital, discussed "Perforated Duodenal Ulcers." Dr. Dennis, professor of surgery at the University of Minnesota, spoke on "Ulcerative Colitis."

WASHINGTON COUNTY SOCIETY

The regular meeting of the Washington County Medical Society was held in Stillwater on April 10. Guest speakers at the meeting were Dr. Vernon Smith and Dr. Albert F. Hayes, both of Saint Paul. Dr. Smith spoke on "Thrombo-embolic Phenomena," and Dr. Hayes discussed "Rupture of the Uterus."

The scientific program was followed by a presentation of motion pictures by Dr. Smith. The color pictures, showing a hunter's paradise as well as skiing adventures, were accompanied by rapid-fire comments by Dr. Smith.

In April the county society finished the publishing in county newspapers of the "educational posters" supplied by the Minnesota State Medical Association. The posters appeared 127 times.

WHERE ALCOHOLICS ACHIEVE INSPIRATION FOR RECOVERY

Where gracious living, a homelike atmosphere and understanding companionship contribute to successful rehabilitation.

200 acres on the shores of beautiful Lake Chisago

The methods of treatment used at the Hazelden Foundation are based on a true understanding of the problem of alcoholism. Among the founders of the nonprofit Hazelden Foundation are men who have recovered from alcoholism through the proved program of Alcoholics Anonymous and who know the problems of the alcoholic. All inquiries will be kept confidential.

In Memoriam

FERDINAND G. BENN

Dr. F. G. Benn, formerly of Minneapolis, died at LaMesa, California, March 12, 1951.

Dr. Benn was born at Amenia, North Dakota, September 14, 1878. His preliminary education was obtained at Castleton, North Dakota. He obtained a B.S. degree from The North Dakota College, Fargo, in 1898 and his M.D. degree from Hamline in 1903. Some twenty-one months of postgraduate study was taken in Chicago, New York and Vienna.

Dr. Benn practiced at Kulm, North Dakota, from 1903 to 1907 and again from 1908 to 1913. Since 1913 he had practiced in Minneapolis until he moved to LaMesa three years ago.

He was a member of the Hennepin County Medical Society, the Minnesota State Medical Association and the American Medical Association. He was a member of the staff of St. Barnabas Hospital and of Joppa lodge.

Dr. Benn is survived by a daughter, Mrs. Dorothy Schultz, Hopkins, and a son, Howard.

EDWIN JOHN GERALD BLOEMENDAAL

Doctor Bloemendaal of Lake Park, Minnesota, died early in April, 1951.

He was born in Orange City, Iowa, December 4, 1910. His preliminary education was obtained at Northwestern Classical Academy and Northwestern Junior College at Orange City, Iowa. He obtained his M.D. degree from the Iowa School of Medicine, Iowa City, Iowa, in 1936. He interned at Providence Hospital, Detroit, Michigan, and took postgraduate work at the University of Minnesota for six months. He served in the United States army for nearly nine years.

FELIX CHARLES DOLDER

Dr. F. C. Dolder, well-known practitioner of Eyota, Minnesota, died March 19, 1951 after a brief illness. He was seventy-six years of age.

Dr. Dolder was born in Chicago, March 30, 1874. He received his early schooling at Chicago English High School at Manual Training High School and at Armour Institute in Chicago. His medical training was obtained at Northwestern University from which he was graduated in 1903. He took additional training at the Postgraduate School in Chicago.

Dr. Dolder practiced at Joliet, Illinois, and at Hastings and St. Charles in Minnesota before locating at Eyota thirty-seven years ago.

On September 17, 1908, he was married to Emma Mary Luhmann at Dover. His wife passed away September 18, 1944. A son and daughter survive him.

Dr. Dolder was a member of the Olmsted-Houston-Fillmore-Dodge County Medical Society, the Minnesota State Medical Association and the American Medical Association. He was president of the Eyota Commercial Club in 1941 and a former mayor of Eyota. During more recent years he was well known for the elaborate Christmas decorations which he sponsored, in particular the customary huge Christmas bell which hung over the street near his home.

JOSEPH E. HEARD

Dr. Joseph E. Heard, former fellow in surgery of the Mayo Foundation, died at Shreveport, Louisiana, on January 19, 1951.

Dr. Heard was born at Brownsville, Tennessee, on December 15, 1888. He received the degree of M.D. in 1914 from Tulane University in New Orleans, and was an intern at the Charity Hospital in New Orleans from June, 1914, to June, 1916. He entered the Mayo Foundation as a fellow in surgery in July, 1916, and left the Mayo Foundation in July, 1922. During that time he served as a captain in the medical corps of the A.E.F. in France from August, 1917, to July, 1919. For four months he practiced at the Holt Clinic in Fort Smith, Arkansas, after which time he went to Shreveport, Louisiana, to practice surgery where he remained until the time of his death.

Doctor Heard was a diplomate of the American Board of Surgery, a fellow of the American College of Surgeons, a member of the American Medical Association, and a major in the Medical Reserve Corps of the United States Army.

CARL A. SCHERER

Dr. Carl A. Scherer of Duluth died February 12, 1951, at the age of sixty-eight.

Dr. Scherer was born in New Ulm, February 23, 1881. He attended Pillsbury Academy before graduating from the University of Michigan Medical School in 1907.

He practiced in Bolivia from 1909-12 and studied in Munich and Zurich in 1912-13. He was instructor in communicable diseases and diseases of children at the University of Minnesota from 1914 to 1916.

Dr. Scherer was associated with the Duluth Clinic for a number of years and was a former president of the St. Louis County Medical Society. He was health officer of St. Louis County from 1934 to 1944.

Death occurred at Maryville, California, where he was serving as county health officer.

GEORGE JACOB SCHOTTLER

Dr. George J. Schottler, a practitioner in the Dexter community for fifty-four years, died February 15, 1951. He was eighty years of age and had practiced for fifty-four years.

Doctor Schottler was born at Rockfield, Wisconsin, November 5, 1870. After attending district schools in

Head Pain as a Diagnostic Lead

Frequently the presence of head pain is overlooked. The physician learns of it only if he has made an effort to elicit the information. Since the etiology of the pain is the basis of rational management, the patient should be warned against taking medication before diagnosis is made.

Friedman[1] deplores the tendency to call any chronic recurring headache migraine. Careful history-taking and full physical and neurological examinations are essential for accurate diagnosis. A good starting point is a description of the headache — its character, laterality, frequency and intensity.[2]

The following chart gives briefly the primary diagnostic leads and treatment for the most common types of headache.

Etiology of Headache	Primary Diagnostic Data	Primary Therapy
Inflammatory e.g., Meningitis Abscess	Inflammation of intracranial structures; fever; leucocytosis; bacteriologic diag.	Specific: sulfonamides and antibiotics. Symptomatic: analgesics.
Tumor	Pain varies as spinal press. changes; skull X-ray.	Specific: surgery. Symptomatic, analgesics &/or hypnotics.
Sinusitis	Sinus congestion and infection; cloudy X-ray.	Specific: antibiotics and drainage. Symptomatic: analgesics.
Hypertensive	Hypertension present but pain not related to b.p. level; Dihydroergotamine. relieves pain.	General hypertension therapy; sedation. Symptomatic: analgesics.
Migraine & other vascular headaches	Headache: recurrent, intense, throbbing. No organic causation; migraine in family; patient: energetic, perfectionist. Visual prodromata; g-i. upset during headache.	To abort attack: oral ergotamine plus caffeine. General: adjustment to minimize nervous stress.

Data here tabulated is from: Wolf, G., Jr.,[3] and Friedman, A. P.[4]

Cecil[5] ranks vascular headaches, e.g., migraine and tension headaches, as the most commonly encountered of all. Because of their functional nature and usual recurrence at frequent intervals, they present a long-term therapeutic problem.

Therapy is conducted along two lines:

1) Psychotherapy to reduce the frequency of attacks. This consists mainly of advice on emotional adjustment to stressful situations and guidance toward a good balance between work and relaxation.

2) Treatment of the distressing attack to prevent the usual period of incapacitation. Many investigators have reported that ergotamine preparations are effective for relief of the acute migraine attack in 80% of cases.[1,6] The drug is given immediately when an attack is approaching and dosage adjusted to the needs of the individual.

GEORGE JACOB SCHOTTLER

(Continued from Page 500)

Wisconsin, he took a teacher's course in the North Indiana Normal School at Valparaiso, Indiana, graduating in 1892 with a B.S. degree and then attended Rush Medical School where he obtained his M.D. degree in 1896. He began practice at Dexter the same year. He took postgraduate work at Chicago Postgraduate School at a later date.

On March 27, 1947, Doctor Schottler shared honors with Dr. O. H. Hegge and the late Dr. A. E. Henslin at a dinner held in Austin in their honor. All three had each given more than fifty years of service to his community. Five years ago the county he served gave a party sponsored by the Dexter American Legion Auxiliary on the occasion of his seventy-fifth birthday.

Dr. Schottler was a member of the Mower County Medical Society, the Minnesota State Medical Association and the American Medical Association. He is survived by his wife; three sons, Dr. Max Schottler of Minneapolis, Kenneth of Duluth and Jesse of White Plains, New York; and a daughter, Mrs. Kathryn Remington of Chicago.

GLADYS TROMMALD SHERRILL

Dr. Gladys Trommald of Brainerd, who in 1950 married C. H. Sherrill, passed away March 1, 1951. She was forty-seven years of age.

Doctor Trommald was born July 21, 1903 in Brainerd, Minnesota. She was a graduate of Washington High School at Brainerd and obtained her M.D. degree from the University of Minnesota Medical School in 1930. She served in Northville, Michigan, and in Jacksonville, Illinois, as a psychiatrist before acting as assistant superintendent at the Anoka State Hospital.

Doctor Trommald is survived by her husband and one brother, Al Trommald, both of Brainerd.

ALBERT BERRY STUART

Dr. Albert B. Stuart, a physician of Cloquet, Minnesota, for the past thirty-two years, passed away March 21, 1951. He was sixty-eight years of age.

Dr. Stuart was born at Chariton, Iowa, September 1, 1882. He was graduated from the School of Medicine at the University of Nebraska in 1904. He served as an extern at the W.C.A. Hospital in Council Bluffs, Iowa.

Upon his return from service in the army overseas, he was associated with the Debarkation Hospital in New York and also served on the staff of Bellevue Hospital in New York before coming to Cloquet.

Dr. Stuart was a surgeon for the Northern Pacific Railway, served on the Cloquet Fire Commission, the Library Board and the Civic Center Board. He belonged to the local Masonic lodge and the Association for the Advancement of Science. He was a member of the St. Louis County Medical Society, the Minnesota State Medical Association and the American Medical Association.

He is survived by his wife, a son, Donald M. Stuart, of Indianapolis and a brother, Fred, of Joliet, Illinois.

Of General Interest

Dr. Elmer L. Henderson, president of the AMA, recently completed a tour of the United States military bases and operations in the Pacific area. He visited hospitals, talked with hundreds of Army, Navy and Air Force physicians, conferred with General MacArthur and flew over the battle lines in Korea. General MacArthur told Dr. Henderson that American wounded in the Korean war are getting the best medical care ever supplied soldiers anywhere.

* * *

Dr. John S. Siegel, Virginia, returned early in April from a three-week trip to California, during which he attended a meeting of the American Academy of General Practice at San Francisco.

* * *

A compilation of thirty scientific papers presented last fall at a University of Minnesota symposium on hypertension in honor of three Minnesota medical scientists has been published by the University of Minnesota Press.

The book, "Hypertension: A Symposium," was edited by **Dr. Elexious T. Bell**, professor emeritus of pathology at the University and one of the three men honored at the conference last fall. Tribute was also paid to **Dr. Benjamin J. Clawson**, professor emeritus of pathology, and **Dr. George E. Fahr**, professor emeritus of medicine.

Contributors to the book include physicians from every section of the United States and from three foreign countries. The book summarizes existing knowledge of hypertension, its causes and its treatment, and points the way to future research in the field.

* * *

Dr. Ludvig R. Lima and **Dr. William A. Owens** moved their offices into new quarters in the Arneson Drug Store Building in Montevideo during the middle of March. The new quarters for the clinic include offices for four physicians, examination rooms, waiting room, library, laboratory and a room for minor surgical operations.

* * *

Dr. Arthur M. Hall, Minneapolis, has accepted a call to serve as a missionary to South Africa for the Evangelical Lutheran Church.

* * *

Dr. Charles W. Rucker, Rochester, presented a talk on his trip to Guatemala at a meeting of the International Relations Club of Rochester Senior High School on April 4. His talk was illustrated with slides.

* * *

Among Minnesota physicians who registered at the fourteenth annual meeting of the **New Orleans Graduate Medical Assembly**, which was held March 5 to 8, were the following: Dr. D. L. Donovan, Albert Lea; Dr. H. C. Johnson, Thief River Falls; Dr. Francis McCarten, Stillwater; Dr. J. B. Nixon, Crosby; Dr. George S. Baker and Dr. Arlie R. Barnes, Rochester; Dr. Thomas J. Edward, Dr. James R. Ralph and Dr. Ramby C. Rasmussen, Saint Paul; Dr. Jay C. Davis, Dr. Russell Heim, Dr. John L. McKelvey, Dr. William H. Rucker, Dr. A. N. Russeth, and Dr. Albert V. Stoesser, all of Minneapolis.

* * *

Dr. B. T. Bottolfson, Moorhead, has moved his offices to the second story of the newly constructed Bottolfson Building in Moorhead. For the past five years his offices have been located in a Fargo building.

* * *

Dr. William O. McLane, formerly associated with the Bratrud Clinic at Thief River Falls, has taken over the practice of the late Dr. J. Lehman in Brainerd.

* * *

Dr. Richard L. Varco, associate professor of surgery at the University of Minnesota, was the principal speaker at a meeting of the Grand Forks, North Dakota, District Medical Society on March 21.

* * *

"Detection and Prevention of Cancer and Heart Disease" was the theme of a meeting held by the Twin Cities Lodge, American Federation of Government Employes, in Saint Paul on April 12. On the program **Dr. John F. Briggs**, Saint Paul, past president of the Minnesota Heart Association, spoke on "New Hope for Hearts."

* * *

Dr. Bernard S. Nauth, formerly of Winona, has opened offices for the practice of medicine in Bagley. Before moving to Bagley, he was associated with the Winona Clinic from 1945 to 1950.

* * *

Dr. John F. Pohl, Minneapolis, left for Europe during the first week of April to begin a three-month fellowship under the World Health Organization. He will study treatment, care, management and employment of crippled people in England, Germany, France and Austria.

* * *

Dr. D. L. Johnson, Little Falls, returned on April 3 from a two-week trip to California, where he attended a meeting of the American Academy of General Practice in San Francisco.

* * *

"An Atlas for the Clinical Use of the MMPI," a handbook for case histories for users of the Minnesota Multiphasic Personality Inventory, was published during the first week of April by the University of Minnesota Press. Authors of the volume are Professors Starke R. Hathaway and Paul E. Meehl. The book contains 968 case summaries, documenting a representative cross section of clinical experience with the MMPI, a test devised by Dr. Hathaway and the late Dr. J. C. McKinley.

Dr. and Mrs. F. L. Kling, Milaca, were named "Tourists of the Week" at Weslaco, Texas, while vacationing there late this last winter. For the past seven years they have spent part of the winter at the Weslaco Trailer Park, living in their trailer home. Dr. Kling has practiced in Milaca as a general physician and surgeon for forty years.

* * *

It was announced on March 22 that the partnership of **Dr. H. H. Holm** and **Dr. John W. Gridley** in Glencoe would be dissolved on April 1. Dr. Gridley, who became associated with Dr. Holm in 1946, planned to spend two months in postgraduate training and then, on June 1, become a partner in the Medical Arts Clinic at Watertown, South Dakota.

Dr. George N. Aagaard, assistant professor of medicine at the University of Minnesota, was principal speaker at a meeting of the Lutheran Student Sunday Evening Club at the University's Coffman Memorial Union on April 15. He spoke on the topic, "Are We Accentuating the Positive?"

* * *

A **"Doctors Exchange,"** designed to provide better medical service to the community, has been established in St. Cloud by the local physicians. All after-hour calls to physicians are centralized in one switchboard, which is open twenty-four hours a day. The exchange operator is informed at all times as to where physicians can be located, and if a specific physician is not immediately available, the exchange can suggest another who is convenient to the area from which the call originates.

* * *

Dr. J. C. Lannin, of Mabel, suffered a dislocated clavicle on March 27 when his car rolled backwards as he was alighting from it and severely twisted his shoulder.

* * *

Dr. H. Herman Young, Rochester, was a speaker at the accident prevention clinic held in Mankato on April 12. Dr. Young described his work in determining the causes of farm accidents and planning prevention programs.

* * *

Dr. C. W. Wasmund has returned to Red Wing and has become associated again with the Interstate Clinic. For the past eighteen months he has been working in the ophthalmology departments of several New York hospitals.

* * *

Dr. Christopher Graham, well-known Rochester physician, celebrated his ninety-fifth birthday in Rochester on April 3.

* * *

Dr. Charles W. Rogers, Winona, attended a meeting of the American Academy of Pediatrics in Cincinnati, Ohio, during the last week of March.

* * *

Dr. Robert A. Huseby, cancer research specialist at the University of Minnesota, discussed modern developments in cancer control at a one-day conference on cancer at St. Luke's Hospital, Duluth, on March 31. Sponsored by the Duluth District, American Cancer Society, the meeting was open to the public and featured discussions by a number of authorities on cancer.

* * *

Dr. Robert W. Hollenhorst, Rochester, participated in a spring graduate course at Gill Memorial Eye, Ear and Throat Hospital at Roanoke, Virginia, during the first week of April. He presented four papers entitled "Cortisone in the Treatment of Eye Disease," "The Eye in Hypertensive Cardiovascular Disease," "The Eye Manifestations of the Diffuse Collagenous Diseases" and "Optic Neuritis."

* * *

Dr. E. Mendelssohn Jones, chief of the surgical staff of Ancker Hospital, Saint Paul, was honored on April 21 at a testimonial dinner given by the members of the surgical staff at the Minnesota Club. Surgical residents and their wives were guests. Dr. Jones has been a member of the staff of the hospital since 1918 and has been chief of the surgical section for several years.

* * *

Dr. James M. Wagoner has opened offices for the practice of medicine in Harmony. A graduate of Indiana University School of Medicine, he served in the Army during World War II and later practiced in Indiana for two and one-half years.

Dr. Nathan K. Jensen has announced the opening of offices at 1935 Medical Arts Building, Minneapolis, for the practice of general and thoracic surgery.

* * *

The report of a committee on chronic and convalescent care in Saint Paul on March 21 indicated that the city needs three fifty-bed chronic-care hospital units and an additional public nursing home with 350 to 400 beds.

The committee, whose report was approved by the Saint Paul Area Health Council, was headed by **Dr. Ralph L. Olsen.** The committee estimated that there are 4,230 chronically ill persons in Saint Paul in a year, that 69 per cent of them are over sixty-five years of age, and that two-thirds of them need hospital or nursing-home care.

* * *

Dr. John W. Kirklin, Rochester, spoke on "Special Considerations in the Surgery of Infants and Children" at a meeting of the Jackson County Medical Society in Kansas City, Missouri, on March 27.

* * *

Dr. H. E. Coulter and **Dr. W. J. Hruza** moved their offices into their newly constructed office building in Madelia on March 24.

* * *

Dr. George W. Bagby moved from Cannon Falls to Rochester during the first week of April. He has begun a fellowship at the Mayo Foundation.

Speaking at a meeting of the Saint Paul Association of Officemen on March 27, **Dr. Gordon R. Kamman,** Saint Paul, discussed the Minnesota mental health program.

* * *

Among Minnesota physicians attending the annual meeting of the American Academy of General Practice in San Francisco late in March was **Dr. Harry B. Clark** of St. Cloud.

* * *

Minnesota's eighty-four rural counties spent more than $49,000 in **Christmas Seal** money last year to help finance the search for cases of tuberculosis, the Minnesota Public Health Association reported on March 26. Counties offering free chest x-rays to all residents last year included Goodhue, Mower, Kandiyohi, Lake of the Woods, Koochiching, Dakota, Rice, Grant, Waseca, Sherburne, Pope, Wabasha and Fillmore.

* * *

Dr. Kenneth D. Devine and **Dr. John R. Hill** were speakers at a meeting of the Chippewa County Medical Society in Chippewa Falls, Wisconsin, on April 10. Dr. Devine spoke on "Injuries of the Face and Facial Bones," and Dr. Hill discussed "Abscesses and Fistulas of the Anorectal Region."

* * *

Physicians of Fairmont and the surrounding area, all staff members of the Community Hospital, began a new policy in March of holding monthly staff conferences to correlate policies and keep informed on new therapeutic developments. Chief-of-staff for this year is Dr. W. H. Rowe of Fairmont.

BLUE CROSS AND BLUE SHIELD NEWS

Minnesota Blue Shield enrollment at the close of 1950 had risen from the 1949 total of 260,501 to 411,733. The 1950 Blue Shield payments on medical claims totaled $2,249,032.00 as compared to the 1949 total of $1,156,231.00. Nationally, Blue Shield covers over 18,000,000 people, Blue Cross over 40,000,000.

In view of the adjusted payments for some items in the schedule of payments to doctors, which were adopted during the latter part of 1949, and increased incidence, it was anticipated that the ratio of surgical-medical service expense to total earned income would be considerably greater than for the year, 1949, however, the percentage of surgical-medical service expense to total earned income for 1950 was 76.3 per cent compared with 72.8 per cent for 1949, or only a 3.5 per cent increase.

According to the latest report on all Blue Shield plans, as of September 30, 1950 these plans showed that an average of 80.94 per cent of income was used for medical and/or surgical expenses, 12.79 per cent was used for operating expenses, and 6.27 per cent for net income for reserves. The continued co-operation between Minnesota Blue Cross and Blue Shield has benefited both plans resulting in increased enrollment, decreased operating expenses, and in meeting the needs of the public who for the most part consider hospital and doctor bills as one item.

The present allowance of $25.00 for tonsillectomies performed on children under 13 years of age, has been increased effective May 1, 1951, to $30.00 for children who are eligible under the contract. This increase was based upon a study and recommendation by the Medical Advisory Committee, and was approved by the Board of Directors of Minnesota Medical Service, Inc., on March 28, 1951.

Last year for the first time we offered Blue Shield and Blue Cross contracts to individuals not eligible to enroll through groups. The underwriting of these individuals is more hazardous than group underwriting. Experience so far has been satisfactory. Continued studies are being made to determine whether or not individuals may be enrolled more often than under the present method.

The third non-group campaign for Blue Cross and Blue Shield opened on April 1 and closed April 21. To publicize the campaign, advertisements were placed in three metropolitan newspapers and other newspapers in the State. Radio spot announcements by Cedric Adams also helped to promote the non-group program. These advertisements and spot announcements are part of a promotional campaign planned for 1951. The total program includes 22 newspaper advertisements, and 20-second radio announcements by Cedric Adams for a period of 26 weeks, six nights a week, beginning April 2.

Books listed here become the property of the Ramsey, Hennepin and St. Louis County Medical Libraries when reviewed. Members, however, are urged to write reviews of any or every recent book which may be of interest to physicians.

Books Received for Review

IMMUNOLOGY. Third Edition. Noble Pierce Sherwood, Ph.D., M.D., F.A.C.P. Professor of Bacteriology, University of Kansas, and Pathologist to the Lawrence Memorial Hospital, Lawrence, Kansas. 731 pages. Illus. Price $8.00, cloth. St. Louis: C. V. Mosby Co., 1951.

HANDBOOK OF PEDIATRIC MEDICAL EMERGENCIES. Adolph G. DeSanctis, M.D., Professor of Pediatrics and Chairman of the Department of Pediatrics, Postgraduate Medical School, New York University-Bellevue Medical Center, Director of Pediatrics, University Hospital, New York University-Bellevue Medical Center, Director of Pediatrics, Gouverneur Hospital, New York City; and Charles Varga, M.D., Instructor in Pediatrics, Postgraduate Medical School, New York University-Bellevue Medical Center, Assistant Attending Pediatrician, University Hospital, New York University-Bellevue Medical Center, Assistant Visiting Pediatrician, Gouverner Hospital, New York City. 284 pages. Illus. Price $5.00, cloth. St. Louis: C. V. Mosby Co., 1951.

CHRONIC ULCERATIVE COLITIS. J. Arnold Bargen, M.D. Division of Medicine, Mayo Clinic, Rochester, Minnesota. 62 pages. Illus. Price $2.00, flexible binding. Springfield, Illinois: Charles C Thomas, 1951.

HYPERTENSION—A Symposium held at the University of Minnesota on September 18, 19 and 20, 1950, in honor of Elexious T. Bell, M.D., Benjamin J. Clawson, M.D., and George E. Fahr, M.D. Edited by E. T. Bell, M.D. 573 pages. Illus. Price $7.50, cloth. Minneapolis: Colwell Press, 1951.

SOME CONTEMPORARY THINKING ABOUT THE EXCEPTIONAL CHILD: Proceedings of a Special Conference on Education and the Exceptional Child of the Child Research Clinic of the Woods Schools, November, 1949. Langhorne, Pa.: Woods Schools, 1949. Reprints free on request.

This excellent pamphlet contains the record of the proceedings of a special conference on feebleminded, palsied, and epileptic children, as well as certain other specially handicapped children. It is concerned particularly with broad problems of management and possible community action in handling these conditions. For this reason it is of particular interest to this state in our attempts to improve our care of these conditions. It is brief, concentrated, and thorough in its coverage of these conditions.

MULTIPLE SCLEROSIS AND THE DEMYELINATING DISEASES: Proceedings of the Association for Research in Nervous and Mental Diseases, Dec. 10 and 11, 1948, New York. (Research Publication v. 28). 675 pages, illus. Price $12.00. Baltimore: Williams & Wilkins, 1950.

The Association for Research in Nervous and Mental Diseases has published its second volume on Multiple

Sclerosis and the Demyelinating Diseases. This, the twenty-eighth volume in a series of research publications, is a compilation and discussion of what is at present known about the demyelinating diseases. Over a quarter of a century has elapsed since multiple sclerosis was the subject of discussion at the annual meeting of the Association. In 1921, the Association first published the proceedings on multiple sclerosis in the second volume of the research publications.

A total of sixty-eight contributors representing all aspects of the demyelinating diseases have collaborated on their respective interest and knowledge in this disease. This volume brings to the clinician the latest in diagnosis, in treatment, and in probable etiology of multiple sclerosis, a neurologic disease familiar to all practitioners. The book is divided into eight major sections as follows: Part I.—Multiple Sclerosis, Historical Retrospect; Part II.—Ecology of Multiple Sclerosis; Part III.—Etiology of the Demyelinating Diseases; Part IV.—Blood Flow in Multiple Sclerosis; Part V.—Anatomic and Chemical Aspects of Multiple Sclerosis; Part VI.—Pathologic Aspects of the Demyelinating Diseases; Part VII.—Symptoms and Signs, Clinical Course and Diagnosis of Multiple Sclerosis; and Part VIII.—Current Treatment of Multiple Sclerosis.

The authors emphasize that the diagnosis of multiple sclerosis is not too difficult to make if one remains constantly aware of the fact that the crux of the diagnosis is the multiplicity or scattering of findings that defy localization to any single part of the central nervous system. It is also emphasized by the contributors that the diagnosis of multiple sclerosis is often made too glibly and surgical lesions that would account for the neurologic deficit are by-passed. Once the diagnosis of multiple sclerosis is made, investigation ceases to the detriment of the patient. Practically every practicing neurologist can recall a case wherein the diagnosis of multiple sclerosis was made and at a later date a brain or spinal cord tumor was removed. The chapter on the diagnosis of multiple sclerosis by Dr. Foster Kennedy emphasizes this point of the masquerade of multiple sclerosis.

This book will prove to be a most excellent reference to all who deal with neurologic disorders.

Z. R. M.

CORONARY ARTERY DISEASE. By Ernest P. Boas, M.D., Associate Physician, Mount Sinai Hospital, New York City, and Norman F. Boas, M.D. 399 pages. Illus. Price, $6.00. Chicago: The Year Book Publishers, Inc., 1949.

This monograph is a timely and valuable addition to cardiac literature. The chapters on physiology, anatomy and pathology are an introduction that the busy practitioner will skim over hurriedly. The clinical portion will provoke much thought.

The author wisely considers the myocardial infarction as but an episode in the course of coronary heart diseases. However, it so often is such a major factor that a further discussion of the ultimate prognosis after myocardial infarction would have been valuable.

The discussion of the relation of activity and trauma to coronary disease is particularly interesting. The author presents good evidence in support of his thesis that many myocardial infarctions are caused by occupational factors.

Anyone who sees heart patients will find much of value in this book.

David M. Craig, M.D.

VILLON, UN MAUVAIS GARÇON. Dr. Pierre Lôo. 119 pages. Price 350 frs., Paris: Vigot Freres, 23 rue de l'École de Medicine, 1950.

Here is another book about Villon, the "bad boy" among the poets. Hundreds of writers have discussed his "Petit Testament," his "Grand Testament," his Ballades" and other poems. Practically all acknowledge his genius, but there is not the same unanimity regarding his character. This attractive brochure is a psychological and medico-legal study of the self-confessed rascal.

Nearly all we know of Villon's life is set down in the frank and open revelations found in his verses. He was born in 1431. His father died when he was very young. His mother, pious, but poverty stricken, entrusted his education to a rather indulgent priest, Guillaume de Villon, chaplain of St. Benoit de Bétourné. The youngster played many tricks on his guardian and associated at night with all the bad boys in the neighborhood, which was just outside of Paris. With funds provided by the priest, he matriculated at the Sorbonne, where he acquired a smattering of classical knowledge. Eventually, he was made a "Master of Arts" and was licensed as a

"clerk." Meanwhile, he had lived the night life of many Paris students of the day, gambling, drinking and making boon companions, of doubtful reputation, of both sexes. He was often without funds and in poor health. Dr Lôo does not believe he had tuberculosis. Returned to St. Benoit, he became involved in various robberies and even in a homicide which may have been in self defense.

His verses, sad and pessimistic as many of them are, seem still to be regarded as very beautiful, and the poet himself as worthy of affection. Rabelais, Daudier and Swinburne loved him, emphasizing his virtues and minimizing his faults. Robert Louis Stevenson was less lenient.

Doctor Lôo takes a realistic view of the man, and attributes most of his acknowledged faults to the times and the environment. He concludes that his evident mental disease was not a psychosis but a psychoneurotic state. He had a brilliant intellect and no lack of emotions but not even an attenuated sense of moral responsibility. He was a "déséquilibré," an unbalanced personality. With a Christian background, a belief in a merciful God and a love for France, he still was powerless to act accordingly. Doctor Lôo raises the question, "Is not perhaps a great poet more useful to the world than an honest man?"

Arthur T. Laird, M.D.

A DICTIONARY OF THE FUNGI. G. C. Ainsworth, B.Sc., Ph.D., University College, Exeter, Devon; G. R. Bisby, M.A., Ph.D., Commonwealth Mycological Institute, Kew, Surrey. 447 pages. Illus. Price $3.00, cloth. Kew, Surrey. The Commonwealth Mycological Institute, 1950.

Though titled a dictionary, this volume takes on a broader responsibility than a mere definition of mycological terms. The dictionary proper lists alphabetically the names of the various classes, orders, families and genera of fungi found throughout the world; also descriptive terms, as well as a number of helpful tables and more extended discussions of certain subjects of which the following are typical: Agaricaceae, antibiotics, bacteria, classification, collection and preservation of fungi, history of mycology, etc. Unfortunately for the physician or other casual inquirer in the realm of fungi, the data listed under the average term (the name of the genus, for example), are so condensed and terse as to be somewhat baffling until the system of reference is ferreted out piece by piece. For the true mycologist (to which rarefied genus the reviewer decidedly does not belong), the terseness may well be an advantage rather than a disadvantage.

While a key to the families of fungi is appended, also a systematic arrangement of the genera of Myxothallophyta (slime thallophytes) and Eumycetes (fungi), no attempt is made to list individual species of fungi, numbering some 37,500. Neither is any key given for identification of species of fungi—an endeavor which of itself would require a volume much larger than the present one.

It is obvious that the book is written for the mycological student, the scientist, rather than the hobbyist, the amateur collector of mushrooms or the chance wanderer among the fungi. For the professional inquirer, it is a scholarly work and should be an excellent reference.

Reno W. Backus, M.D.

THE PRACTICE OF MEDICINE. Jonathan Campbell Meakins, C.B.E., M.D., LL.D., D.Sc., Formerly Professor of Medicine and Director of the Department of Medicine, McGill University; Formerly Physician-in-Chief, Royal Victoria Hospital, Montreal; formerly Professor of Therapeutics and Clinical Medicine, University of Edinburgh; Fellow of the Royal Society of Edinburgh; Fellow of the Royal Society of Canada; Fellow of the Royal College of Physicians, London; Fellow of the Royal College of Physicians, Edinburgh; Honorary Fellow of the Royal College of Surgeons, Edinburgh; Fellow of the Royal College of Physicians, Canada; Fellow of the American College of Physicians; Honorary Fellow of the Royal Society of Medicine. 1558 Pages with 518 Illustrations, 50 in color. Price $13.50. St. Louis: The C. V. Mosby Company, 1950.

The fifth edition of *The Practice of Medicine* is a large and cumbersome book. Only from a material aspect, however, as the reading is clear and certainly not cumbersome. The new advances in medicine, as in metabolism, the antibiotics, and chemotherapy, are included in the volume in a very readable manner. The section on psychosomatic medicine is especially interesting and useful to the physician who deals in internal medicine.

As stated in a review of the previous edition, the color plates used by the various contributors are outstanding in their teaching value.

In general, I would highly recommend this book. It should make up one of the units in every doctor's library.

Joseph M. Ryan, M.D.

PRACTICAL POINTS IN ALLERGY

(Continued from Page 445)

stitute tank type vacuum sweepers for the "beater" type.) Patients with chronic respiratory infection, nasal allergy, or bronchial asthma should be cautioned to keep sleeping room windows closed in inclement weather.

4. Emotional problems.
   They must be dealt with. Bring them up for discussion and resolve them if possible.

In dealing with the asthmatic patient, probably more than with any other group, we must keep trying, alter the program as necessary, and be ready to deal with new factors as they may enter the picture. For this dejected and discouraged group of patients we must remain cheerful and radiate confidence to our patient. If you, as his physician, quit trying and give up, what about the patient?

Chronic Eczema

Chronic eczema is another of the more difficult problems encountered in the allergy clinic. Our experience has taught us that such factors as faulty nutrition, disorders of carbohydrate metabolism, thyroid dysfunction, superimposed skin infection and over-medication of the skin are just as important as are allergic factors. Protein tests may be helpful, and again they may be non-contributory. Chocolate, eggs, wheat products, milk and sensitivity to pollens may be important items to consider. The management of such skin conditions are left primarily to the dermatologist.

Summary

1. Allergic patients may be encountered in any practice, regardless of our individual interests in medicine. We, as physicians, should be prepared with a basic plan of procedure when such individuals enter our office. Several treatment plans which have been helpful in this allergy clinic are presented.

2. A thorough and accurate history is the most important means we have of arriving at a correct analysis of such problems. Protein tests are helpful, but their importance should not be overemphasized.

"...*in the minds of men*..."

In treating the disorders that exist in the minds of men, psychiatric nursing plays a vital role. Proper care can be given patients only by properly trained psychiatric nurses.

In view of the present shortage of such trained nurses, and the desperate need for them, the Glenwood Hills Hospitals School of Nursing, Neurology and Psychiatry is appealing to you physicians for aid in solving this problem.

By sending us the name of a promising nursing candidate in your community—a girl aged seventeen or over, with a high school education—you will be doing your part to alleviate this critical nursing shortage.

Our one-year course in psychiatric nursing is tuition-free. Our graduates have an excellent professional career before them.

Please send the name of a potential nursing recruit to

Sound example of three-dimensional structure is LACTUM, Mead's evaporated whole milk–Dextri-Maltose® formula.

1. Sixteen per cent of Lactum's calories are supplied by *milk protein*—providing a generous amount for growth and development.
2. *Milk fat* contributes 34% of the calories.
3. *Carbohydrates* supply 50% of the calories—to provide generously for energy, permit proper metabolism of fat, and spare protein for tissue-building functions.

Authoritative pediatric recommendations support this caloric distribution. And cow's milk and Dextri-Maltose formulas with these approximate proportions have been successfully used in infant feeding for forty years.

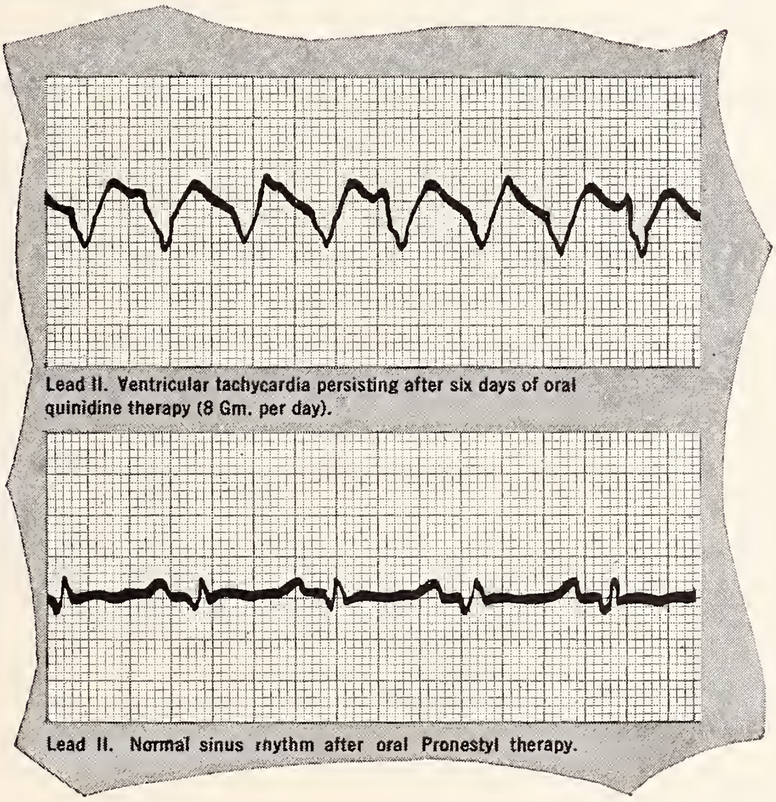
a new drug . . .

for the treatment of ventricular arrhythmias

PRONESTYL *Hydrochloride*

Squibb Procaine Amide Hydrochloride



Lead II. Ventricular tachycardia persisting after six days of oral quinidine therapy (8 Gm. per day).

Lead II. Normal sinus rhythm after oral Pronestyl therapy.

Oral administration of Pronestyl in doses of 3-6 grams per day, for periods of time varying from 2 days to 3 months, produced no toxic effects as evidenced by studies of blood count, urine, liver function, blood pressure, and electrocardiogram. Pronestyl may be given intravenously with relative safety.

PRONESTYL IS A TRADEMARK OF E. R. SQUIBB & SONS

Pronestyl Hydrochloride Capsules, 0.25 Gm., bottles of 100 and 1000.
Pronestyl Hydrochloride Solution, 100 mg. per cc., 10 cc. vials.

For detailed information on dosage and administration, write for literature or ask your Squibb Professional Service Representative.

SQUIBB MANUFACTURING CHEMISTS TO THE MEDICAL PROFESSION SINCE 1858

ESSENTIALS OF AN ANTIBIOT

rapid absorption and distribution in maternal body fluids and tissues

Rapid absorption and distribution following oral administration suggest the use of Terramycin as an effective aid in combating puerperal infection. Therapeutic serum and tissue levels are quickly achieved, to control many infectious processes which may complicate pregnancy or labor. In pyelitis of pregnancy caused by a sensitive organism, for example, patients respond to Terramycin "...very promptly..." with "...a prompt drop in temperature, disappearance of pyuria and bacilluria, and symptomatic relief."[1]

CRYSTALLINE

Terra

broad antimicrobial spectrum

The antimicrobial spectrum of Terramycin encompasses pathogens responsible for many of the infections which may complicate pregnancy, e.g., streptococci, staphylococci, pneumococci, coliform bacteria, gonococci, and the viral-like causative agent in lymphogranuloma venereum.

rapid passage through the placental membrane

Terramycin readily traverses the placental membrane and becomes available in the fetal circulation to combat or prevent fetal infection, said to be a frequent cause of premature labor or abortion. In both mother and fetus "very prompt response" with Terramycin treatment has been recorded in pneumococcic pneumonia complicating pregnancy.[2]

HYDROCHLORIDE

ACCEPTED COUNCIL ON PHARMACY AND CHEMISTRY AMERICAN MEDICAL ASSOCIATION

The growing literature continues to stress:

1. The broad-spectrum activity of Terramycin
against organisms in the bacterial and rickettsial as well as several protozoan groups.

2. The promptness of response to Terramycin
in acute and chronic infections involving a wide range of organs, systems and tissues.

Crystalline Terramycin Hydrochloride is available as:

Capsules, 250 mg., bottles of 16 and 100; 100 mg., bottles of 25 and 100; 50 mg., bottles of 25 and 100.
Elixir (formerly Terrabon), 1.5 Gm. with 1 fl. oz. of diluent.
Intravenous, 10 cc. vial, 250 mg.; 20 cc. vial, 500 mg.

WANGENSTEEN SUCTION SYSTEM

by PHELAN

DESCRIPTION Height 21 inches, diameter 15 inches. Weight approximately 30 pounds. Mounted on four Bassick casters.

The tank is hollow with a crowned head and inverted bottom. It is made of 16 gauge steel of welded and brazed construction throughout and finished in hammered aluminum lacquer, baked for durability.

On the top of the tank is a vacuum gauge reading in inches of mercury, a needle valve, a pump handle and a handle for moving the piece. IV tubing connects the tank to the drainage bottle.

SOME OF ITS USES

Decompression and drainage of stomach by connecting to nasal tube.

Gastrostomy decompression by connecting to gastrostomy tube.

Enterostomy decompression by connecting to enterostomy tube.

Aseptic decompression of bowel.

Withdrawal of blood in exchange transfusions.

ADVANTAGES

Silent in operation.

Safe for patient—no water used—patient's stomach cannot be flooded.

Impossible to develop positive pressure or excessive negative pressure.

Complete—requires no electrical or power connections.

A device requiring a minimum of attention—a time saver.

Easily portable—requires a minimum of space.

Economical—saving bottle replacements, etc.

Explosion proof.

In case drainage bottle is allowed to overflow, suction to the patient is not interrupted.

Hundreds of these units in use and not one request for service or replacement of parts.

The $64,000,000,000 Question Is

Why do Professional people think their accounts are different from commercial accounts? Our answer is "No Difference."

Your patients have the same jobs
Your patients have the same income
Your patients have the same debts
Your patients have the same habits
Your patients have the same excuses

Commercial enterprises collect systematically, leaving the Professional class holding the bag.

The wheel that squeaks gets the grease.

Psychological warfare commences immediately upon your forwarding your accounts for credit control and collection service.

The services offered by the Professional Credit Protective Bureau "Division of I. C. System" have been adopted by over 50 trade associations extending from coast to coast.

After twelve years in the liquidation of professional accounts receivable, you will be able to benefit by our experience.

Not A Collection Agency — All Monies Paid Directly To You

COST less than collection through your own efforts and in most cases one-half of usual collection agency fees.

Operates with extreme courtesy and goes to the fullest extent the law permits.

Our contention is that this is the outstanding credit control and professional collection service in the United States.

- NO ASSIGNMENT OF ACCOUNTS
- RETAINS PATIENTS' GOOD WILL

When you want money bad—we offer a service that is good!

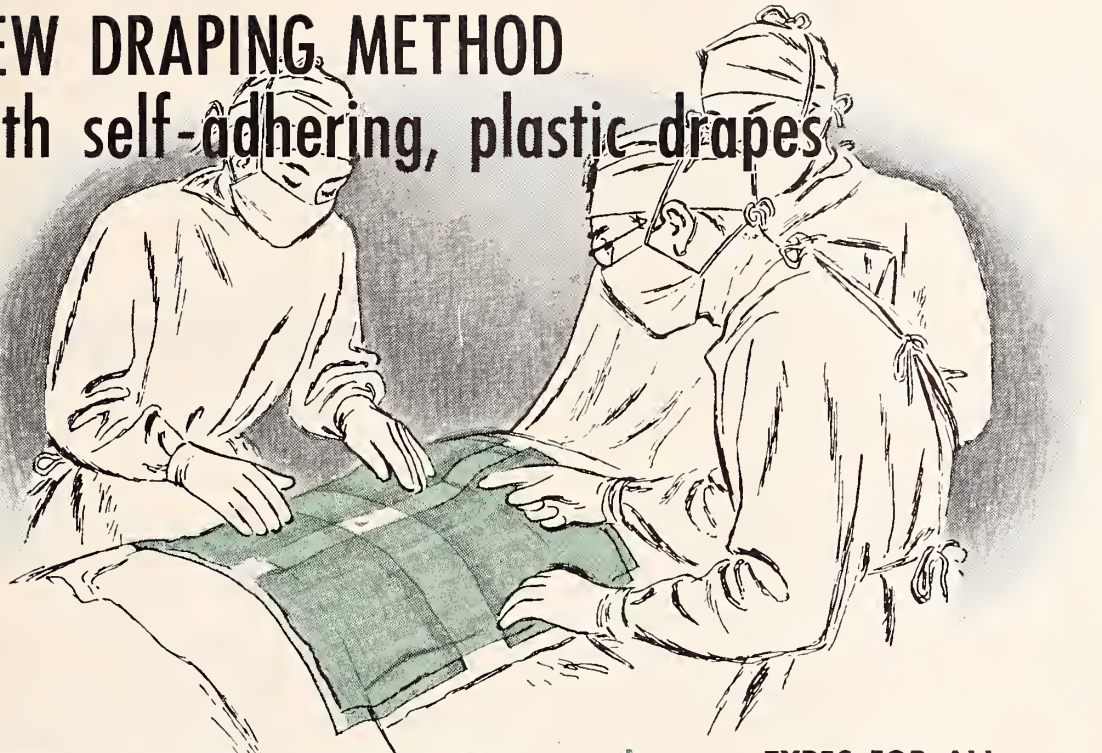
NEW DRAPING METHOD
with self-adhering, plastic drapes



HERE'S THE NEWEST DEVELOPMENT IN SURGICAL DRAPING!

"SCOTCH" Surgical Drapes are made of soft green plastic film with a border of special adhesive. The waterproof plastic film forms an impermeable barrier against contamination through absorption, while the adhesive edge holds the drapes firmly in place and seals off the flow of fluids beyond operative site.

Sterile and ready to use

These new drapes are pre-sterilized—need no further autoclaving. By a new, exclusive packaging method the drapes may be removed from their aluminum foil container and applied without danger of contamination.

Convenient and fast

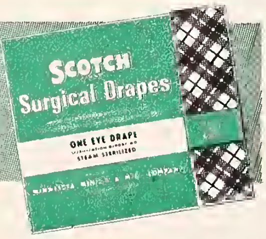
Easy to apply even to irregular areas, "SCOTCH" Surgical Drapes are non-toxic and unaffected by surgical solutions. Disposable after use, they eliminate the need for laundering and sterilizing facilities.

TYPES FOR ALL OPERATIVE TECHNIQUES

- Style No. 1100 Drapes measure 8″ by 15¾″, have adhesive along one end. (Two in each package.)
- Style No. 1200 Drapes, 16″ by 16″, have an adhesive-bordered circular center opening 2½″ in diameter.
- Style No. 1300 Drapes, 32″ by 50″, have an adhesive-bordered 3″ by 2″ elliptical opening in the center.
- Style No. 1400 Drapes are 26″ by 15¾″, have adhesive along one end.

ORDER a supply from your surgical dealer today. Write Dept. MIM651, Minnesota Mining & Mfg. Co., St. Paul 6, Minn., for additional literature.

SCOTCH BRAND **Surgical Drapes**



Made in U.S.A. by Minnesota Mining & Mfg. Co., St. Paul 6, Minn., also makers of more than 100 varieties of pressure-sensitive adhesive tape sold under the trade-mark "SCOTCH."

A FACTUAL REPORT ON SUCARYL®

(CYCLAMATE, ABBOTT)

the new heat-stable, non-caloric sweetener

What it is: Sucaryl is a new non-caloric sweetening agent useful in the preparation of sugar-restricted diets for diabetic and obese patients. Its function is to supply the desired sweetness without adding carbohydrate, thereby making it easier for patients to adhere to a strict dietary regimen. Sucaryl is heat-stable, which permits its use in boiling, baking, canning and freezing processes without loss of sweetness. As a result, Sucaryl can be used in a great variety of foods. It has a sugar-like sweetness and leaves no bitter or metallic aftertaste in ordinary use.

How supplied: Now in calcium as well as sodium forms. Handy-to-carry Sucaryl Sodium tablets, eighth-gram, effervescent, grooved, in bottles of 100 and 1000; Sucaryl Sodium Sweetening Solution, liquid form convenient for household use, in 4-fluidounce bottles; and Sucaryl Calcium Sweetening Solution, newly developed non-sodium form for low-salt diets, in 4-fluidounce bottles.

Recommended usage: Recommended daily limit for adults, 12 tablets or about 1½ teaspoonfuls of solution. Since the tablets contain sodium bicarbonate as a disintegrator, somewhat lower sodium diets are possible with the sodium solution than with the tablets. Sodium content per tablet is 21.64 mg., while an equivalent amount of sodium solution contains 14.25 mg.

Patients on strict low-salt diets, however, should use the calcium solution. The calcium form has a lower bitter taste threshold, noticeable in some foods when the proportion reaches 0.5 percent, compared to about 0.8 percent for the sodium form. Both forms are equally good in ordinary use.

New, enlarged recipe booklet is now available. Contains canning and freezing instructions, plus new recipes for cooked and baked foods sweetened with Sucaryl. Recipes save 15 percent or more in calories. To obtain copies for your patients, see your Abbott representative, or simply write "Sucaryl Recipe Booklets," specifying the number you need, on your prescription blank and mail to Abbott Laboratories, North Chicago, Illinois. Professional literature and a sample bottle of Sucaryl Sodium tablets also will be sent on request.

New Non-fat Dry Milk Solids Overcome Several Causes of Important Dietary Deficiencies

Milk products supply three fourths of the calcium so commonly deficient in the diets of young and old. In addition milk products provide almost half the riboflavin, one fourth the protein plus other important elements of the American diet. It is disturbing, then, to learn that the per capita consumption of dairy foods last year was the lowest in over a quarter of a century. Americans averaged less than *one half quart* of milk per day!

One important reason is the rising cost of dairy products. Another is the general desire to reduce the caloric content of adult diets.

New, improved non-fat dry milk solids overcome these and other obstacles to better dietary habits.

1. DIETARY NEEDS— Being non-fat, this milk food is excellent for low calory diets. It provides the calcium and other important minerals, high quality protein, riboflavin, and the B vitamins found in whole milk. Certain non-fat dry milk solids now also are fortified with 400 units of vitamin D per reconstituted quart.

2. COST— Grocery stores in your state now have packages of improved non-fat dry milk solids that provide the equivalent of 3 quarts of fluid milk for less than 10 cents a quart.

3. FLAVOR — Unlike previous milk powders, the new non-fat dry milk solids have the same flavor as fresh milk. In blindfold tests people say they can't tell the difference.

4. CONVENIENCE — New non-fat dry milk powder now can be reconstituted into fluid milk more easily and completely. It is packaged in separate envelopes, each of which makes a quart of milk without measuring or extra mixing equipment. This food keeps in a small space without refrigeration.

Now more delicious and convenient for drinking, new non-fat dry milk solids also can be recommended to enrich many recipes. Very easy to use, they double the milk food value and increase the flavor of soups, cereals, meat and vegetable dishes.

Growing Children
need 5 to 7 quarts of milk a week. Many foods and drinks can be milk enriched this new way.

Most Adults
don't get the 5 quarts of milk they need each week. Here is a tasty milk food without fat.

Pregnant Women and Nursing Mothers
can enrich their diets this convenient way to get the needed 7 to 11 quarts of milk weekly.

When Convenience is the Keynote

DEXTROGEN®

For Your Infant Patients

Merely Dilute

Ready to use and in liquid form, Dextrogen is a concentrated infant formula, made from whole milk modified with dextrins, maltose, and dextrose. In addition, it is fortified with iron to compensate for the deficiency of this mineral in milk. Diluted with 1½ parts of boiled water,* it yields a mixture containing proteins, fats and carbohydrates in proportions eminently suited to infant feeding. In this dilution it supplies 20 calories per ounce.

Then Feed

The higher protein content of normally diluted Dextrogen—2.2% instead of 1.5% as found in mother's milk—satisfies every known protein need of the rapidly growing infant. Its lower fat content makes for better tolerability and improved digestibility.

Dextrogen serves well whenever artificial feeding is indicated, and is particularly valuable when convenience in formula preparation is desirable.

---

*Applicable third week and thereafter; 1:3 for first week, 1:2 for second week.

COMBINATIONS OF ANTIBIOTICS IN THE TREATMENT OF INFECTIOUS DISEASES

WILLIAM E. WELLMAN, M.D.
Rochester, Minnesota

THE synergistic and antagonistic effects of one drug on another have been a subject of investigation and study for many years. With the advent of the antibiotics, similar investigation was undertaken. This paper concerns itself with the synergistic and antagonistic effects of combinations of the various antibiotics in common use today: penicillin, dihydrostreptomycin, aureomycin, chloramphenicol and terramycin.

Although combinations of penicillin and dihydrostreptomycin had been used more or less empirically by clinicians, Klein and Kimmelman in 1947 published data involving *in vitro* studies which demonstrated a synergistic effect between these two drugs. They found that, in combination, these two substances left a residuum of viable resistant bacteria. However, these remaining bacteria were unable to multiply, the development of resistant forms thus being controlled. That this effect was indeed synergistic rather than merely additive was clearly demonstrated by Nichols in 1948. In the same year Spicer and Blitz found that although penicillin is bactericidal, it leaves a residuum of viable organisms which are destroyed when dihydrostreptomycin is used in combination with penicillin. Robbins,[14] and Robbins and Tompsett,[15] published two reports in 1949 in which they found a synergistic action of these two drugs for enterococci and Streptococcus viridans. In the same year Heilman showed that the most effective method of treating brucellosis in mice was with a combination of aureomycin and dihydrostreptomycin.

In 1950 Jawetz and his colleagues[1,8,10] found that combinations of penicillin and dihydrostreptomycin are synergistic because they increase the bactericidal rate. They also demonstrated an antagonism between penicillin and aureomycin or chloramphenicol. In other words, penicillin alone was more effective than when combined with either aureomycin or chloramphenicol. It had been established by Hobby and associates that penicillin is most effective when bacteria are multiplying actively. This being so, Jawetz and his co-workers have postulated that aureomycin and chloramphenicol are antagonistic to penicillin because they are bacteriostatic, thus inhibiting bacterial multiplication. These same authors found that dihydrostreptomycin paired with aureomycin and chloramphenicol, and aureomycin paired with chloramphenicol, showed no enhancing or antagonistic effect. Jawetz and Speck, studying streptococcal infections in mice, found that 20 per cent of the mice died after administration of penicillin or chloramphenicol alone, whereas 60 per cent died after administration of combinations of chloramphenicol and penicillin. Hunter,[7] working with bacteria *in vitro,* confirmed the antagonistic effects of combinations of penicillin and aureomycin. He further noted that the combination of aureomycin and dihydrostreptomycin was effective against certain bacteria.

Herrell, Heilman and I presented data concerning the development of strains of Escherichia coli and Aerobacter aerogenes resistant to terramycin, aureomycin, chloramphenicol and dihydro-

---

From the Division of Medicine, Mayo Clinic, Rochester, Minnesota.

Read at the annual meeting of the Minnesota State Medical Association, Rochester, Minnesota, April 30, 1951.

streptomycin. As shown in Table I, strains made resistant to terramycin, to aureomycin and to chloramphenicol regularly showed an increased resistance to all three of these antibiotics but not to dihydrostreptomycin. Strains made resistant to dihydrostreptomycin did not exhibit an increased resistance to the other three antibiotics. Not infrequently the induction of resistance to terramycin, aureomycin or chloramphenicol resulted in an increase in sensitivity to dihydrostreptomycin. Conversely, an increase in resistance to dihydrostreptomycin sometimes was accompanied by an increase in sensitivity to terramycin, aureomycin or chloramphenicol.

TABLE I. INDUCED RESISTANCE TO TERRAMYCIN*

Organism and Strain	Made Resistant to:	Sensitivity in Micrograms per Milliliter			
		Terramycin	Aureomycin	Chloramphenicol	Streptomycin

	Chloramphenicol	50	25	200	6.25
Aerobacter aerogenes 1,155	0	3.12	3.12	6.25	6.25
	Chloramphenicol	6.25	12.5	200	3.12
Escherichia coli 1,120	0	3.12	3.12	12.5	12.5
	Streptomycin	1.56	1.56	6.25	200
Aerobacter aerogenes 1,158	0	1.56	1.56	3.12	12.5
	Streptomycin	1.56	0.78	1.56	200

*From Herrell, W. E.; Heilman, F. R., and Wellman, W. E.: Some bacteriologic, pharmacologic, and clinical observations on terramycin. Ann. New York Acad. Sc., 53:448-458 (Sept. 15) 1950.

A few strains of Streptococcus faecalis and Micrococcus pyogenes have been made resistant to terramycin or to aureomycin. With these organisms the development of resistance to one of the drugs has caused a substantial increase in resistance to the other, but not to chloramphenicol or to dihydrostreptomycin.

I have reviewed these laboratory reports in an attempt to acquaint you with the facts supporting the clinical use of combinations of the various antibiotics. At present, data concerning the clinical use of combination therapy are still somewhat limited. There are, however, a few diseases in which the use of combined therapy seems justified.

The first disease falling in this category is brucellosis. In 1950 Herrell and Barber reported data on thirty-five patients in whom brucellosis was treated with a combination of aureomycin and dihydrostreptomycin. Twenty-five of these patients had culturally proved brucellosis. In ten there was unmistakable evidence of brucellosis but no positive cultures were obtained. These thirty-five patients were all treated with a combination of aureomycin and dihydrostreptomycin and were followed, from three to nineteen months, with only one symptomatic relapse and no bacteriologic relapses. The dosage schedule was as follows: Patients with systemic or bacteremic brucellosis were given 3 gm. of aureomycin and 2 gm. of dihydrostreptomycin daily for twelve to fourteen days, while patients with localized lesions including those of the urinary tract, the skeletal system or the lymph nodes received 3 gm. of aureomycin and 1 gm. of dihydrostreptomycin daily for twenty-eight days. Aureomycin was administered in doses of 750 mg. every six hours; and 1 or 0.5 gm. of dihydrostreptomycin, depending on the duration of treatment, was given in the morning and evening. That this method of treatment is extremely satisfactory is evident from the fact that, of these thirty-five patients, all recovered and there were no bacteriologic relapses. It is my opinion that to date this is the method of choice in the treatment of brucellosis.

Combined therapy has also been found to be of value in the treatment of subacute bacterial endocarditis. The usual patient with endocarditis due to the various groups of streptococci responds well to penicillin alone. However, there are about 3 to 10 per cent of these patients in whom the infection is caused by a highly resistant organism. These resistant organisms are classed as enterococci, of which Streptococcus faecalis is one of the commonest. In 1947 Hunter[6] treated one patient who had subacute bacterial endocarditis due to Streptococcus faecalis with a combination of penicillin and dihydrostreptomycin. That this patient recovered was unusual, since very rarely had penicillin alone been successful.

However, in 1949, Robbins and Tompsett[15] reported data on six patients with enterococcal bacteremia, five of whom had subacute bacterial endocarditis. Two of these patients received treatment only terminally, but four completed a course of from four to eight weeks and recovered. These four patients were followed from six to twelve months and none relapsed. The same authors[16] in March, 1951, reported the results of combinations of penicillin and dihydrostreptomycin in nine patients with enterococcal endocarditis. Two patients received only a short course of therapy before death and were not considered as having had adequate therapeutic trials. Of the remaining seven patients, five recovered and two died. The recommended dosage schedule is 6,000,000 units of penicillin and 2 gm. of dihydrostreptomycin daily for twenty-eight to forty-two days. Five hundred thousand units of crystalline penicillin were given intramuscularly every two hours together with 0.5 gm. of dihydrostreptomycin four times daily.

Loewe and his colleagues also in March, 1951, reported data on four patients with enterococcal endocarditis who received both penicillin and dihydrostreptomycin. Two of these recovered and two died. The treatment period was from two to three weeks, and these patients received from 5,000,000 to 20,000,000 units of penicillin daily together with 1 to 2 gm. of dihydrostreptomycin. These authors recommended 10,000,000 units of penicillin daily given by the intravenous method. In their opinion dihydrostreptomycin should be added to the treatment only if penicillin alone fails to control the infection.

It is my opinion that at present the treatment of choice in enterococcal subacute bacterial endocarditis is a combination of penicillin and dihydrostreptomycin. The optimal dose of these two substances remains to be determined. I am also convinced that, when one is dealing with subacute bacterial endocarditis due to an unknown organism, combinations of these two drugs should be used.

Three other diseases which deserve mention in this regard are bacteremia, peritonitis and meningitis. When the organism causing these infections is known, one can usually determine the antibiotic of choice with little difficulty. However, if the organism producing these infections is unknown, the recommended treatment consists of combinations of aureomycin or terramycin with dihydrostreptomycin. Aureomycin and terramycin are preferable to penicillin, since they have a wider antibacterial spectrum. In the treatment of meningitis it is well to remember that terramycin does not diffuse into the cerebrospinal fluid. The suggested dose is 3 gm. of aureomycin or terramycin daily combined with 2 gm. of dihydrostreptomycin. If treatment is to be given for more than two weeks, the daily dose of dihydrostreptomycin should be 1 gm. Further clinical trials are necessary before final statements can be made concerning the optimal dose and the combinations of choice.

Conclusions

The data concerning combined therapy are confusing and in some cases contradictory. Furthermore, in many instances the clinical significance of the laboratory data is yet to be established. However, a few facts of significance seem clear.

First, a definite synergism between penicillin and dihydrostreptomycin has been established. The reason for this synergism is still in question. One group of investigators feels that the residuum of viable bacteria left by penicillin is destroyed by dihydrostreptomycin, while another group is of the opinion that dihydrostreptomycin added to penicillin controls the development of resistant forms by inhibiting their ability to multiply. Another hypothesis explaining this synergism is based on the fact that combinations of these drugs substantially increase the bactericidal rate.

Second, there appears to be an antagonistic effect between penicillin and aureomycin or chloramphenicol. In other words, penicillin is more effective alone than in combination with either aureomycin or chloramphenicol. This is thought to be due to the fact that aureomycin and chloramphenicol are bacteriostatic, thus inhibiting the multiplication of the bacteria. This slows the action of penicillin, which is known to be most effective against bacteria in the rapidly growing phase.

Third, certain bacteria made resistant to aureomycin, to terramycin and to chloramphenicol showed an increased resistance to all three of these antibiotics but not to dihydrostreptomycin. Bacteria made resistant to dihydrostreptomycin did not show an increased resistance to the other three antibiotics. These findings are consistent with the fact that combinations of aureomycin and dihydrostreptomycin are effective in the treatment of brucellosis. These facts suggest that combinations of aureomycin or terramycin with dihydrostreptomycin would be effective in the treatment of peritonitis, meningitis and bacteremia when the organism causing these infections is unknown.

Fourth, a combination of aureomycin and dihydrostreptomycin represents the treatment of choice in brucellosis.

Fifth, the recommended treatment in subacute bacterial endocarditis due to enterococci consists of a combination of penicillin and dihydrostreptomycin. This combination is also preferable when the etiologic agent is unknown.

DDT INSECTICIDE SAFE IF WISELY USED

DDT, an essentially poisonous material, can be used with a wide margin of safety if it is wisely used, reports the Committee on Pesticides of the Council on Pharmacy and Chemistry of the American Medical Association in the current (March 10) *Journal of the AMA.*

DDT—in the form of powders, solutions, emulsions and aerosols—has been widely used in recent years to control plant and animal pests as well as disease-carrying insects with a great deal of success.

The committee, which recently reviewed literature and case reports on the substance, points out that the poisonous effect of DDT on living organisms decreases with the increase in complexity of the organism. Thus insects, a lower type of organism, are destroyed by the substance while human beings and the higher types of animals are "not likely" to be harmed.

Some human deaths, however, have been caused by DDT and therefore "certain precautions must be observed to guard against its potential toxic properties," they added.

A warning was given to farmers to be careful when applying DDT to food or fodder crops. DDT applied directly to the edible portions of a plant may result in poisoning. It should not be used on dairy cattle or ani-

THE EFFECT OF CORTISONE IN GLOMERULONEPHRITIS AND THE NEPHROPATHY OF DISSEMINATED LUPUS ERYTHEMATOSUS

W. E. JACOBSON, M.D., B. I. HELLER, M.D., and J. F. HAMMARSTEN, M.D.
Minneapolis, Minnesota

ON the basis of theoretical considerations and in view of some encouraging preliminary reports, it was considered advisable to study carefully the effects of cortisone on renal function in patients with various types of renal disease. The data presented in this report are derived from the investigation of four patients in various phases of glomerulonephritis and two patients with the nephropathy of disseminated lupus erythematosus.

Results

The first patient was a thirty-year-old man with acute glomerulonephritis. The values for the renal plasma flow, glomerular filtration rate, filtration fraction, hematuria, albuminuria, and blood urea nitrogen are recorded in Table I. The control observations demonstrate abnormalities characteristic of this disease and include a marked reduction of the glomerular filtration rate, prominent hematuria and albuminuria, and an elevation of the blood urea nitrogen. This patient was given cortisone acetate, 200 mg. daily, for twenty-three days. During the period of hormone administration there was an increase in the renal plasma flow and a delayed increase in the rate of glomerular filtration. The degree of hematuria, albuminuria, and azotemia was not altered. After cortisone was discontinued, the renal plasma flow and glomerular filtration returned to values below the control levels and the other measurements remained essentially unchanged. Five months after the completion of this study the patient died of severe renal insufficiency. At the time of the autopsy the kidneys showed the findings of subacute glomerulonephritis.

The second patient was a fifty-eight-year-old man who developed acute glomerulonephritis following an acute streptococcic pneumonia (Table II). At the time that the studies were initiated the patient was improving spontaneously. However, the control observations still revealed marked renal dysfunction, hematuria, albuminuria, and mild azotemia. This patient received 100 mg. cortisone daily for twenty-one days, and after a two-week period of observation, he was given a second course of cortisone, 200 mg. daily, for one week. During these studies there was a definite rise in both the renal plasma flow and the rate of glomerular filtration. Hematuria, albuminuria, and the blood urea nitrogen showed only minimal changes from the control levels. Six weeks after the second period of drug administration the routine urinalysis was negative except for a trace of albumin. The Addis count, however, still demonstrated hematuria and cylindruria.

The third patient (Table III) was a thirty-year-old man with subacute glomerulonephritis. The control observations in this patient revealed a normal renal plasma flow but a moderate reduction in the rate of glomerular filtration. There was moderate hematuria and moderately severe albuminuria. A slight elevation of the blood urea nitrogen was noted during the first week of control studies but this had returned to within normal limits prior to the use of cortisone. The patient was given 150 mg. cortisone daily for twenty-eight days. During the period of steroid administration the rate of glomerular filtration increased and approximated a nor-

Tmpah = maximal tubular excretory capacity for para-aminohippurate.

mal value. This increase in filtration was maintained for two weeks after cessation of the hormone, but thereafter the rate returned to the control level. Hematuria, albuminuria, and the blood urea nitrogen were not significantly altered.

The fourth patient (Table IV) was a forty-one-year-old man with the nephrotic phase of chronic glomerulonephritis. Control observations revealed a reduction of both the renal plasma flow and the glomerular filtration rate. There was moderate hematuria and albuminuria, but no azotemia. He was given cortisone, 100 mg. daily, for twenty-one days. After a two-week interval he was given a second course of 200 mg. daily for nine days. There were minor elevations of the renal plasma flow but the glomerular filtration rate was not appreciably altered. Hematuria persisted and albuminuria actually increased. The blood urea nitrogen also rose during the period of hormone administration. In general all observations had returned to the control levels by the second or third week after discontinuance of the drug.

The fifth patient (Table V) was a twenty-eight-year-old woman with chronic disseminated lupus erythematosus. The control observations revealed a moderate reduction of the renal plasma flow but a proportionately greater reduction of the glomerular filtration rate. There was moderate hematuria and albuminuria and a slight elevation of the blood urea nitrogen. A total of 4.625 grams of cortisone was administered during a twenty-eight day period. The rate of glomerular filtration increased during the period of hormone administration but returned to the control level three weeks after the drug was discontinued. There was some increase in hematuria and a definite increase in albuminuria. There was a striking increase in the blood pressure during the third week of cortisone administration and a severe hypertension persisted for two weeks after the drug was stopped. At the time of hospital discharge the patient still had marked hematuria, albuminuria, and a persistent hypertension. Approximately three months later she was known to have expired in another hospital.

The sixth patient (Table VI) was a twenty-three-year-old man with subacute disseminated lupus erythematosus. The control observations revealed a normal renal plasma flow, a normal tubular excretory capacity for para-aminohippurate, but a marked reduction of the glomerular filtration rate. There was a moderate hematuria, severe albuminuria, and an elevated blood urea nitrogen. Cortisone was administered in a dose of 150 mg. a day for twenty-five days. Despite this there was a further decrease in the glomerular filtration rate and a fall in the renal plasma flow. As further evi-

THE PRESENT STATUS OF BCG VACCINATION

E. FENGER, M.D.

Oak Terrace, Minnesota

ON July 12, 1950, the Public Health Service, Federal Security Agency, licensed the Research Foundation and the University of Illinois for the manufacture, exportation, importation, and the sale of BCG vaccine. This vaccine is now available commercially. I believe that this means that many of us may be called upon soon for advice as to BCG vaccination. I believe that we must either accept or reject this procedure in the control of tuberculosis.

I would, therefore, like to briefly discuss the present status of this controversial subject.

In 1908 Calmette and Guerin announced that they had developed a strain of bovine tubercle bacilli which was avirulent for cattle. In 1920 they reported that this BCG culture was harmless to man. Since that time millions of persons have been vaccinated with this product. During the past ten years, especially since the end of World War II, the use of BCG has increased tremendously. This is especially true in the Scandinavian countries and other countries of Europe, South America, China, and Japan. The World Health Organization, WHO, has been a very strong booster for vaccination throughout the war-ridden countries. Concerning Japan, it should be mentioned that most of their vaccination has been done with the dried vaccine. Brigadier General Sams reports that 31 million persons have received BCG immunization up to May of 1949 as a result of a tuberculosis control program inaugurated by the Supreme Command of the Allied Powers.

The joint enterprise is a co-operative effort between UNICEF and the Scandinavian Voluntary organizations on an international scale primarily with the objective of assisting national health authorities in the execution of mass BCG vaccination campaigns, and in introducing BCG recognition as one of the tools in their long-range tuberculosis control program. The joint enterprise has vaccinated millions.

Here in the United States we have been very slow in accepting this procedure. Our mortality and morbidity rates have been and are much lower than those of the other countries of the world. Our facilities for the diagnosis, care and treatment of the tuberculous are likewise better than those found throughout the world. Therefore, the necessity for mass vaccination in our country has not been present.

The fact that Dr. W. G. Workman, Chief, Laboratory of Biologic Control, National Institute of Health, has licensed BCG means, according to Dr. Robert Anderson, Chief, Division of Tuberculosis, U. S. Public Health Service, "that the vaccine produced by the licensed laboratory has been found safe by trial with animals, that it is free from contaminating substances, and that it will produce a satisfactory immediate reaction in animals and human beings when used within the prescribed time limit."

Endless controversies concerning the dangers and the effectiveness of BCG have been present in the United States for many years. The dangers of vaccination can now be considered nil. The effectiveness as an immunizing agent is still open for discussion. Failures of vaccination may be due to (1) quantitative conditions connected with the preparation of the vaccine, or (2) the lack of technique for differentiating between allergy and protective immunity. Dr. Rene J. Dubos states that it is almost certain that the immunity produced by the vaccine is the outcome of a limited but definite multiplication of the attenuated bacilli in the body of the animal undergoing immunization, chiefly in the regional lymph nodes. The degree of immunization probably reflects in a certain measure the extent of this multiplication. It is very likely, on the other hand, that the degree of multiplication depends in turn upon at least four independent factors, namely, (1) the number of living micro-organisms injected, (2) their physiological state, (3) level of attenuation (or virulence), (4) susceptibility of the immunized individual.

Another problem, not yet answered, is the length of protection. How often must we re-

---

Dr. Fenger is Assistant Medical Director of Glen Lake Sanatorium, Oak Terrace, Minnesota.

Read at the annual meeting of the Minnesota State Medical Association, Rochester, Minnesota, May 1, 1951.

vaccinate? Dr. Tonderlung of Copenhagen states that immunity will last from four and one-half to five years. That is the usual time stated. But the studies have not been too well carried out. Many of these problems are now being studied in the several projects of the Public Health Service, including the duration of immunization, method of administration, effectiveness, and evaluation program. The U. S. Public Health Service at the present time has three studies in progress:

1. In 1947 they began vaccinating the Georgia school children. This study is still going on and will involve nearly 75,000 children.

2. The Indian study. This has now reached a total of 30,000.

3. The largest study project consists of a cooperation program launched last fall with the Department of Health of Puerto Rico. The entire school system is involved.

Much has been said as to the lack of controlled studies. I believe that Dr. R. R. Ferguson's studies in Canada have been well controlled. His study of nurses and employes in the general hospitals of Saskatchewan showed a decrease in the morbidity rate among the vaccinated in general hospitals 1 to 4 and in the Sanatorium group 1 to 5 of the incidence as compared with the previous five-year incidence before vaccination was inaugurated. His experience with the vaccination of the highly exposed Indians showed a decrease of 1 to 4 in the morbidity and mortality rates among the vaccinated as compared to the controls.

The Aronson and Palmer studies conducted among the American Indians are carefully controlled. The vaccination program began in 1936. An eleven-year follow-up shows 1,551 vaccinated, 1,457 controls. The morbidity rate was 27.8 in the controls and 11.1 in the vaccinated group. The tuberculosis mortality rate showed a difference favorable to the vaccinated of 0.4 and 3.5. There are many other studies that could be mentioned.

It might be of interest to look at the figures concerning the amount of BCG vaccine distributed here in our own country. We have three laboratories producing BCG vaccine. Dr. Joseph D. Aronson of the Henry Phipps Institute, Philadelphia, stated that with few exceptions the Institute does not provide BCG vaccine outside the State of Pennsylvania. It has, however, provided BCG vaccine to the United States Indian Service. From July 1, 1949, to January 28, 1950, 3,438 persons have been vaccinated in the State of Pennsylvania with this vaccine. During the first half year of 1950 another 1,600 were added. Dr. Konrad Birkhaug of the Health Department, State of New York, stated that the Health Department cannot provide BCG vaccine outside the State of New York except for a few specified United States Public Health Service projects. It has provided the Philippine Islands with 2,000 doses of vaccine weekly for thirty-eight weeks and the Puerto Rico project with 10,000 doses weekly for twenty-four weeks. During 1948 and 1949, 6,596 vaccinations were performed in the State of New York. In a letter received from Dr. Birkhaug in September of 1950, he stated that during the first eight months of this year 1,450 individuals were vaccinated in New York and 1,390 of these became tuberculin positive, or 96 per cent. He ends his letter with, "My general impression is that BCG vaccination is increasing rapidly in New York and is being used extensively for nurses, medical students, hospital personnel, children's clinics (Harlem, New York City, Albany, Buffalo, Syracuse), and in mental hygiene institutions. But, even so, this is only a small fraction of the vaccine that we are sending out of this state which has already been inocculated into more than one million individuals during the past eight months." Dr. Sol Rosenthal of the Tice Laboratory, Chicago, Illinois, reported that during one year, 1949-1950, the Tice Laboratories have provided BCG vaccine to 103 institutions. These include seventeen medical schools and forty-four schools of nursing. The recipients were located in sixteen states, two territories, and the District of Columbia. In 1950 Tice Laboratories shipped 179,000 doses, and during the first three months of 1951 they equaled that figure.

Very little vaccination has been done in Minnesota. At Glen Lake Sanatorium we have vaccinated more than 350 persons. We have been vaccinating our negative tuberculin reacting prospective employes, student nurses in some of the hospitals in Minneapolis, namely, Eitel, Northwestern, Abbott, and a few at St. Mary's, St. Andrew's, St. Joseph, and St. Barnabas. We have also vaccinated children in homes where ex-patients would be sent who occasionally have a positive gastric culture. At Nopeming Sanatorium, just outside of Duluth, over 270 vaccinations have been done, A small amount of vaccination has been done at the Veterans Administration Hospital in Minneapolis, and here at the Mayo Clinic.

At the present time I believe we should follow the American Trudeau Association's recommendation, namely, vaccination of the following more vulnerable groups, provided they do not react to adequate tuberculin tests:

1. Doctors, medical students, and nurses who are exposed to tuberculosis.
2. All hospital and laboratory personnel whose work exposes them to contact with the bacillus of tuberculosis.
3. Individuals who are unavoidably exposed to infectious tuberculosis in the home.
4. Patients and employes in a mental hospital, prison, and other custodial institutions in whom the incidence of tuberculosis is known to be high.
5. Children and certain adults considered to have inferior resistance and living in communites in which the tuberculous mortality rate is unusually high.

It is to be emphasized that BCG vaccination must not be regarded as a substitute for approved hygienic measures or for the public health practices designed to prevent or minimize the tuberculous infection and disease. Vaccination should be regarded as only one of the many procedures to be used in tuberculosis control program.

THE EFFECT OF CORTISONE IN GLOMERULONEPHRITIS

(Continued from Page 542)

dence of the progressive renal dysfunction the Tm PAH decreased approximately 50 per cent. Hematuria, albuminuria, and azotemia increased. A severe hypertension also developed. During hormone administration there was a somewhat paradoxial rise in the serum potassium concentration and a fall in the serum sodium concentration. Six weeks after the completion of the studies the patient died of severe renal insufficiency and hyperpotassemia. Microscopic examination of the kidneys revealed lesions of subacute glomerulonephritis and the wire-loop capillaries of lupus erythmatosus. There was diffuse glomerular involvement and marked tubular atrophy.

Discussion

Analysis of the data that has been presented reveals that transient improvement in renal function, as measured by the renal plasma flow and glomerular filtration rate, may occur during the administration of cortisone. Hematuria and albuminuria, however, did not decrease, and in some instances actually increased. It is apparent that some of the observed changes in renal hemodynamics are due to spontaneous fluctuations in the disease process, but others seem to be associated with the cortisone administration. The mechanism by which these transient increases in renal function may be caused by this hormone is unknown. Two mechanisms which may be involved are as follows: (1) a direct effect of cortisone upon the glomerular capillary bed or the renal vasculature; (2) an indirect effect of cortisone mediated through an increased extra cellular fluid volume. It is extremely unlikely that this steroid has any primary effect upon the glomerular capillaries or the basic pathologic lesion. At least some of the observed changes are probably related to the alterations in the extracellular fluid volume.

Summary

Four patients in the various phases of glomerulonephritis and two patients with the nephropathy of dissenminated lupus erythematosus were studied during cortisone administration. Although transient changes in the renal hemodynamics were observed, hematuria and albuminuria did not decrease and, in some instances, actually increased. Cortisone had no demonstrable beneficial effect upon the basic pathologic process in the glomerular capillaries. In both patients with lupus erythematosus, severe hypertension was produced.

INFANT MORTALITY IN MINNESOTA, 1950

A. B. ROSENFIELD, M.D., M.P.H.
Minneapolis, Minnesota

EMERSON W. STOREY, B.S., M.S.
Saint Paul, Minnesota

DATA concerning certain medical problems associated with births have been collected routinely for many years by various state health departments. Since January 1, 1950, when revised birth certificates and stillbirth certificates were first used in Minnesota, certain information relating to prematurity, congenital malformations, and weeks of gestation, as well as birth weight, has become available for statistical study.

The observations presented in the present article are based on limited and, in some cases, incomplete data and, of course, cannot serve as a substitute for detailed clinical studies. However, even limited information on a large number of births should be helpful in determining the size and extent of the problem and in developing public health programs, which may lead, with the co-operation of the medical profession, to further reductions in infant mortality. In addition to summarizing the available data, the limitations and deficiences encountered will also be pointed out so that the need for accurate and complete information on the birth and stillbirth certificates will be understood by physicians. It is hoped that physicians will be gracious in furnishing diagnoses of congenital defects (which are not required on certificates) when such information is requested by the State Department of Health. The value of birth registration data in programs for reducing maternal and infant mortality will thus be considerably enhanced.

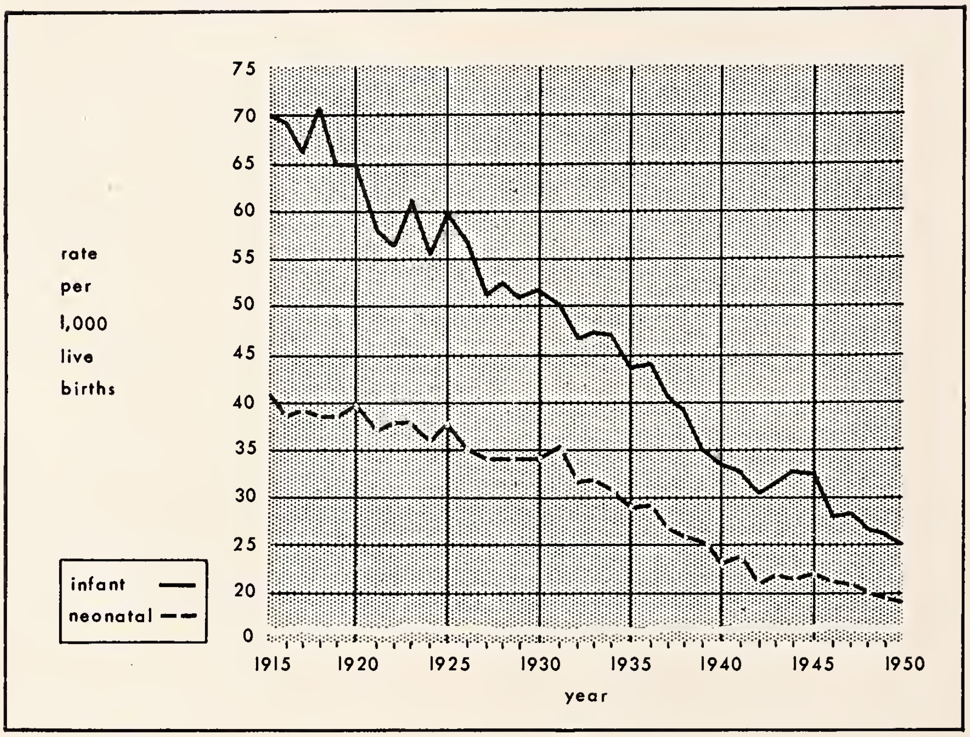

Fig. 1. Infant and neonatal death rates for Minnesota, 1915-1950.

Infant Mortality

There has been a continuing decrease in Minnesota in infant mortality, which reached a rate of 25.0 per 1,000 live births in 1950, a decrease of 64 per cent since 1915, when the rate was 70.1 (Fig. 1). This decrease in deaths was accompanied by an increase in live births to 75,337 and

---

Dr. Rosenfield is Director, Division of Maternal and Child Health, Minnesota Department of Health.

Mr. Storey is Statistician, Division of Vital Statistics, Minnesota Department of Health.

a birth rate of 25.2 per 1,000 of population. Indians constitute about 0.5 per cent of the total state population (approximately 14,500). There were 599 Indian births and 26 infant deaths, with a mortality rate of 43.4 per 1,000 live births. This rate was 67 per cent higher than the state rate but it was a reduction of 22 per cent from the 1949 rate. Provisional statistics show 1,874 deaths of infants under one year. More deaths occur during the first year of life than during any other one-year period. As a matter of fact, there are almost as many deaths in infancy as there are in all of the next thirty-nine years. It should be noted that 98.3 per cent of all births in Minnesota during 1950 occurred in hospitals, and 99.8 per cent were attended by physicians. There is, therefore, no problem of home deliveries or nonmedical attendance.

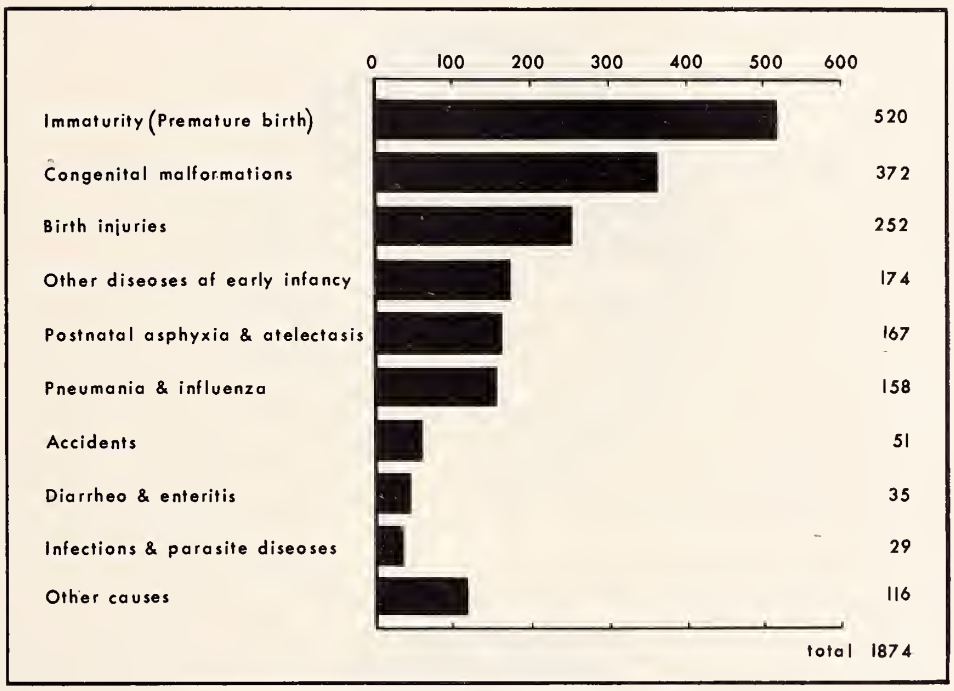

Fig. 2. Infant deaths by causes and number in Minnesota, 1950.

TABLE I. LIVE BIRTHS BY WEIGHT, COLOR, AND PLURALITY—MINNESOTA 1950 (PROVISIONAL)

Weight	Total		White		Non-white		Single		Multiple	
	No.	%	No.	%	No.	%	No.	%	No.	%
5 lb. 8 oz. or less (Immature)	4,401	5.8	4,294	5.8	107	8.4	3,616	4.9	578	38.9
5 lb. 9 oz. and over (Full term)	70,370	93.4	69,258	93.5	1,111	87.4	69,489	94.3	881	59.4
Not stated	568	0.8	513	0.7	55	4.2	543	0.74	25	1.7
Totals	75,339	100.0	74,065	100.0	1,273	100.0	73,648	100.0	1,484	100.0

Causes of infant deaths are shown in Figure 2. The leading cause of death was immaturity (prematurity), which was responsible for 28 per cent of the deaths. This was a decrease of almost 10 per cent from 1949, when immaturity was responsible for 37.4 per cent of infant deaths. In second place were congenital malformations, which accounted for 20 per cent, and in third place were birth injuries, accounting for 13 per cent of the mortality. Postnatal asphyxia and atelectasis were responsible for 9 per cent of deaths, pneumonia and influenza for 8 per cent, external causes for 3 per cent, and diarrhea and enteritis for less than 2 per cent. These figures showed slight variations from 1949.

Immaturity (Premature Birth)

Under the generally accepted statistical definition of immaturity (5.5 pounds or 2,500 grams or less), 5.8 per cent of all live births in Minnesota in 1950 were immature (Table I). Non-white births constituted 1.7 per cent of all births, but 8.4 per cent of these births were immature. As would be expected, almost 40 per cent of multiple births were immature in contrast to 5 per cent of single births. Only 0.8 per cent of all certificates of live births failed to record the birth weight, but five times as many certificates of non-white births omitted the weight. Almost 40 per cent of stillbirths were immature, but 25 per cent of the stillbirth certificates failed to show the birth weight (Table IV).

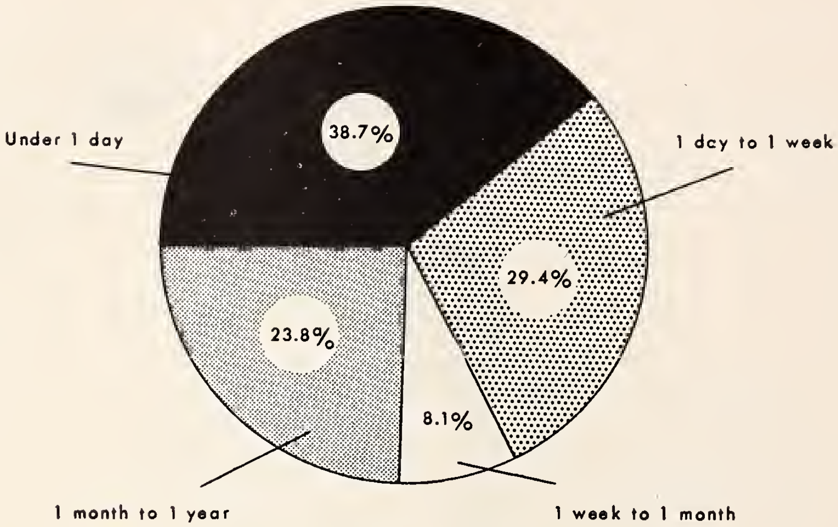

Fig. 3. Infant deaths by age period, Minnesota, 1950.

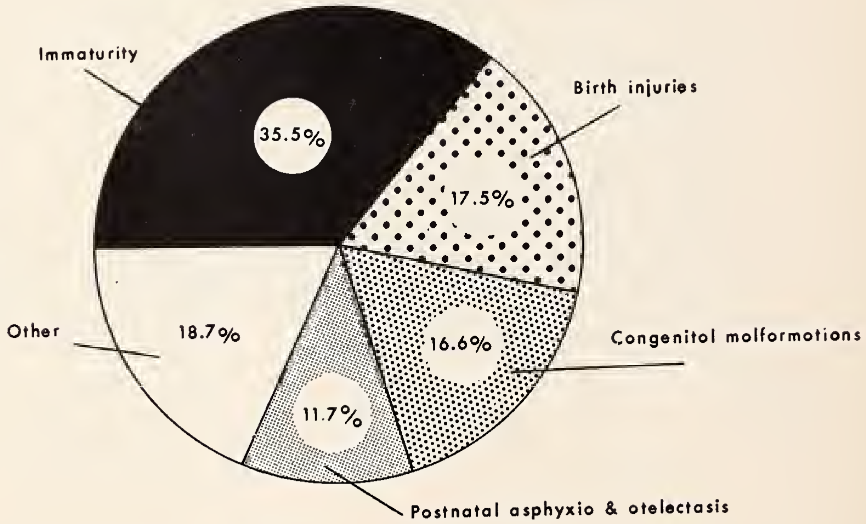

Fig. 4. Neonatal deaths by percentage, Minnesota, 1950.

Neonatal Mortality (First 30 Days of Life)

While infant mortality has decreased 64 per cent since 1915, neonatal mortality has decreased 54 per cent to a rate of 18.9 per 1,000 live births (Fig. 1). Almost 40 per cent of all infant deaths occurred on the first day of life, and another 29 per cent from one day to one week. Seventy-six per cent of all the deaths occurred under one month, and only 24 per cent between one month and one year (Fig. 3). It is apparent that there has been greater success in reducing deaths in the age group from one month to one year than among those occurring during the first thirty days of life.

Immaturity was responsible for 35.5 per cent of all neonatal deaths and 93 per cent of these deaths occurred during the first week of life (Fig. 4). This was a decrease of 14 per cent from 1949, when immaturity accounted for 49 per cent

TABLE II. POSTNATAL DEATHS BY CAUSE—MINNESOTA, 1950 (PROVISIONAL)

	No. of Deaths	Per Cent
Diseases peculiar to first year of life:		
Congenital malformations	134	30.1
Birth injury	2	0.4
Immaturity	13	2.9

TABLE IV. STILLBIRTHS BY WEIGHT AND CONGENITAL MALFORMATIONS—MI 1950 (PROVISIONAL)

Weight	Total		Congenital Malformations		
	No.	%	Yes	No	Not Stated
5 lb. 8 oz. or less (Immature)	489	39.5	80	325	84
5 lb. 9 oz. and over (Full term)	440	35.6	57	324	59
Not Stated	308	24.9	35	131	142
Totals	1,237	100.0	172	780	285

of the neonatal deaths. It is of interest to note that more than one-third (35.5 per cent) of neonatal deaths occurred among only 5.8 per cent of the live births (immature infants weighing 5.5 pounds or less), while 65 per cent of the neonatal deaths occurred among 94.2 per cent of the full-term live births (over 5.5 pounds in weight). Among the ten leading causes of death, prematurity is now in eighth place. Birth injuries and congenital malformations were each responsible for 17 per cent of the deaths, as in 1949. Congenital malformations are now in ninth place among the ten leading causes of death. Postnatal asphyxia and atelectasis caused 12 per cent of the deaths. Deaths from pneumonia (2.9 per cent) and external causes (1.1 per cent) occurred at the same rate in the previous year, but diarrhea of newborn occurred in only four infants (0.3 per cent).

Postnatal Mortality (1 month to 1 year)

The chief cause of death in this group (Table II) was congenital malformations, which were responsible for 30 per cent of the deaths during this period. This total is an 18 per cent increase over 1949 but is probably due to more frequent autopsies and more accurate diagnoses rather than to a real increase in mortality. Pneumonia and influenza, in second place, were responsible for 26 per cent of the deaths, a decrease of 16 per cent over the 1949 deaths, which amounted to 31 per cent of the total. In third place were deaths from external causes, which decreased from 11 per cent to 8 per cent. Diarrhea and enteritis deaths decreased from 10.8 per cent in 1949 to 7 per cent in 1950.

Congenital Malformations

A tabulation of certificates of live births (Table III) shows that, of 4,401 immature births, 2.5 per cent indicated congenital defects. The question was not answered on 6.3 per cent of the certificates. Among full-term newborns (more than 5.5 pounds) 0.97 per cent indicated congenital defects. On 6.0 per cent the question was not answered. Such defects, therefore, were noted two and a half times as often in immature infants as in full-term live-born infants.

Stillbirths certificates recorded congenital defects in 17 per cent, of which immature stillbirths totalled 20 per cent while full-term stillbirths totalled 15 per cent, but 15 per cent of the certificates in this group failed to answer the question. Of the total of 1,237 stillbirth certificates, 23 per cent failed to answer the question.

Since birth certificates require only "yes" or "no" to the question of congenital malformations, diagnoses are not available on live-birth certificates. It is, therefore, planned to query physicians for specific diagnoses in an effort to determine the frequency of occurrence of various defects and their ultimate outcome. Minor anomalies are infrequently noted on birth or death certificates. In addition, a significant number of infants who are believed to be normal at birth

TABLE V. INFANT DEATHS DUE TO CONGENITAL MALFORMATIONS—MINNESOTA, 1950 (PROVISIONAL)

	Under One Year	Under One Month	One Month to One Year
Total	372	238	134

are found later in life to suffer from hidden anomalies.

Specific causes of infant deaths due to congenital malformations are tabulated in Table V. Of the total of 372 such deaths, 238 (64 per cent) occurred during the neonatal period and 134 (36 per cent) died from one month to one year. Slightly more than 80 per cent of all deaths due to congenital malformations occurred within the first year of life. During the first month (neonatal period) congenital defects of the circulatory system accounted for 36 per cent of the deaths, defects of the central nervous system for 23 per cent, monstrosities for 14 per cent, and defects of the digestive system for 12 per cent. It has already been stated that congenital malformations are responsible for one-sixth of all neonatal deaths (16.6 per cent) and for 20 per cent of infant deaths.

During the postnatal period (one month to one year) congenital malformations were responsible for 30 per cent of the deaths. Defects of the circulatory system were responsible for 46 per cent of deaths, defects of the nervous system for 35 per cent, and defects of the digestive system for 11 per cent.

The mortality rate among infants in the postnatal period is less than one-third that among infants under one month of age. Therefore, any sizable reduction in total infant mortality must be achieved during the neonatal period and possibly among stillbirths. The chief causes of death during this period are immaturity, birth injuries, and congenital malformations, which together are responsible for 70 per cent of all the deaths.

Many of the early births are due to obstetric complications which must, at present, be considered as unpreventable. In many instances, pregnancy probably could have been carried safely to a period of decreased risk to the infant by better prenatal care, adequate nutrition, and good clinical judgment and techniques in obstetrics. If the pregnancy does terminate in a premature birth, more adequate facilities and better trained medical and nursing personnel to treat prematures are necessary. A number of states have established centers to which premature infants are transported for special care. This problem involves medical care and is of a type that is not engaged in by the Minnesota Department of Health. Since the greatest mortality occurs on the first day of life, it is not considered advisable here to transport premature infants to such centers. It is felt that prematures can be handled locally by providing more adequate facilities in rural hospitals and by assisting in developing better equipped nurseries and better trained medical and nursing personnel in larger regional hospitals.

While many birth injuries are unavoidable, it is hardly necessary to point out that the type of anesthesia and analgesia, induction of labor and the clinical judgment and techniques used in operative procedures play an important part in events that may affect the newborn.

In the past, little attention has been given to congenital malformations, because inherited defective germ plasm cannot be controlled. In recent years it has been recognized that congenital anomalies may be acquired during pregnancy as a result of maternal disease, and certain environmental factors which can be controlled have been studied. For instance, Ebbs, Tompkins, and others have demonstrated that a proper diet, with adequate protein, vitamins, and minerals, decreases the number of stillbirths, toxemias, prematures, and congenital malformations. Experimental work by Warkeny, Ingalls and others has demonstrated the effects of diet in malformations

(Continued on Page 617)

EMERGENCY BLOOD TRANSFUSION

THOMAS H. SELDON, M.D.
Rochester, Minnesota

THE present state of world affairs demands a constant awareness of the possible sudden need for supportive treatment for large groups of people.

It is not within the province of this paper to weigh the pros and cons in the controversy over the need of a massive blood-grouping program; neither is it my intention to discuss the requirements for an adequate local civil-defense program for the maintenance of an emergency supply of blood.

Rather, I wish to emphasize a few salient points in respect to a situation in which an emergency transfusion of blood might be needed.

The two most important and inclusive reasons for transfusion of blood are: (1) to increase the total circulating blood volume, and (2) to increase the oxygen-carrying power of the blood.

Either of these indications is, or both are, applicable to routine medical patients as well as to surgical or other patients who need supportive therapy to prevent the onset of shock or to treat a patient already suffering from shock.

True, there are other indications for the use of blood transfusion therapy, but in view of the fact that the subject is "emergency blood transfusion," the foregoing two indications probably cover the indications for emergency transfusion adequately.

Clinical Diagnosis Leading to Emergency Transfusion

Depletion of the blood volume by the loss of whole blood, plasma or water is encountered under many circumstances.

Many medical conditions tend to produce such a depletion of blood volume; gastrointestinal hemorrhage and chronic ulcerative colitis come readily to mind. Severe trauma, surgical operations, extensive burns and many other conditions may tend to produce shock accompanied by a loss of blood volume.

Much knowledge has been gained concerning specific points of importance, such as how much loss of blood may be anticipated under certain operative procedures; how satisfactorily will the compensatory circulating mechanisms function under certain traumatic circumstances; how well will a patient withstand a debilitating disease without supportive treatment?

Properly to evaluate the patient's condition, whether it be a sudden surgical or traumatic emergency, or whether a medical patient has suddenly demonstrated the clinical picture of shock, three questions must be considered:

First, is the total blood volume decreased?

Second, what is lost—whole blood, plasma or water?

Third, what and how much is needed to restore the patient to a good physical condition?

Determination of loss of blood volume is not readily done without some equipment and the expenditure of time. The specific gravity of the blood may be estimated, dye may be administered intravenously and the resultant dilution determined, sponges may be weighed before and after operation, and so on. However, it would appear that critical evaluation based largely on observation must be depended on to a large degree.

Decision as to whether whole blood, plasma or water is the component lost is of real importance in selection of the type of therapy needed. Knowledge of the medical disease present or of the physical condition of the patient suffering from trauma or surgical intervention is helpful in arriving at a decision.

Shock due to simple loss of water occurs only in extreme alterations of fluid balance. This loss of water must be at least 6 per cent of the body weight before clinical signs of dehydration will be apparent. Even at this point, there is no real marked loss of blood volume, unless loss of water becomes so rapid that the ordinary compensatory mechanisms protecting the plasma volume are functioning inadequately. In this instance, hypotension and marked hemoconcentration may appear.

For evaluation of the loss of plasma volume a hematocrit determination may be suitable. Usual-

---

From the Section on Anesthesiology, Mayo Clinic, Rochester, Minnesota.

Read at the annual meeting of the Minnesota State Medical Association, Rochester, Minnesota, May 1, 1951.

ly, an elevation of 1 above the normal per cent of 45 is accepted as corresponding to the loss of 100 c.c. of plasma. A loss of blood volume of approximately 35 per cent, which corresponds to a hematocrit reading of 60 to 65, usually results in low blood pressure. These observations do not necessarily obtain in the presence of burns after secondary anemia has made its appearance.

When whole blood is lost, the hematocrit determination is of relatively little value so far as estimation of the total loss of blood is concerned. Although different observers have varying opinions, the view in general seems to be that a blood pressure of less than 85 mm. of mercury is indicative of a 25 per cent loss of blood volume (1,500 c.c. in an average man). If vasoconstriction is marked and perhaps has been stimulated by the administration of vasopressor drugs, these clinical observations may be inaccurate.

Treatment

After the decision has been made as to the amount of blood volume lost and the particular component lost, and an idea has been formed as to what volume of therapeutic agent is warranted, treatment must be instituted. In view of the present knowledge of replacement therapy, it soon becomes evident that treatment for the most part will comprise the transfusion of whole blood or plasma and/or certain other solutions, such as saline, glucose, gelatin, dextran or other available agents.

The emergency nature of the situation and the occasional hampering effects of the site at which the emergency occurs must necessarily modify some of the more desirable details of the carrying out of any supportive therapy procedure.

Adjunct forms of therapy, such as the application of heat, placing of the patient in the shock position, administration of oxygen and so on will not be considered herein.

Restoration of Blood Volume.—Restoration of the reduced blood volume is the single, most important item in the treatment of traumatic and hemorrhagic shock. All other treatments are considered adjuncts. Restoration of blood volume must be considered from several points of view:

First, the type of fluid replacement available.

Second, the amount of fluid necessary satisfactorily to treat the patient.

Third, the response of the patient.

Fourth, the occurrence of any untoward reactions.

In most instances of clinical shock, the use of crystalloid solutions plays a secondary role; whole citrated blood or plasma is necessary to restore a normal circulation.

The general consensus now is that whole blood is the fluid of choice for restoration of blood volume. It is doubly valuable in view of the fact that after the treatment of shock with other fluids, anemia sometimes may be observed. Whole blood will ameliorate this situation. Yet there are situations in which whole blood may not be immediately and readily available; when this is true, other fluids necessarily will be used.

Insofar as possible, blood grouping and Rh typing should be carried out for recipients prior to the administration of blood. Similarly, if it is at all possible, cross-matching of the donor's blood cells and serum should be carried out with the recipient's serum and cells.

It is advisable to use the corresponding blood grouping and Rh typing of the donor and recipient; that is, blood group for blood group and Rh typing for Rh typing. In emergencies, a different situation arises; it is not always possible to determine the recipient's blood group and Rh type, and in such instances it is advisable to use group O blood from an Rh-negative donor.

Patient With Group O Blood as a Universal Donor.—At the Mayo Clinic it is the practice to determine the anti-A agglutinin titer of all group O donors. It has been noted that approximately 50 per cent of all persons whose blood belongs to group O have an anti-A agglutinin titer of 1:64 or less, the Mayo Clinic technique being used as the method of determination. It is our practice to administer group O donor blood which has an anti-A titer of more than 1:64 only to recipients whose blood type is group O.

Mathieson has observed that if group O donor blood recently has been administered to a recipient, it occasionally is difficult to determine conclusively the blood group of that patient if his blood is not in group O. This points up the advisability of determining the blood groups of prospective recipients before group O is administered. It follows, then, that when a blood grouping determination is requested and the patient concerned has received blood within a month, this information should be communicated to the laboratory.

Rh Typing.—It is the general consensus that corresponding Rh typing of the blood of the donor and that of the recipient should be the rule.

Insofar as possible, Rh-positive blood should be administered to patients with Rh-positive blood. It is known that certain patients with Rh-negative blood have been sensitized to the Rh factor by their having received Rh-positive blood by transfusion. Because of this possibility, whenever it is possible Rh-negative blood should be administered to patients who have Rh-negative blood.

When plasma has been lost, and the patient requires an emergency transfusion, the choice of fluid to be transfused should be obvious. Under such circumstances, human serum albumin does not seem to have any advantage over plasma.

Frozen, dried or liquid plasma seems to be equally valuable. In the special field of severe burns there is general agreement that plasma should be used initially and later followed by whole blood, as indicated.

Amount of Fluid Necessary for Replacement.—Many observers have advocated the use of formulas based on the hematocrit reading, on the erythrocyte count, on the value for hemoglobin, or on the specific gravity of the blood or plasma to determine the amount of blood or plasma necessary to be administered. These aids frequently are not readily available or are not practical. I believe that much emphasis should be placed on the clinical observations and the course of the treatment which is based upon these observations.

Circulatory failure which requires support in the form of emergency transfusion of blood may appear any time after severe trauma, or in medical emergencies during anesthesia or operative procedures, or postoperatively. In all instances it is imperative to give adequate supportive therapy. In circulatory failure the amount of fluid administered varies, as must the speed of administration. It may be that several hundreds of cubic centimeters of the right type of fluid may be administered rapidly enough to get 1,000 c.c. into the circulation quickly. Clinical judgment is very important in this respect.

Evaluation of the Response to Treatment

The whole purpose of the emergency transfusion of blood is to return the patient's physiologic and biochemical processes to as nearly normal as possible.

A good response is the return of the blood pressure to a reasonably normal level, followed by a slowing of the pulse rate and an increase in the total circulating blood volume. A lessening of the peripheral vasoconstriction and a return to normal of the cardiac output are important. There also should be a return to normal of certain biochemical criteria.

From a clinical standpoint, a warming of the skin, increased output of urine, improved pulse rate and increasing alertness of the patient are important.

Frequently, a poor response may be due to inadequate restoration of blood volume, continued bleeding and the like. If such poor responses persist, the emergency transfusion perhaps should be continued and operative interference considered if it is indicated. On the other hand, massive pulmonary edema may occur in late traumatic or postoperative periods and may be a cause of failure in the response to transfusion. If massive pulmonary edema occurs, a greater load of fluid such as would result from venous transfusion might unduly embarrass the patient. In such a situation arterial transfusion might be considered.

Conclusion

In these times of world unrest, no one is unaware of the potential needs for rapid and adequate supportive therapy. What is more imminent or actually present every day, however, is the mounting rate of accidents on the road, local civil disasters and other reasons for emergency transfusion. In addition to these, hospitals and physicians and surgeons every day are confronted with situations in which immediate supportive therapy is required. For these reasons and others, it is eminently desirable for all physicians to be aware of the fundamental principles of the important subject of emergency transfusion.

COIN LESIONS OF THE LUNG

DANIEL L. FINK, M.D.

Saint Paul, Minnesota

THE diagnosis of a solitary parenchymal nodular lesion of the lung has gained considerable importance in recent years by virtue of two stimulating factors. First, the routine chest x-ray examination of large sections of the population, and second, the marked advancements in thoracic surgery. For the past several years routine examinations of the chest have not only been done in large mass surveys, but have also become a routine part of hospital admissions as well as a part of the physician's routine physical examination. Were it not for the x-ray examination, most of the coin lesions would probably remain undiscovered. However, were it not for the possibility of surgical approach to these lesions, the importance of their discovery would obviously be minimized, if not altogether unimportant.

This study was undertaken largely in an attempt to determine whether or not any criteria could be established by which a differential diagnosis could be made prior to removal of the mass. Only those sharply circumscribed lesions of the lung which are globular in form and which are completely surrounded by lung tissue have been included in this study. All lesions related to the hilar area or those which superimpose themselves upon the hilum by virtue of their position near the midline have been omitted, as well as all lesions exhibiting fluid levels to indicate cyst or abscess formations. The term "coin lesion" has been used to denote a solitary lung nodule completely surrounded by lung tissue, and measuring 6 cm. or less in diameter. It is of course obvious that the term "coin lesion" is a misnomer, since the lesions are spheroid rather than disc-shaped. Nevertheless, the term is quite descriptive of the appearance of the lesion on the posteroanterior projections of the thorax upon the x-ray film (Fig. 1).

The discussion in the literature on this subject includes hilar lesions or those which are superimposed upon the hilum, and almost invariably includes lesions measuring up to 15 cm. in diameter. These lesions, it is felt, present a problem different from that of the coin lesion.

In this study an attempt was made to find a way to differentiate the malignant from the benign nodules. Of particular importance in this respect is the presence or absence of calcification within the lesions.

For the past few years we have attempted to discover a coin lesion containing demonstrable calcification, and which proved to be a primary malignant tumor. No such lesion has been observed in our experience. Thirty cases presenting coin lesions have been reviewed. In ten (33.3 per cent) calcium was demonstrable within the nodule, and not one of these proved to be malignant. Of the remaining twenty in which no calcium was demonstrable, ten (50 per cent) were malignant. This would therefore indicate that the presence of calcification is diagnostic of the benignancy of the lesion, while in the absence of calcium, there is a 50 per cent chance that the lesion is malignant. In the latter group, a diagnosis could not be made by any method short of resection and histological examination.

The presence of calcium within the coin lesion is frequently not readily apparent. Often special techniques are necessary before one can make this determination. Planigraphy has proved especially helpful in this situation (Fig. 2). When such apparatus is not available, a spot Bucky film may be useful. Although it is not within the scope of this paper to discuss indications or contraindications for operation, it is felt that the coin lesions with calcification need not necessarily be submitted to surgery.

On the other hand, those lesions without calcifications may be benign (Fig. 3) or malignant (Fig. 4). To recommend a period of observation may be misleading, since malignant lung nodules have been known to remain stationary for several years and thus lead the observer into a false sense of security, or may prove disastrous by becoming rapidly larger and possibly nonresectable (Figs. 5 and 6). In this group it is felt

that resection of the lesion at the earliest possible time after its discovery is the procedure of choice.

Summary

A coin lesion is defined as a solitary pulmonary nodule completely surrounded by lung tissue and measuring 6 cm. or less in diameter. Thirty such lesions were reviewed. All those containing calcium were benign, while 50 per cent of those without calcification were malignant.

It is felt that the calcified lesion should be treated conservatively.

Exploration and resection of the noncalcified lesion is recommended at the earliest possible time after its discovery.

Tuberculosis has so far been habitually considered to be a manifestation of social misery, and it has been hoped that an improvement in the latter would reduce the disease. Measures specifically directed against tuberculosis are not known to preventive medicine. But in future the fight against this terrible plague of mankind will deal no longer with an undetermined something, but with a tangible parasite, whose living conditions are for the most part known and can be investigated further. —Dr. Robert Koch, a translation by Berna Pinner and Max Pinner according to a paper read before the Physiological Society in Berlin, March 24, 1882, and from the *Berliner klinische Wochenschrift,* 1882.

THE MANAGEMENT OF VASOMOTOR RHINITIS

JAMES B. McBEAN, M.D.
Rochester, Minnesota

NO entirely satisfactory form of therapy exists for vasomotor rhinitis. The literature is full of many types of treatment, none of which is effective in all cases. It seems increasingly evident from the recent literature that many authors are of the opinion that specific extrinsic allergy is a less common cause of vasomotor rhinitis than is intrinsic allergy. It is certainly true that in a large proportion of patients with vasomotor rhinitis the results of skin tests are all negative, and no specific allergy can be discovered. Recent articles emphasize endocrine dysfunction, sympathetic-parasympathetic imbalance and psychosomatic factors as frequent causes of vasomotor rhinitis.

The diagnosis of vasomotor rhinitis may frequently be made from the history. The typical story is of attacks of nasal congestion, sneezing and watery or mucoid nasal discharge. The patient may observe certain aggravating factors, such as cosmetics, certain foods, animals, and so forth. However, it is very common for a patient to have no idea what brings on an attack. An occasional patient with vasomotor rhinitis will mention nervous tension as an aggravating factor, but probably the majority have no idea what initiates their attacks. There are also those who have the symptoms all the time. This is particularly true of the symptom of nasal congestion. The coexistence of vasomotor rhinitis and asthma or asthmatic bronchitis is very common, and many of these patients also have nasal polyposis. An interesting triad of symptoms—asthma, nasal polyposis and allergy to aspirin—has been frequently observed here.

On examination, the nose may be entirely normal if the patient is seen in a period of remission. In such cases the history is most important in making the diagnosis. If the nose is seen during a symptomatic period, the mucosa is usually pale and the turbinates are swollen and boggy in appearance. The tissues appear wet, and clear mucus may be present. Polypoid changes are often seen in varying degree, usually in the middle meatus. Roentgenologic examination of the paranasal sinuses frequently reveals thickened or edematous membrane, but often no pathologic change is seen on the films. The finding of eosinophils in smears of the nasal secretions is helpful in making the diagnosis, but is not essential. My colleagues and I do not routinely examine smears for eosinophils. Cutaneous tests for sensitivity to extrinsic allergens can be considered fairly reliable for the inhalants, but in our experience skin tests for foods are not reliable, and in adults are almost disregarded. At the Mayo Clinic a minimal number of skin tests are done. In the average case of vasomotor rhinitis, intracutaneous tests are done for mixed ragweed, timothy, orris root, horse hair, dog hair, cat hair, cattle hair, rabbit hair, mixed feathers, house dust, kapok, pyrethrum, and goat hair; and scratch tests are done for cottonseed, flaxseed and karaya. Tests for food are done usually in children and young adults by the scratch method. If a patient gives a definite history of seasonal hay fever, the tests for the pollens are done by scratch rather than intracutaneously.

There are many factors to be considered in the treatment of vasomotor rhinitis,[5] and certainly no one form of therapy is effective in all cases. One of the first and most important steps is to instruct the patient to avoid all intranasal medication. We are all familiar with the chronic nasal congestion produced by habitual use of vasoconstricting nose drops.[2] There are many patients with rhinitis medicamentosa,[4] in whom the nose will revert to normal after nasal medication is stopped. The use of intranasal medications containing the sulfonamide drugs or antibiotics is particularly to be condemned. The incidence of allergic reactions to these drugs is very high when used intranasally. Their use should be restricted to the treatment of infections.

If specific allergens are discovered on skin testing, or if the patient gives a definite history of increase in symptoms when exposed to certain substances, he should be instructed to avoid these substances if at all possible. Unfortunately,

---

Read at the annual meeting of the Minnesota State Medical Association, Rochester, Minnesota, May 1, 1951.

avoidance of extrinsic allergens is not always possible. This applies to such allergens as house dust or to substances with which a patient is in contact in his occupation. Most patients in whom no specific allergen is discovered, or in those sensitive to house dust, will derive benefit from the so-called dust-free bedroom.[1] Instruction in the preparation of such a room is given to these patients on the theory that about one-third of a person's life is spent in the bedroom. Dust-elimination measures consist of the application of dust-proof covers to mattresses and pillows; elimination of upholstered furniture and drapes which accumulate dust; the use of washable scatter rugs without rug pads; careful dusting of floors and furniture, preferably by someone other than the patient; and an air filter in the window. The air filter consists of an electric blower which forces air into the room through layers of cheesecloth mounted in a wooden frame in the open window. It is felt that this device should be used only in the summer. These patients do better sleeping in a warm room with the windows closed in the winter time. If the patient can afford it, an air-conditioning unit in the bedroom will be even more satisfactory than an air filter. In houses heated by circulating hot air it will be helpful to cover the air inlet in the bedroom with a cloth filter. All plants, flowers and household pets should be removed everywhere in the house. It should be remembered also that rug pads are made of cattle hair and their removal is advised if the patient has an allergy to this substance.

In regard to specific desensitization the greatest success is obtained in patients with pollen allergy or seasonal hay fever. It is not within the scope of this paper to discuss the details of hay fever therapy, and no attempt will be made to do so. It is our experience that other specific desensitization has not been very successful. Many authors have advised desensitization to dust in all cases of vasomotor rhinitis. Hansel and Shambaugh are among the leading advocates of this therapy. We feel that precautions against exposure to dust are more effective.

The antihistamine drugs are another addition to our armamentarium, but certainly do not offer complete or even partial relief to many patients. These drugs have become so numerous that to discuss them all would be impossible. A trial of antihistamine therapy is certainly worthwhile in all cases of vasomotor rhinitis. Those patients who derive benefit from them usually notice the improvement almost immediately. A long trial of antihistamine therapy without symptomatic improvement is of very little value. Patients vary greatly in the number of side reactions to these drugs. If a person receives symptomatic relief from the antihistamine but has a side reaction, such as drowsiness, a trial of several of the drugs is indicated to determine which one can be taken with the least side effect. The symptom of drowsiness is perhaps an advantage if the drug is taken at bedtime. It is to be remembered that the antihistamine drugs are not curative but offer only symptomatic relief.

It appears to be an accepted theory that there is a psychosomatic element in a large number of cases of vasomotor rhinitis. Nervous tension or neurosis of various types certainly plays a part in aggravating the symptoms in many patients. If other forms of therapy fail, a discussion of the functional aspects of the disease will be of help, at least in those patients who have some insight into their problems.

Nasal polyposis is probably the most common nasal complication of vasomotor rhinitis. The severity of polyposis is extremely variable. There may be a single small polyp in the middle meatus, or the nose may be completely filled with polyps. In the milder cases, it is not unusual to see the nasal mucosa revert to a state approaching normal under medical management. However, in the more severe cases with complete or partial obstruction, surgical removal is the best form of therapy. Recurrence of polyps after removal is so common that it is worth while to consider what type of operation offers the best hope for a permanently open nose. Certainly a major surgical operation is not to be considered if only one or two polyps are present which can be easily snared off in the office. The problem arises in those cases in which there are multiple polyps. Many of these patients have had numerous polypectomies and recurrences. It is felt that such patients are best operated on in the hospital under adequate local anesthesia. Most polyps are seen to arise in the middle meatus and appear to grow out of the ethmoid cells. They occur frequently also in the spheno-ethmoid recess, originating in the posterior ethmoids and sphenoid. In these patients thorough removal of all polyps in combination with intranasal ethmoidectomy, preserving the middle turbinate if possible, offers the best hope for a successful result. If polyps are present in the spheno-ethmoid recess, exenteration of the posterior ethmoids and opening the sphenoid should also be done. If nasal septal deflection is present to such a degree that access to the ethmoid area is difficult, a submucous resection adds greatly to the ease of the operation and requires very little more time.

It has been the practice at the Mayo Clinic for a number of years to use radium in combination with surgical treatment in many cases of multiple nasal polyps, especially those which have recurred several times. A 50 mg. tube of radium filtered with 1.0 mm. of platinum is placed in each ethmoid area and held in place with petrolatum (vaseline) gauze packing for three hours post-operatively. It is most difficult to draw any statistical conclusions from reviewing histories of patients treated with radium, but it is our impression that radium therapy is of some benefit in preventing recurrence. It is also our feeling that thorough surgical removal is even more important. Suppurative sinusitis may exist in patients with nasal polyposis, owing to blocking of the ostia of the sinuses. Here again careful but thorough removal of the polyps, with ethmoidectomy and the making of antrum windows, offers the best hope of cure.

Recently cortisone and ACTH have been tried in a few patients with nasal polyposis. The results have been encouraging in some, but in others no change in the polyps has been noted. It is too early to evaluate the results. It is possible that after cessation of therapy there will be a recurrence of the polyps.

Summary

There is no specific cure for vasomotor rhinitis. The medical treatment consists in avoiding offending allergens if they can be identified. All intranasal medication should be stopped. Desensitization offers the best hope in cases of seasonal hay fever. Its results in perennial vasomotor rhinitis have not been encouraging. Measures to reduce exposure to dust, such as the dust-free bedroom, should be employed. The antihistamine drugs may be used for symptomatic relief if they are effective. The functional factor should not be forgotten. Surgical therapy for polyposis is likely to be successful only if carefully and thoroughly carried out.

SOUTH DAKOTA ENACTS "POUND" LAW

A "pound law" bill was passed by the South Dakota Legislature and signed by the Governor on February 15, 1951. The law becomes effective on July 1, 1951.

The bill provides that animals needed for medical experimental purposes may be obtained under license issued by the State Department of Health from establishments maintained by municipalities for the impounding, care and disposal of animals seized by lawful authority.

Institutions that may apply for such license are schools and colleges of agriculture, veterinary medicine, medicine, pharmacy, dentistry or other educational or scientific institutions properly concerned with the investigation of, or instruction concerning, the structure or functions of living organisms, the cause, prevention, control or cure of diseases or abnormal conditions of human beings or animals.

The State Department of Health is empowered to adopt rules and regulations necessary to insure the humane use of animals in such experimentation with the right to inspect or investigate institutions licensed or applying for license to secure experimental animals.

The South Dakota action brings to a total of three, states that have recently passed similar legislation. Thirty-one communities also have effected policies concerning the disposal of unclaimed impounded animals for medical use. Legislation is now pending in seven other states.

BRONCHOSCOPY AND COMMON CHEST DISEASES

PAUL G. BOMAN, M.D.
Duluth, Minnesota

In the diagnosis and treatment of diseases of the chest, bronchoscopy is one of our more valuable aids. It often gives to the physician the final and only definite information on which a correct diagnosis can be established. It also provides a therapeutic approach which may be of the greatest importance in itself or as an adjunct to other therapy. To fully exploit and utilize this valuable diagnostic and therapeutic procedure, it is necessary that we be conversant with its potentialities, its limitations and its place in the orderly process of diagnosis and treatment.

Introduced slightly over fifty years ago, the bronchoscope at first found limited use, mainly in the larger medical centers and in the hands of the otolaryngologists. Its use in the mind of the average physician was surrounded by mystery and was associated mainly with the diagnosis and removal of foreign bodies in the respiratory passages.

Gradually the work of the pioneers in this field extended its usefulness and its application, until today bronchoscopic procedures play an important role in the work of the anesthesiologists, the chest surgeons, the specialists in diseases of the chest, especially in tuberculosis, as well as the otolaryngologists. The technical training of many men in these various specialties has made bronchoscopy increasingly valuable and important in the diagnosis and treatment of diseases of the chest and has extended its availability through these specialists to most members of the medical profession. Today this diagnostic and therapeutic aid need not be withheld from any patient who may need it.

Bronchoscopy may be explained as a procedure which enables us to extend our range of inspection. As the roentgen examination allows us to see beyond the confines of the skin and to observe certain normal and abnormal functioning of various organs and to note the changes produced by various disease processes, so bronchoscopy enables us to inspect the main respiratory passages and to note their relative position, size, shape and function, as well as the changes brought about by disease. Within the range of vision (and this has been greatly increased by the use of modern telescopic equipment), it reveals obstructive situations such as are brought about by foreign bodies, benign and malignant new growths, granulomatous and cicatricial reactions resulting from inflammatory disease, mucous plugs, compression and torsion of bronchi, et cetera. It further enables us to note the appearance of the mucosa and the bronchial secretions and to associate certain changes with definite known disease processes. It permits us to obtain direct cultures and smears from bronchial secretions and tissue for biopsy, either by means of the cutting forceps, or by the gelfoam impression technique. Likewise bronchial washings of areas beyond the range of vision furnish valuable material for the pathologist versed in special cellular pathology. The removal of accumulated secretions and pus paves the way for more diagnostic bronchograms.

From a therapeutic standpoint, bronchoscopy permits the removal of foreign bodies, of abnormal secretions and of aspirated material. In the hands of the anesthesiologist, it is of special value in the postoperative inspection of the air passages and the removal of accumulated secretions—blood, pus, or aspirated material which might produce atelectasis. This is of unusual value following thoracic surgery and following obstetric and emergency surgery anesthesia where aspiration of vomitus may take place. Where postoperative atelectasis has taken place, it is often a lifesaving procedure by permitting the removal of mucous plugs and retained secretions. Dilatation of stenosed areas and aspiration of pus may be of considerable value in bronchiectasis, certain types of tuberculosis, lung abscess, and, occasionally, in bronchial asthma.

In the diagnosis of diseases of the chest, as in all diagnosis, it is important that the physician utilize all available and necessary diagnostic aids, but he must use them in a proper and sequential

---

Dr. Boman is with the Department of Medicine, Duluth Clinic, Duluth, Minnesota.

Presented at the annual meeting of the Minnesota State Medical Association, Rochester, Minnesota, May 1, 1951.

order. The first and most important step in any diagnostic procedure is to obtain a careful and a comprehensive history from the patient and from the family; and this certainly applies in diseases of the chest. Then must come an intimate acquaintance with the patient in the form of a thorough and complete physical examination and observation of the patient's reaction to the disease through changes in temperature, pulse and respiratory rates, total and differential white counts and sedimentation rates. At this point the diagnosis may be established or suspected, and the physician can determine if he needs additional laboratory studies, roentgenological consultation and bronchoscopic assistance.

In most cases of pulmonary disease, roentgen studies are indicated and will usually give a definite and conclusive diagnosis if the data obtained are properly correlated with the history, the physical and laboratory findings. Where the diagnosis is not conclusive at this point, or if confirmation of a tentative diagnosis is desired, bronchoscopic examination should be carried out.

In order to utilize and correlate these procedures to the greatest advantage, there must be the closest co-operation between the attending physician, the clinical pathologist, the roentgenologist and the bronchoscopist. It is the obligation of the attending physician to provide the clinical history and all available data so that proper and specific diagnostic procedures may be carried out.

Without such co-operation and guidance, improper and inadequate roentgenograms may result, the energies of the pathologist may be dissipated in looking for acid-fast bacilli when he should have been studying cellular pathology, and the bronchoscopist may be unable to proceed effectively.

I am stressing this point because all too frequently patients presenting symptoms of chest disease are sent directly to the x-ray laboratory for a chest film without obtaining the important history or the physicial and laboratory data. This places the roentgenologist at a distinct disadvantage and he frequently cannot make an adequate examination. Then if the roentgen findings are indefinite, or uncertain (and they frequently are under such circumstances), a bronchoscopy is requested. Such a procedure can only result in dissatisfaction to all concerned and a very inadequate and often detrimental service to the patient. In many instances, a careful history and physicial examination, together with certain readily available laboratory procedures, would have established a diagnosis without the roentgen and bronchoscopic examinations, or would have rendered these examinations more valuable. They are expensive and often uncomfortable procedures for the patient and should not be ordered without due consideration, even as they should never be withheld when indicated.

What are the indications for bronchoscopic examination from the standpoint of the attending physician, and what are the contraindications to its use? In general, it may be said that it should be used whenever there is a history of the inhalation, or the possibility of inhalation of a foreign body, where the history and roentgen findings indicate bronchial obstruction due to new growth, either malignant or benign, where suppurative disease persists, where the cause of continuing cough and hemoptysis are unexplained, and whenever the roentgenologist needs help in interpreting certain abnormal findings.

Foreign bodies in the respiratory passages occur primarily in the younger age groups, 80 per cent occurring in individuals under the age of fifteen years, but they occur sufficiently often in the later decades so that we must be aware of this possibility. In children especially, the diagnosis can frequently be made from the history alone. At other times the diagnosis may be difficult. The presence of a radiopaque foreign body can be readily established by fluoroscopy or with a roentgenogram. The recognition of nonradiopaque foreign bodies is more difficult, and these are often overlooked. Here is where a careful history and proper roentgen studies are of the greatest value. Roentgen evidence of emphysema or atelectasis as noted under the fluoroscope, or on films taken on inspiration and expiration, is a definite indication for a bronchoscopic examination.

It is well to remember that after the initial coughing or gagging spell, an inhaled foreign body may produce no symptoms until it produces partial or complete obstruction of a bronchus. Many so-called recurrent pneumonias are due to unrecognized vegetable foreign bodies.

New growths, whether benign or malignant, may produce few and indefinite symptoms until obstruction of a bronchus occurs. When recognizable atelectasis has occurred, the diagnosis may be obvious, but the optimum time for the removal of the lesion may have passed. If we are to make progress in the treatment of malignant disease of the respiratory passages and lungs, we must be alert to the earliest symptoms, such as unexplained persistent cough, localized wheezing respiration, and occasional hemoptysis. Patients presenting these symptoms should have the advantage of every available diagnostic facility, including bronchoscopy. Careful collection and study of the sputum may demonstrate malignant cells in a high percentage of cases. Occasionally tumor tissue is coughed up and may be imbedded in paraffin, sectioned and studied microscopically. The secretions aspirated directly from the involved bronchus, or washings from such a bronchus, have yielded as high as 90 per cent of positive findings in certain clinics. While bronchoscopy is of the greatest value in arriving at a diagnosis, it may not always be readily available. In such instances we should not hesitate to utilize sputum studies to the fullest extent.

In benign lesions, such as adenomas, the diagnosis will depend on the bronchoscopic appearance of the lesion and on a direct biopsy of the same. Single observations and biopsies may not establish a diagnosis, and in such instances, repeated examinations are indicated.

In suppurative conditions, such as chronic bronchitis, bronchiectasis, and lung abscess, bronchoscopic examinations are indicated to rule out foreign bodies or other obstructing lesions, to determine the presence of stenosis, to obtain cultures and smears, to remove the accumulated secretions preliminary to bronchography, or for therapeutic purposes. These and other indications will occur to the conscientious physician as he attempts to solve the many complex diagnostic problems which face him. A careful analysis of all factors and sound clinical judgment should always direct his course of action.

The contraindications for bronchoscopy are few if the procedure is really indicated. It should not, as a rule, be employed in acute inflammatory disease of the respiratory passages or in the presence of active hemorrhage from the same. Caution in its use should be exercised in patients with heart disease, especially in the face of active or impending cardiac failure. It should be deferred or omitted if possible in patients with severe hypertension, with aneurysm, previous cerebral accidents, stenosis of the larynx or trachea, and in weak and debilitated individuals. In making a determination of whether the examination should be done in these patients, it is necessary to consider all factors and to be very certain that the need for the examination warrants the attendant risk and danger to the patient.

DDT INSECTICIDE SAFE IF WISELY USED

(Continued from Page 540)

mals being prepared for slaughter, the committee pointed out, since there is a danger of accumulation of the substance in the milk and tissues of treated animals.

Other precautions suggested by the committee are as follows:

"DDT insecticides should never be stored in food cupboards or medicine chests where there is a likelihood of contamination of food or mistaken use. All exposed foods, utensils, and working areas must be covered when kitchen and dining areas are being sprayed. Children's toys or cribs and rooms occupied by sick people should not be sprayed. Use of oil solutions on household pets should be avoided and DDT powders should be used only where they cannot be licked off. Intimate skin contact with aerosol discharge is to be avoided. Plants and aquariums in the home should be removed or covered before applying DDT sprays or aerosols. The use of oil solutions in the vicinity of open fires should be avoided because of the inflammability of such mixtures. . . .

"Persons exposed to large amounts of DDT dusts and powders under confined conditions or where dust particles are not carried away by free movement of air currents should wear respirators. [Chronic poisoning from DDT may result from prolonged ingestion or exposure to small amounts.] Such conditions might be encountered in mass delousing procedures, larviciding with dusts, and manufacturing or formulating operations. Protective clothing should be worn when there is a possibility of greases and oils contaminating the skin, thereby enhancing the absorption of DDT dusts or powders. . . .

"Frequent or prolonged exposure to emulsions or solutions of DDT in petroleum oils and organic solvents should be avoided unless protective clothing, goggles and neoprene or solvent-resistant gloves are worn. [Oily solutions may be absorbed through the skin.] Clothing must be changed promptly if concentrates are spilled on them. A contaminated skin area which has come in contact with DDT soaked clothing or spilled DDT concentrates should be washed immediately with soap and water. Concentrates should be mixed in well ventilated rooms and fire precaution observed when volatile and inflammable solvents are present. . . .

"Operators involved in large scale spraying or fogging with solutions of 5 per cent or more of DDT should wear respirators and other protective devices. Smoking is to be avoided during spraying when combustible mixtures are used. Greaseless skin lotions should be used on exposed body surfaces when irritant solvents are present in the formulation. Clothes should be changed and the body cleansed after each day's operation."—AMA News Release, March 9, 1951.

History of Medicine In Minnesota

MEDICINE AND ITS PRACTITIONERS IN OLMSTED COUNTY PRIOR TO 1900

NORA H. GUTHREY
Rochester, Minnesota

(Continued from the May issue.)

Pioneer physician of personal and professional merit, Harriet E. Preston was the first woman to seek membership, and one of the first three women to win it, in the Minnesota State Medical Society. Her experience in Minnesota resembled that of Dr. Ann Preston (1813-1872), native of Westgrove, Chester County, Pennsylvania, and graduate of the Woman's Medical College of Pennsylvania in 1852, whose name is forever linked with that college, in gaining professional place for women physicians in the hospitals of Philadelphia and in the Philadelphia County Medical Society. The story of Dr. Harriet E. Preston's persistent struggle for recognition, as recorded in the transactions of the Minnesota State Medical Society, makes good reading. In Winona, at a semi-annual meeting of the society in June, 1870, Dr. A. B. Stuart, at the request of Dr. W. W. Mayo, presented Dr. Preston's respectful request for "admission to the convention and for permission to take part in its deliberations." The physicians perhaps would have granted her admission to the convention; they balked at the idea of a woman joining in their deliberations, and refused her request by a vote of three to one.

Dr. Preston's candidacy for recognition started an argument that waxed and waned for ten years. At the beginning the proposed admission of women (specifically, Dr. Preston) was favored by Drs. Stuart, Mayo, Brewer Mattocks and W. W. Sweney; it was tolerated conditionally by others, notably Dr. C. N. Hewitt; and it was opposed bitterly by many, among them Drs. Solomon Blood, Alexander J. Stone and John H. Murphy. Dr. Murphy early foresaw defeat for he said, "This female-woman question is looming up and you can't stop it." In the arguments against admission of women the ancient clichés were aired: woman's physiological disability disqualified her; feminine delicacy would make impossible the frank discussion of certain matters that inevitably arise in medical practice; in short, woman's place was in the home. At Dr. Preston's second attempt, in 1871, the state society took refuge in the dignified statement that action could not be taken until the American Medical Association should accept as in good standing Dr. Preston's alma mater, the Woman's Medical College of Pennsylvania.

The American Medical Association at its meeting in San Francisco in 1871 debated the acceptance of delegates from "female colleges." It was distressing to learn that if members of the association were forbidden to recognize women physicians as colleagues and to consult with them professionally, it followed that members were barred automatically from recognizing the eminent Dr. Alfred Stillé, of Philadelphia, president of the American Medical Association, who was consulting physician at the Woman's Medical College of Pennsylvania. The whole subject was tabled indefinitely.

In 1871 also Dr. W. W. Mayo in a surgical report before the Minnesota State

Medical Society made public acknowledgment of Dr. Preston's able surgical assistance in various operations for rectocele, construction of artificial perineum, and amputation of the cervix uteri. The Wabasha County Medical Society defined its position: "Resolved that this Society looks upon all regularly educated physicians as our equals and does not consider that we violate any of our professional obligations by consulting with them." In 1874 the claims of women physicians again were brought before the state society and were rejected by a vote of twenty-seven to thirteen, and they were quashed again the next year. In the ensuing five years record was not made of further discussion. In 1880, however, the Committee on New Members, made up of Drs. M. Hagen, C. N. Hewitt and F. A. Dunsmoor, proposed Dr. Harriet E. Preston, Dr. Clara E. Atkinson and Dr. Edith M. Gould, all of St. Paul, as members. There were only three adverse votes; the election was recorded as unanimous.

Dr. Preston, in St. Paul, continued as a member of the state society up to and through 1888; thereafter her name did not appear on the Minnesota Register. Long afterward it was learned from the Woman's Medical College of Pennsylvania that Dr. Preston was registered in 1915 as living in Pennsylvania; in 1923 she was listed, "address unknown"; in 1929, "died." In the period 1906-1929 her name did not appear in any issue of the directory of the American Medical Association.

Marion Putnam, one of Olmsted County's early practitioners of medicine, was in Oronoco in the middle eighteen seventies and perhaps for some time earlier. In 1877 he attended an old settlers' meeting in Kalmar Township and in that year also was a representative of the Oronoco Lodge of Good Templars at a conference in Winona. Notes on early medicine in Nicollet County (unpublished, 1947) state that Dr. Marion Putnam, of uncertain professional rating, was in the village of Nicollet in 1878 and 1879.

Henry Raymond Randall (1864-1890) was an assistant physician, the sixth professional appointee, at the Second Minnesota Hospital for Insane at Rochester for ten months beginning in January, 1889.

Born in St. Peter, Minnesota, on November 20, 1864, "Harry" Randall grew up in that village and there received his early education in the public schools. Early in 1887, on graduation from Rush Medical College with the degree of doctor of medicine, he entered practice with Dr. D. A. Stewart in Winona. His state license, No. 1309 (R), was issued on February 25, 1887.

Dr. Randall was a young man of fine personality and excellent native ability. Early in his residence in Rochester he became a member of the Olmsted County Medical Society and the Minnesota State Medical Society. In October, 1889, resigning his position at the state hospital, he returned to Winona to resume partnership with Dr. Stewart. His promising career ended in December, 1890, with his death from diphtheria, a few days after his twenty-sixth birthday.

J. E. Reece (or Reese) in the autumn of 1866 announced that he was settling permanently in Eyota, Olmsted County, for the practice of his profession. In the *Federal Union* of Rochester, on January 26, 1867, appeared this card: "Dr. J. E. Reece, Eclectic Physician, Eyota, Minnesota, gives constant attention to his profession and particularly to those branches related to all chronic diseases.

He can be summoned from all quarters, far and near. His previous success warrants him in advertising." His notices have not been observed in issues of local publications after October, 1867.

Reginald Maxwell Reynolds (1843-1898), a graduate of Bellevue Hospital Medical College of New York in 1866, came to Rochester, Minnesota, in September, 1867. He has been described as a cultured gentleman of personal charm and a physician of high professional attainments.

Dr. Reynolds was a charter member of the original Olmsted County Medical Society that was founded on April 15, 1868, its first secretary, first chairman of the committee on chemistry, and one of the six members who drew up the society's fee bill.

Within the ensuing year Dr. Reynolds left Rochester temporarily; in February, 1869, he announced his return. He then was making his home at the residence of Z. J. Cowles and occupying the office vacated by Dr. J. S. Allen, a retiring senior physician. On September 8, 1869, Dr. Reynolds was married to Helen A. Cowles, one of the seven children of Zalmon J. Cowles and Sarah Huber Cowles, pioneer residents of Rochester. As mentioned earlier, a sister of Mrs. Reynolds, Kate Cowles, became the wife of the Hon. Joseph A. Leonard, of Rochester; another sister, Frances Kachicqua Cowles, was married to the Hon. Elmer E. Adams, of Fergus Falls.

In April, 1871, Dr. and Mrs. Reynolds removed from Rochester to Dixon, Illinois; a few months later they returned to Rochester, and shortly afterward, in 1871, they settled in Fergus Falls, where Dr. Reynolds for the next twenty-five years successfully practiced his profession. He is believed to have been the first physician in Fergus Falls and perhaps in Otter Tail County. In recent years a facsimile of the log cabin in which he first lived and practiced has been presented to the historical society of that county.

Beginning in 1872 Dr. Reynolds served as a division surgeon for the St. Paul and Pacific Railroad. In reports of the Committee on Epidemics, Climatology and Hygiene of the Minnesota State Medical Society in the early seventies he was quoted as an observer. His name has not been noted on the roster of the society; in 1874 action on his application for membership was deferred because he had not presented his diploma. He was licensed in Minnesota on October 15, 1883, receiving certificate No. 161 (R).

The following is an extract, received through the courtesy of Mr. Elmer E. Adams, from Mason's *History of Otter Tail County:*

> Dr. Reynolds deserves more than a passing notice. He was a man who stood high in his profession; was learned in many branches outside of medicine, and had wonderful literary ability. His girl-like modesty to a great extent kept his light under a bushel, and none but his most intimate acquaintances fully appreciated his great resources. A student all his life, he read the classics as readily as his mother tongue, and could express himself in prose or poetry with remarkable felicity.
>
> He could not make a speech in public any more than a mute; but, sit down with him alone, and he could talk by the hour and it would sound as though he were reading from a book. He had not been here long, surrounded by descendants of the old Vikings, before he could read their language with the best of them, and understand it as though it were his own. Though he was never strong physically, his work was strenuous. The country was sparsely settled and his rides covered a wide territory. In the winter of 1873, at the time of the great blizzard, the echoes of which have not yet died away, he was alone, and no physician to give him aid. Scores were frozen to death and many more crippled for

life. He worked day and night, and performed numberless operations with no assistance except that of a young lawyer by the name of D. P. Hatch, who accompanied him and rendered such aid as he was able to give.

In 1895 Dr. and Mrs. Reynolds left Minnesota for Redlands, California, where the doctor grew oranges. He died in Redlands from cardiac disease in 1898 at the age of fifty-five years, survived by his wife. There were no children. Mrs. Reynolds lived many years after her husband, and her last two years she spent in Fergus Falls and in Rochester. Her death occurred in Rochester.

The name of **Roberts** has appeared in several connections, sometimes erroneously, with the practice of medicine in Olmsted County. The record remains obscure.

In April, 1881, *Dr. D. H. Roberts,* a homeopathist from Underhill, Vermont, opened an office in Eyota, over the general store of Blair Brothers; he was still in practice there a year later. In a gazetteer and business directory of the state the name was given "Dr. H. R. Roberts"; further data about him have not been observed. In 1883 a news item from near-by Dover stated that *Dr. G. W. Roberts,* "father of *Dr. Roberts, Jr.,*" was very low and that all hope had been given up for his recovery.

The Dr. D. H. (or H. R.) Roberts of Eyota is not to be confused with *Dr. Daniel Hough Roberts,* a homeopathic physician (1824-1910), a native of Wayne County, Indiana, who came from Indiana into southern Minnesota about 1869 and who until 1903 made his headquarters in Owatonna. He was a founder of the Southern Minnesota Homoeopathic Medical Society, at Owatonna, in October, 1871, and was active in the affairs of the Minnesota State Homoeopathic Medical Institute. He was not a graduate of a medical school. Eckman, in 1941, in an article on homeopathic and eclectic medicine in Minnesota, reviewed Dr. Robert's life.

It has been said that Dr. Daniel Hough Roberts first and briefly was in Plainview, Wabasha County. Although the statement cannot be disproved, it seems likely that this physician has been confused with *Dr. Francis H. Roberts,* a homeopathic physician who came to Plainview from southeastern Indiana in 1868 and remained there, with the exception of a period in 1887-1889, when he returned to Indiana, until his death. His practice extended widely into Wabasha, Winona and Olmsted Counties. Dr. F. H. Roberts, of Welsh descent, was a graduate, in 1861, of the Western Homeopathic College, in Cleveland, Ohio, and held Minnesota state license No. 1429 (H), issued on May 28, 1887. He is recalled as a cultured gentleman and a reliable practitioner, who made many trips to Cleveland to attend medical lectures, had an excellent library, and subscribed to medical journals, chief among them the *Medical Observer.* Dr. Roberts' wife was the daughter of Dr. Ira Condit Perrine, of Sparta and Moore's Hill, Dearborn County, Indiana. Dr. Ira Condit Perrine was a cousin of Dr. Martin Thompson Perrine, who was the first physician, in 1855, in Rochester, Minnesota. A surviving daughter of Dr. F. H. Roberts is Mrs. Arthur (Mary) Searles of Plainview.

A **Dr. Robertson** from Freeborn County, Minnesota, a graduate of Rush Medical College, opened an office at the A. J. Russell residence in Pleasant Grove, Olmsted County, in April, 1892. He was welcome in the village, which had lacked a resident physician since Dr. Aaron L. Baker removed to Byron in the previous

September. After a few weeks Dr. Robertson also removed, to Waseca, Waseca County, it was said.

There is record in the *Official Register of Physicians of Minnesota* for 1883-1909, that in 1892 J. B. Robertson was graduated from Rush Medical College and in 1893 was licensed in Minnesota; in 1909 he was at Cottonwood, Lyon County.

Harvey Nehemiah Rogers (1837-1926), an eclectic physician and surgeon, was for twenty-one years a pioneer practitioner in southern Minnesota, five years in Oronoco, Olmsted County, and the next sixteen years in Wabasha County; thereafter he spent a few years in Wisconsin, in Whitehall and Chippewa Falls, and the remainder of his long life in Farmington, Dakota County, Minnesota.

A native of Raymond, Racine County, Wisconsin, Harvey N. Rogers was born on June 1, 1837, the son of Reuben Rogers, a farmer, and Sally McNair Rogers. Two brothers of Mrs. Reuben Rogers were physicians, a fact that may have influenced her son in his choice of profession. On his seventeenth birthday his father gave him forty acres of woodland to be cleared for agriculture. The boy was ambitious, however, for education beyond that gained in the district school, and after a few days of felling trees he offered to give back the land if his father would release him to continue his schooling. To outfit himself, he began working for his uncle at Mauston, Wisconsin, painting the barn for twenty-five cents a day. Later he attended Wayland Academy, where he earned his way by doing chores and odd jobs.

At the age of twenty-three years, on September 17, 1860, Harvey N. Rogers was married to Lucy Wright, a native of La Fargeville, New York, who was born on December 23, 1834. There were four children of the marriage, a son, Elliotson H. Rogers, and three daughters, Amarantha, Lutrella and Mabel E. Rogers.

Dr. Rogers received his diploma from the Eclectic Medical College of Pennsylvania, in Philadelphia, in 1864 (sometimes given 1865), and immediately after graduation left for Muncie, Indiana, to begin the practice of medicine. Sudden change in plan took him to Mauston, Wisconsin, where he enlisted in the Union Army. Records of the family show that in June, 1865, he was stationed near Greensboro, North Carolina, where he was assistant surgeon in the 177th Volunteer Regiment of Infantry, Second Brigade, Third Division, Twenty-third Army Corps.

In July, 1865, having been mustered out of the army, Dr. Rogers settled in Oronoco, Olmsted County, Minnesota. He was the only physician in the village, succeeding Dr. Hector Galloway, who had removed to Rochester, and occupying the Galloway residence on the south bank of the Zumbro River. The *Rochester Republican* of August 16, 1865, in announcing the doctor's arrival, said "The doctor's advent supplies a want much felt by the citizens of Oronoco, as no physician was to be had nearer than Rochester." On September 13 that newspaper reported, "Dr. H. N. Rogers wants a medical student. A young man who has the right material in him and wants to study medicine will find an extra good chance with Dr. Rogers."

In July, 1870, Dr. Rogers removed from Oronoco to Lake City, where he practiced medicine for a year. There Lucy Wright Rogers died and was buried in Lakewood Cemetery. Soon afterward with his four young children Dr. Rogers settled on a farm in section 20 of Guilford Township, Wabasha County, about two and a half miles northeast of Zumbro Falls and practiced medicine in the community. After the death of his first wife he was twice married: on February

18, 1872, to Mary E. Conway, who died in 1903; and some time after her death to Lydia Berry. There were no children of these marriages.

In 1886, it is said, Dr. Rogers removed to Whitehall, Wisconsin, and subsequently to Chippewa Falls, that state, as noted, and a few years later to Farmington, Minnesota. On May 28, 1914, the citizens of Farmington showed their esteem for Dr. Rogers and their appreciation of his services by tendering him a banquet celebrating his fiftieth year of medical practice. Tribute was paid Dr. Rogers as educator, citizen, friend, and neighbor; there was a toast, "The Doctor and the Family" and, last, "Half a Century of Medicine."

Dr. Rogers died at his home in Farmington on September 8, 1926, survived by his wife, Lydia Berry Rogers, and his three daughters, Mrs. A. B. Boyce, of Farmington, Mrs. Lutrella R. Wilson, of Chicago, and Mabel E. Rogers, of Oak Park, Illinois. His son, Dr. E. H. Rogers, of Stevens Point, Wisconsin, preceded him in death on August 30, 1926.

Dr. Rogers' daughter, Mrs. Boyce, has stated that among her father's old papers is his certificate, in Latin, from the Southern Minnesota Eclectic Medical Association. (This society was incorporated on November 14, 1869.) Under the Minnesota "Diploma Law" of 1883 Dr. Rogers held certificate No. 909 (E), dated May 9, 1884. Further record appears in the following extract from a report of the sixty-sixth annual meeting of the Wabasha County Medical Society at Lake City on July 5, 1934: "A resolution was passed providing for the proper marking of the grave of Dr. Rogers, a pioneer physician in the county, one of the charter members of the Wabasha County Medical Society, at one time a practitioner in Lake City, a veteran of the Civil War, who died at Farmington, in 1926, and whose body now lies buried in Lakewood Cemetery, Lake City."

E. M. Roys was the third woman physician to practice in Rochester, Minnesota, it is believed, and perhaps was the first woman practitioner in the city who was a member of the regular profession. Of her predecessors one was a "magnetic healer" and the other described herself as an eclectic physician who treated all chronic diseases with electricity.

Dr. Roys' professional card appeared in the *Rochester Post* at intervals from January 11, 1868, to May 9, 1869; her office first was in Graham's Block and later in Head's Building. She was listed in *Mervin's Business Directory* of 1869-1870. On July 17, 1871, the *Central Record* of Rochester carried the following item: "Miss E. M. Roys, M.D., is about to be married and move to England to live. Miss Roys will be remembered as an old resident of this city and a practicing physician of rare merit, beloved by all who knew her. May she be happy in her new situation."

The name of Dr. Roys did not appear on the roster of the Olmsted County Medical Society, organized on April 15, 1868.

Herman Richard Russell (1871-1929) for thirty-three years was a physician and surgeon, twenty-four years in Stewartville, in his native Olmsted County, and nine years in St. Paul.

Born on June 10, 1871, in Pleasant Grove, he was the only child of Charles W. Russell and Martha J. Lovelace Russell, both of whom were born in Pennsylvania, and was a grandson of Richard S. Russell, a native of England, who came as a young man to the United States.

Richard S. Russell lived first in New York, later in Pennsylvania, and in 1856 came to Minnesota and settled with his wife and children on a farm in Pleasant Grove Township, Olmsted County, where he and his family became representative citizens. The children were: Caroline (Mrs. Fred.) Russell, Charles W., Mary (Mrs. Frank) Denny, Arthur James, Emmeline (Mrs. Edwin) Dorr, Richard Venango, Ross Henry and Nell (Mrs. Hugh) Neill. Of these children Richard Venango Russell, of Stewartville and Rochester, became widely known in southern Minnesota. A handsome man, finely built, more than six feet in height, of dignified presence, in his later years he wore his gray hair long and had chin whiskers: He bore a striking resemblance to the well-known pictures of the nation's "Uncle Sam" and because of this for many years was much in demand in the southern counties and in the Twin Cities to lead patriotic parades. Charles W. Russell, eldest son of Richard S. Russell, was the only member of the family old enough to serve in the Civil War; in 1862, just under eighteen years old, he was accompanied by his father when he went to enlist in Company H, Sixth Minnesota Volunteer Regiment of Infantry. After his military discharge at the end of three years he was a merchant in Pleasant Grove. He spent his last years in Stewartville, where he died on March 17, 1927.

Herman R. Russell received his early education in the village school of Pleasant Grove and at Darling's Business College of Rochester. After teaching school two years in Pleasant Grove, he matriculated, in the autumn of 1895, at the College of Physicians and Surgeons (after May 1, 1900, the College of Medicine, University of Illinois), in Chicago, for a course of four years. In 1898, still an undergraduate, he was licensed to practice medicine in Minnesota. In July, 1899, shortly after graduation with the degree of doctor of medicine, Dr. Russell began in Stewartville a practice that was interrupted only once, when for a few months in 1900 he served as locum tenens for his brother-in-law, Dr. Patrick H. Manion (a native of Olmsted County), of Charlotte, Iowa, while Dr. Manion was on an official mission of scientific study in Europe.

In Stewartville Dr. Russell had his offices successively in the Moore Block, the Davis Block, and in rooms connected with the Stoddard Drug Store. In the summer of 1922 he removed to St. Paul, where he had headquarters in the Pioneer Building, later in the Lowry Building, and at 608 South Smith Street. His residence was in Cherokee Heights, St. Paul. He built up a large practice and won an enviable place in the medical profession of the Twin Cities.

Throughout his career Dr. Russell was active in representative medical organizations: the Olmsted County Medical Society, the Southern Minnesota Medical Association, the Minnesota State Medical Association, the American Medical Association and the Ramsey County Medical Society. He kept abreast of his profession by reading, frequent clinical trips and postgraduate courses. After 1907 he began to give special attention to ophthalmology, otology, laryngology and rhinology and, after 1922, to urology.

A handsome, kindly, genial man, well trained and responsible, Dr. Russell as physician and citizen held the respect and regard of the communities in which he lived. In Stewartville he was for several years a member of the board of education, was president of the village council, and served a term as mayor. He was a member of the Masonic Lodge of Stewartville and of the Shrine of St. Paul and of Chicago. A reader of the best in literature, he held intelligent opinions on the wide range of subjects in which he was interested and was an entertaining conversationalist. His recreations were raising flowers and fishing; in his later years he became interested in raising guppies and other tropical aquarium fish, and locally was recognized as an authority on the subject.

Herman R. Russell was first married on June 11, 1900, to Hannah Lucille Manion, one of the eight children of Mr. and Mrs. Owen Manion, of Eyota, pioneer Irish citizens of Olmsted County. Mrs. Russell, an able educator, had been a teacher in the Stewartville schools. There were two children of the marriage, Patrice and Owen. Mrs. Russell died in Cherokee Hights on December 2, 1926. Dr. Russell's second marriage, on February 14, 1929, was to Martha S. Schumann, a trained nurse, a graduate of St. Mary's Hospital School of Nurses Training, in Rochester, and one of the eight children of Mr. and Mrs. Adolph Schumann, natives of Germany, who from 1884 were well-known citizens of Stewartville and community.

On June 29, 1932, at the age of sixty-one years, Herman R. Russell died at St. Luke's Hospital, St. Paul, after a short illness from cardiac disease. Burial was in Acacia Park Masonic Cemetery at Pilot Mound, St. Paul. He was survived by his wife, his son and his daughter, Mrs. John Lindamann, both of Minneapolis, and his mother, who was a member of his household; Mrs. C. W. Russell died in Cherokee Heights on May 17, 1935. In 1947 Mrs. H. R. Russell continued to make her home in Cherokee Heights, Mrs. Lindamann was in Minneapolis, and Owen Russell in California.

Reuben Nathaniel Sackett (1825-1920), a man of fine character, a member of the regular school of medicine, it is said, and one of the first three physicians of Olmsted County, settled at Quincy Mills, Quincy Township, in May, 1855. His Christian names and their initials have appeared variously: Reuben Nathaniel, R. N., Nathaniel R., Reuben, and Nathaniel. In the writer's article on early decades of medicine in Fillmore County, notes on Dr. Sackett appeared in a biographical sketch of his son, Dr. Jay Le Roy Sackett (1858?-1890), who served his brief professional career in Lenora. The essential data about Dr. R. N. Sackett are repeated here.

Reuben N. Sackett was born on December 8, 1825, in Chautauqua County, New York. He obtained his general education and his medical training in his native state and began his medical practice in Syracuse. In May, 1855, as stated, he settled in Olmsted County, Minnesota, accompanied by his wife, Julia A. Palmer Sackett, to whom he was married in New York State on August 11, 1854. In Quincy Mills and a widespread surrounding community Dr. Sackett experienced the arduous medical and surgical practice of the time, giving faithful and generous service to the scattered pioneer families. Between 1865 and 1868 he was resident in near-by St. Charles, Winona County; for a short time thereafter in Chatfield, Fillmore County; and subsequently for many years, first in Windom, Cottonwood County, and second in Janesville, Waseca County (as late as 1909). Dr. Sackett was active in the Masonic order and as a charter member helped to organize lodges at St. Charles, Windom and Janesville. For more than seventy years he and his wife were supporting members of the Methodist Episcopal Church.

Dr. and Mrs. Sackett were the parents of three children, born at Quincy Mills: Nettie became the wife of A. G. Chapman, a lawyer of Lanesboro; a son of Mr. and Mrs. Chapman was the late C. A. Chapman, a banker of Rochester; a surviving daughter (1946) was Mrs. B. J. Morey, of Lanesboro. Jay Le Roy Sackett, M.D., died early in his career; Zilpha Estell died in infancy.

This pioneer physician and his wife spent their last years with their daughter in Lanesboro. Julia Palmer Sackett died on November 21, 1914; Reuben Nathaniel Sackett, on December 20, 1920, at the age of ninety-five years, from the infirmities of age. Their graves are in the Lanesboro Cemetery.

Orin W. Sadler (1843-1929), who was born at Waukegan, Illinois, was the son of Mr. and Mrs. William Dexter Sadler. He was graduated from the Chicago Medical College in 1868 and probably in the same year began his initial practice in southern Minnesota. Eckman and Bigelow, in their article on the history of medicine in Dodge County, included him, as of West Concord, in their roster of pioneer physicians. Although Dr. Sadler lived for a considerable time in Dodge County and is known to have practiced in Wabasha, Wabasha County, and in Winona, Winona County, it has been established, on information from his niece, Mrs. J. A. Fiegel, of Rochester, that for a period he had his home in Byron, Olmsted County, and that during all his seven years in Minnesota he practiced to some extent in this county. Mrs. Fiegel was Ella Mary Vosburgh, whose parents, John Sharon Vosburgh and Mary Belinda Sadler Vosburgh, a sister of Orin W. Sadler, came by wagon from Wisconsin to Winona County, Minnesota, and thence, in 1856, to Salem Corners, Olmsted County.

Dr. Sadler was the first physician in Dodge County to become a member of the Minnesota State Medical Society, elected to membership at a session in Owatonna in 1869; his name remained on the roster through 1875. Once, at least, he assisted the Drs. Cross of Rochester in a surgical operation; he consulted with Drs. Garver and Willson of Dodge County in a case of insanity; and was a county physician in Dodge County.

He was married about 1870 to Emma Josephine Slocum, of Mantorville, Dodge County, a daughter of George W. Slocum and Rhoda C. Mantor Slocum, and a sister of Dr. Julius Franklin Slocum, who served his honorable but brief professional career in Marion, Olmsted County, in the early seventies. Dr. and Mrs. Sadler had four children, George, who died in infancy at Mantorville, Lucy, Orin and Samuel.

When Dr. Sadler left Minnesota early in 1875, he settled in Philadelphia, where he practiced into 1890; he was licensed in Pennsylvania in 1881. From 1890 until after 1907 he was in Pittsburgh; for the next few years in Johnstown. From 1913 for about twelve years he was resident in Mt. Dora, Florida, and briefly thereafter in Tarpon Springs. Dr. and Mrs. Sadler occasionally returned on visits to Minnesota: in 1875 in Mantorville, where the doctor, "an eminent oculist," at the Bradley House performed operations for crossed eyes, and again in 1879. In 1890 Mrs. Sadler with one child came to Mantorville and in 1894 with the three children she visited at the Fiegel home in Salem Township. After her death, in the early nineteen hundreds, it is believed, Dr. Sadler remarried; in 1916, accompanied by his wife, he visited in Rochester.

Dr. Sadler died of arteriosclerosis in Tarpon Springs, Florida, on January 2, 1929, at the age of eighty-five years, survived by his wife (who died in 1940) and his children. His son Orin, it is said, was a physician.

(To be continued in the July issue.)

President's Letter

THE ANNUAL MEETING, 1951

IN RETROSPECT, one has the feeling that the annual meeting of the Minnesota State Medical Association this year was an unqualified success. This was made possible in great part by the fine functioning of the various committees on arrangements, program, et cetera. Everything went on well and according to schedule. The Executive Secretary and his corps had everything under control and contributed very much toward making the meeting run smoothly. The meetings were well attended and the various addresses and demonstrations were excellent. The round table discussions were especially fine this year, from the point of view of teaching and discussion. Registrations were high, and many physicians from outside the state were present.

A very happy circumstance, always, is the renewal of friendships between physicians and former teachers, and between the members of the different classes. Many new acquaintances are made and old friendships renewed. It would seem that this is good, as it favors a united body of members of the profession. A dinner meeting of members of Minnesota Medical Foundation, Minnesota Medical Alumni, was well attended. Such meetings will continue to be held at the time of the State Medical meeting. The various specialty groups had their separate sectional meetings.

An outstanding number on the program, among other excellent numbers, was the symposium on new drugs—particularly the discussions on ACTH and cortisone. At the banquet, the members of the profession were very happy to hear the informative discussion presented by Dr. John W. Cline, San Francisco, California, President-elect of the American Medical Association.

The city of Rochester has one characteristic which should be mentioned—the universal spirit of helpfulness everywhere, whether in hotel, store, or the citizen on the street. This smiling courtesy helped to make the visit of the Association a pleasant one to be remembered.

We shall look forward to seeing you in Minneapolis next year.

J. F. Norman

President, Minnesota State Medical Association

CHOLESTEROL AND ATHEROSCLEROSIS

FOR MANY YEARS it has been known that cholesterol is one of the substances in atheromatous plaques of sclerotic arteries. While the physiology and pathology of cholesterol metabolism is not thoroughly understood, some facts are known. Cholesterol is an essential constitutent of body cells and fluids. It has an extrinsic origin from ingested animal fat (meat fat, egg yolk, butter, cream, etc.). It also is formed intrinsically in the liver, is a component of bile and facilitates the absorption of fatty acids.

Cholesterol is a normal constitutent of the blood. Its level in the blood is fairly constant for the individual but has a tendency to be slightly higher as age advances. It is higher in uncontrolled diabetes, obstructive jaundice, hypothyroidism and nephrosis and is reduced in severe liver disease, hyperthyroidism and certain febrile diseases.

It has also been known for many years that cholesterol feeding of rabbits will produce a hypercholesteremia and atherosclerosis. A natural conclusion was that the excessive ingestion of fat might be the cause of atherosclerosis in man, not laying much emphasis on the fact that the rabbit is herbivorous and cholesterol feeding does not produce hypercholesteremia or atherosclerosis in carnivorous animals. Man is omnivorous and there is little reason to infer that he will react like a herbivorous animal in this respect. But does he?

Reports are conflicting. Some have found that enormous amounts of ingested cholesterol results in only slight elevation of the serum cholesterol, most of it being eliminated in the stool. An automatic adjustment whereby when much cholesterol is available in the food, less is manufactured by the liver, has been reported. Keys has found little correlation between the cholesterol ingested and cholesterol blood levels. However on cholesterol-free and fat-free diets, steady and rapid decline in serum cholesterol was consistently noted. In one patient on a cholesterol- and fat-free diet the addition of vegetable fat raised the serum cholesterol to previous heights. This suggests that cholesterol can be formed from other than animal fat, which is contrary to the general opinion. Further, many individuals with hypercholesteremia fail to show signs of atherosclerosis and likewise many with atherosclerosis fail to have an elevated serum cholesterol. Reports of cholesterol levels in the blood in individuals with coronary disease are not consistent. Those with histories of recent coronary infarction fail to present elevated blood cholesterol consistently.

Gofman who has interested himself in this relationship between fat and cholesterol in the diet and atherosclerosis explains this inconsistency in this way. By means of ultracentrifugation of blood he has studied quantitatively the entire spectrum of lipid and lipoprotein components in the serum. One layer of the lipoprotein molecule he finds consistently increased in recent coronary thrombosis and in those likely to suffer from a coronary attack. Moderate reduction of the fat and cholesterol in the diet is reflected by this test whereas the cholesterol level is not consistently lowered as recorded by the usual tests. This justifies his belief that a moderate reduction in the fat and cholesterol in the diet is effective in the treatment of atherosclerosis and that a total elimination of fat and cholesterol in the diet is not essential.

It seems essential that Gofman's tests with the ultracentrifugation of blood should be checked. Gofman's reports, along with the reasonableness of the recommendation of a reduction in animal fat as a preventive of atherosclerosis, has led many physicians to recommend the reduction or elimination of this type of fat and cholesterol in the diet. A most complete book of instructions for patients and diets has appeared.* All this may be a bit premature. It is well known, however, that in China, Costa Rica and Okinawa where the diets are largely vegetable, little atherosclerosis exists. Life insurance companies know the hazard of overweight. A reduction in overweight at any age is good advice. The question however has not been settled whether a moderate reduction of fat in the diet is sufficient or whether a vegetarian diet is necessary to reduce the elements in the blood that are responsible for atherosclerosis and its dire consequences.

---

*Dobbin, E. Virginia; Gofman, Helen F.; Jones, Helen C.; Lyon, Lenore and Young, Clara-Beth: The low fat, low cholesterol diet. New York: Doubleday and Company, 1951.

The part choline administration will assume in the treatment of atherosclerosis remains to be established. It has been shown to be of value in slowing and reversing the atheromatous process produced in rabbits. Investigators have reported an improved mortality in coronary thrombosis patients by the administration of choline. Choline and a reduction in animal fats in the diet seem to be the best the profession has at present to offer in the treatment of atherosclerosis. Time will establish the value of the offering.

FINANCIAL RELIEF FOR MEDICAL SCHOOLS

THE COMMISSION on Financing Higher Education is an independent body sponsored by the Association of American Universities and financed by grants from the Rockefeller Foundation and the Carnegie Corporation. It is engaged in a long-range study of the financial problems of American colleges and universities. A statement put out by the Commission on May 16, 1951, on the subject of Financing Medical Education is succinct and to the point. The Commission does not favor federal subsidy of higher education in our country. If medical education should be directly subsidized there is every reason why other educational programs might also wish or demand support. The Commission believes "such a course would be dangerous to the intellectual heritage of freedom and diversity which characterizes American higher education." We agree.

The medical schools, however, are facing a critical financial problem. About an equal number of the seventy-two four-year medical schools of the country are units of public and private universities. The medical school has the most expensive course per student in any university.

The Commission, in its recent report, has offered certain suggestions to meet the present financial dilemma. It does not believe that an increase in tuition should be made. The tuition is already the highest of any undergraduate or postgraduate department. The medical course, too, is the longest in all professional schools, which makes the medical course by far the most expensive of all departments. The Commission believes that certain economies may well be practiced in medical schools. It mentions too many courses, overlapping of courses and duplication of effort. We have thought for some time that the present-day medical course contains instruction that might well be deferred for the training of specialists. Inasmuch as accredited medical schools must operate with a teaching hospital and clinical facilities, medical instructional budgets often have a large amount of community service costs hidden within them. On the other hand, to our knowledge medical schools are in some instances relieved of expense by the contribution of clinical material and staff gratis by city hospitals. City hospitals, too, in some instances pay interns and residents while they are technically enrolled in a medical school. The Commission calls attention to the high cost of medical research. Some foundations and corporations which contribute funds for research fail to provide for the indirect costs of the research which only add to the budget of the medical school.

Even if all the suggested economies and adjustments are made, the medical schools still will need help and a lot of it. The seventy-two medical schools required 70 million dollars to operate in 1950. It is estimated they need an additional 10 million a year to continue operating on their present basis.

As mentioned in an editorial which appeared in our January issue, the AMA House of Delegates at Cleveland last December approved the appropriation of $500,000 to establish the American Medical Education Foundation for the support of the medical schools. The California State Medical Association added $100,000 and the members of the profession were invited, yes urged, to contribute $100 per member. If every physician contributed his $100, some 18 million dollars would be raised and the problem solved. Pitifully few Minnesota doctors made a contribution. Doubtless, most felt the futility of the doctors of the country attempting to contribute a fund sufficient to maintain the medical schools in the black. The medical schools would need financial assistance from a wider field than just the medical profession. This has now happened. A National Fund for Medical Education has been established with the sponsorship of industry, organized labor, agriculture, a group of university presidents, twelve scientific and educational foundations, as well as the medical profession. The goal for 1951 is 5 million dollars, one million of which has already been collected. Contributions to the American Medical Education Foundation are to be funneled to this new National Fund for Medical Education. Those of us who can possibly afford to make a contribution of $100, or even less, should do so. Contributions should be sent to the American Medical Education Foundation at AMA headquarters. Any contributions are deductible from Federal income tax returns.

BARUCH COMMITTEE TERMINATED

THAT MONEY can be the means of accomplishing much good is illustrated by the accomplishment of the Baruch Committee on Physical Medicine and Rehabilitation. The committee was established by Bernard M. Baruch of New York City to develop the field of medicine devoted to the diagnosis and treatment of disease by physical means and to the rehabilitation of disabled persons. Mr. Baruch has donated over 2 million dollars personally to the support of this branch of healing in honor of his father, the late Dr. Simon Baruch, who was the leading medical pioneer in this field.

As a result of the activities of this committee, there has been a marked increase in the teaching of physical medicine in the medical schools of the country; there has been a great increase in the number of residencies in physical medicine in the hospitals; thousands of wounded soldiers and sailors as well a injured civilians have been rehabilitated; a new Section on Physical Medicine and Rehabilitation has been formed in the AMA; the American Board of Physical Medicine and Rehabilitation to certify specialists in this field has been established.

Dr. Ray Lyman Wilbur provided remarkable leadership in the organization of the work of the committee until his death in June, 1949. Dr. Frank H. Krusen of Rochester, who has been carrying on in Dr. Wilbur's place, announced last month that the committee has achieved its goal and is discontinuing its activities. The committee is dead. Long will live the results of its existence.

NATIONAL DOCTORS COMMITTEE FOR IMPROVED FEDERAL MEDICAL SERVICE

DR. ROBERT COLLIER PAGE is chairman of the National Doctors Committee for Improved Federal Medical Service. An advisory committee of experts from every branch of the medical profession has been appointed to consult with the chairman of the committee on matters of policy. Dr. Page is the Medical Director of Standard Oil Company of New Jersey.

The National Doctors Committee is an affiliate of the Citizens Committee for the Hoover Report which is urging the passage of the recommendations of the bipartisan Hoover Commission for the unification of the various governmental medical agencies under a single authority. The slogan of the Doctors Committee is: "Not more government in medicine but better medicine in government." Economy is one of the main objectives of the committee.

It will be recollected that the task force of the Hoover Committee recommended that federal governmental medical activities, except the army and navy hospitals, be organized as one unit with a trained medical man at the head holding a cabinet position; and that this branch of the federal government be not combined with the Department of Social Security and Education with a layman at the head as urged and almost accomplished by Oscar Ewing.

The saving in Federal spending which would be accomplished by the unification of these governmental medical activities would be considerable.

When the use of anesthetics was first introduced in England, the clergy, almost without exception, denounced it, saying the Lord wanted us to suffer and doctors had no right to make patients unconscious and free from pain. A young Scotch doctor advised clergymen to read in Genesis how "The Lord caused a deep sleep to fall upon Adam" before he took out his rib.

AMA PRESIDENT SCORES AGAINST EWING

A few well-chosen, forceful words were aimed recently at Oscar Ewing by AMA president, Dr. Elmer Henderson. Dr. Henderson expressed the view of American doctors, and went on to repudiate Ewing's statements with such adeptness that it is doubtful whether the Federal Security Agency will ever attempt a similar tactic.

Dr. Henderson had quoted a "current" FSA pamphlet which said:

> "Social security and public assistance programs are a basic essential for attainment of the socialized state envisaged in democratic ideology, a way of life which so far has been realized only in slight measure."

Speaking for the Federal Security Agency, and characteristically hedging to avoid the issue, Ewing denied the currency of the pamphlet:

> ". . . Elementary check would have revealed that pamphlet was written and issued in 1945, some two years before I became Federal Security Administrator. Checking would also have revealed that this pamphlet is not being currently distributed by Federal Security Agency, and has never had remotest authority as directive."

Actual proof of the pamphlet's currency was then presented by Dr. Henderson, with appropriate comments as an added flourish:

> "We note your denial of responsibility for the pamphlet on the grounds that it was published in 1945 before your tenure as administrator of that office. This denial, as you request, will be duly reported in The Journal. You are correct in assuming that as a reputable scientific periodical it is the habit of this journal to verify statements before publication. The facts concerning my reference are these.
>
> "The pamphlet in question was reprinted for distribution by your office in 1949, when the public record indicates you were in charge of the Federal Security Agency, its publications and its directives to employes. Five copies were received in the mail here last week, which indicates certain currency still. These all carry the imprint, 'Government Printing Office, 1949.' The fact that the report was first printed in 1945 would not seem to alter the further fact that you apparently have thought well enough of it to have it reprinted in 1949."

Ewing had prematurely requested *The Journal of the American Medical Association* to retract its quotation from the FSA pamphlet, "as publicly as it was made in the first place." After proving himself correct, and publicly telling Mr. Ewing so, Dr. Henderson went on to give Ewing some well-deserved advice:

> "We would suggest that if you wish at this time to disavow the principles expressed in the pamphlet, you will wish to do so in a formal statement to Congress, for as recently as February 26 of this year, it was protested on the floor of Congress as grave misuse of taxpayers' money to disseminate wholly un-American philosophies."

A final jab at Ewing and his flagrant denial of fact, is taken by Dr. Henderson:

> "In case it was without your knowledge that your office was reprinting and distributing such un-American directives during your tenure, you may wish to issue a public statement disclaiming responsibility for the material. If so, we shall certainly be glad to be helpful in giving such a statement further distribution through The Journal, for the medical profession will be sincerely interested in any such action."

NEW FUND PLAN TO AID MEDICAL SCHOOLS

Financial assistance for all the nation's hard-pressed medical schools was promised recently in the establishment of the National Fund for Medical Education. The Fund, representing the culmination of two years of planning and organization, has the sponsorship of industry, the medical profession, organized labor, agriculture, a group of university presidents and twelve scientific and educational foundations.

The Fund has more than $1,000,000 to start it on its $5,000,000 goal for the first year. The American Medical Education Foundation, begun by the American Medical Association last December, will funnel all its contributions from doctors through the new organization. The National Fund plans to make these and other grants available immediately to the nation's medical schools.

Already machinery is set up to distribute the money equitably among the medical schools of the country. Guidance was gained by the Fund's Advisory Council, including university presidents, representatives of the AMA, the Association of American Medical Colleges and medical directors of leading philanthropic foundations.

Although no one claims that provision of $5,000,000 annually will completely solve the budgetary problems of America's fine medical schools, there is, at the same time, a feeling that the National Fund represents concerted efforts of a group of Americans earnestly trying to solve a problem that they know will affect this country in many ways. Chief objective of the Fund is to seek voluntary contributions—a characteristic American way of doing things.

In announcing the plan at the sponsoring group's annual meeting, S. Sloan Colt, Fund president, said, "What is most gratifying and significant is the fact that this vital project has brought together as trustees a broadly representative group of men and women. Those who organized the Fund may have differing social viewpoints but, insofar as the Fund is concerned, we have united in an endeavor to solve a serious problem for the common good. Unless the medical schools are given financial help, and given it quickly, the standards of medicine may be permanently impaired and the nation's health affected adversely."

BRITISH HEALTH SERVICE HEADS TOWARD BANKRUPTCY

Full-fledged bankruptcy of the British Health Service is now clearly and coldly foreseen by the British Medical association. Many people in a position to observe the situation objectively have wondered why bankruptcy has not come sooner. Expressing discontent and disillusionment, a recent *British Medical Journal* says:

> "The medical profession is discontented and disillusioned, not because of payment, or lack of it, for this or that, but because it sees postponed indefinitely the opportunities for improving the medical care of people. . . ."

Through all its struggling to maintain high medical standards under a hopelessly inefficient system, the British medical profession has not lost sight of its basic principle—improving medical services to the people—but realization of this goal is receding fast, under the pressure of a top-heavy, structurally unsound program of medical care.

The editorial in the *British Medical Journal* explains to its readers the main reasons for failure of the medical scheme:

> "Not only are we facing bankruptcy because of the Utopian finances of the Welfare State. We are, as a profession, facing the bankruptcy of a policy based on the decisions of the Coalition Government during a war for survival and put into execution by a Minister of Health who could not resist the temptation to behave like a Fairy Godmother to an impoverished nation. . . .
>
> "The honeymoon period of the Welfare State is over. The uneasy marriage between the medical profession and the State is now undergoing the strains of an unbalanced domestic economy . . . the public has run riot in the chemist's shop—at what a cost it is only just beginning to discover. The shocking waste of public money over the inessentials of medicine has left little over for what is more urgently needed. . . ."

ASSOCIATION SETS UP RURAL MEDICAL SCHOLARSHIP

A rural medical student scholarship, designed to promote even better distribution of physicians throughout the state, was approved by the House of Delegates of the Minnesota State Medical Association at the annual meeting in Rochester, April 30, May 1 and 2.

Dr. F. J. Elias, Duluth, chairman of the Committee on University Relations, submitted the plan to the delegates. He presented the purpose of such a scholarship as follows:

> "In the first place, it is the distinct effort on the part of organized medicine to solve one immediate, fundamental social problem, the distribution of physicians. This primary purpose is to be accomplished by providing financial aid in the form of a scholarship to at least one new medical student a year, who agrees to engage in general practice in a town of 5,000 population or less for a period of at least five years."

The new plan provides $1,000 a year for four years to a beginning medical student from a small town or rural area. Eligibility depends on three factors: financial need; residence in a rural area or town of less than 5,000 population; and an agreement to engage in general practice in a town of the student's selection from a list furnished by the state medical association and the Minnesota State Board of Medical Examiners.

Minneapolis Surgical Society

Meeting of October 5, 1950

The President, Harvey Nelson, M.D., in the Chair

PRIMARY OSTEOTOMY FOR THE TREATMENT OF INTRACAPSULAR FRACTURE OF THE NECK OF THE FEMUR

MAYNARD C. NELSON, M.D.
Minneapolis, Minnesota

The all too frequent occurrence of non-union of intracapsular fractures of the neck of the femur is well known. In reviewing these fractures at the Minneapolis General Hospital, we were impressed by the number of patients with non-union, even though their fractures in a majority of cases had been accurately reduced and internally fixed properly. Because of this and because of the frequent necessity of multiple operations to obtain a stable hip, we began to wonder if our initial approach to the problem was correct. It was thought that perhaps some procedure combining the advantages of internal fixation and those of secondary operations for non-union could be used to advantage in the treatment of fresh intracapsular fractures. Therefore the different operative procedures devised for the treatment or prevention of non-union of intracapsular fractures were investigated. The chief aims of these procedures are to restore stability to the hip, to diminish pain, and to restore a variable degree of muscular control about the hip joint.

Whitman[15] recommended his reconstruction operation for the treatment of ununited intracapsular fractures with considerable neck absorption. The head of the femur is removed and the greater trochanter with its attached muscles is cut off obliquely. The stump of the neck thus created is placed into the acetabulum and the limb is abducted twenty-five degrees. The trochanter is then secured more distally on the lateral aspect of the femur to restore the normal distance between the origin and insertion of the abductor muscles. A hip spica is used.

Albee[1] cited non-union and aseptic necrosis of the head as indications for the use of his reconstruction operation. As in the Whitman operation the head is removed and the neck stump placed into the acetabulum. A bone-muscle lever about four inches long is then cut from the trochanter and upper femoral shaft to restore ability to abduct the hip. Here again a hip spica is used.

Colonna[5] listed non-union with complete absorption of the neck as the indication for use of his reconstruction operation. The head of the femur is removed and the muscles inserting on the greater trochanter are severed close to the bone. Then the greater trochanter is placed into the acetabulum and the severed abductor muscles are fastened distally on the femur. Here too a spica cast is used.

The Brackett[3] operation is recommended for use in treating cases of non-union with almost complete absorption of the neck and with aseptic necrosis of the head. In this operation the neck stump is rounded off and placed into the scooped out head. The abductor muscles with a shell of bone are severed from the greater trochanter and reimplanted distally on the femur. As in the previous procedures a hip spica is used.

Use of the Luck[9] reconstruction operation is contraindicated when there is a dead or disintegrated head or when disabling arthritic changes are present in the hip joint. In this procedure the femur is cut transversely at the level of the lower border of the neck; the fracture surface of the head is freshened; and the head is then placed on top of the denuded upper femoral shaft. The trochanter with its attached muscles is placed lower on the lateral aspect of the femoral shaft and a Steinman pin inserted through the trochanter and shaft into the head. If this fixation is not secure, a plaster spica is applied.

The osteotomy of von Baeyer[14] and Lorenz[8] is of the linear type (bifurcation). The cut begins low on the lateral aspect of the femur and ends medially above. It is situated entirely below the lesser trochanter. The lower femoral fragment is then forced up against the acetabulum and the two sections of the femur approximated by abduction of the extremity. Stability of the hip is restored by the pelvic support obtained through the medial bony spur and power of abduction is regained through increased tension of the gluteal muscles.

The osteotomy described by McMurray[10] is an oblique or linear osteotomy which begins laterally at the level of the lower margin of the lesser trochanter and extends upwards and medially to end at the level of the upper margin of the lesser trochanter. After the cut is made the leg is abducted and the femoral shaft displaced medially under the head. Because of muscle attachments common to both osteotomy segments, this medial shift of the distal fragment produces adduction-rotation of the proximal fragment. A more horizontal fracture plane with diminution of shearing force results. A plaster hip spica is used for immobilization. Because old ununited femoral neck fractures were treated by this method with a high degree of success, McMurray[11] and Murphy[12] used it for the treatment of fresh intracapsular fractures.

The cervical-axial osteotomy of Leadbetter[6] differs from the McMurray procedure in that the osteotomy is made within the capsule of the hip joint at the junction of the middle and lower thirds of the long axis of the neck. Posterior displacement of the distal fragment is thereby prevented. After the bone is sectioned, the femur is then forced medially and the head rotated so as to lie with its fracture surface on the freshly cut neck. A plaster hip spica is used for immobilization.

The Blount[2] osteotomy is similar to the McMurray procedure except that it is done at the level of the lesser trochanter to allow more adduction rotation of the proximal fragment. The distal fragment is not completely displaced medially. The osteotomy is fixed by means of a blade-plate to obviate the necessity of using a cast.

Pauwels,[13] in 1929, described a wedging type of osteotomy based on the results of his studies of the various forces of pressure, shearing and tension that exist at a fracture site in the neck of the femur. A vertical force exerted on the head of the femur in a femoral neck fracture was thought by Pauwels to be divided into a pressure and a shearing component. He felt that the course of healing of the fracture is determined by which of these forces predominates and showed that shearing force first becomes effective when the fracture is more than 30 degrees off the horizontal plane. As the angle increases, the pressure component decreases and shearing effect increases. The wedge, in Pauwels' operation, is removed just below the lesser trochanter and is of sufficient size to reduce the fracture angle to less than 30 degrees off the horizontal plane.

Camitz,[4] in 1931, recommended the use of an osteotomy with a wedge, two centimeters wide at its base, removed at the level of the lesser trochanter for the treatment of non-union. Linton,[7] between 1939 and 1941, performed wedge osteotomies on four cases of recent intracapsular fractures in which the prognosis for healing was considered bad due to pronounced obliquity of the fracture plane. Linton is the first author on record to recommend the use of wedging osteotomy combined with internal fixation of the fracture site. He advocated a Smith-Petersen nail for this purpose. However, both he and Camitz used spica casts for immobilization.

After investigating the above procedures, it was felt that perhaps internal fixation of the fracture combined with a wedging type of osteotomy (described by Pauwels,[13] used as a primary procedure by Linton,[7] and used by Moe for non-union) would be most likely to accomplish our aim to find a single procedure which could be used for the treatment of fresh intracapsular fractures of the femur and which might result more frequently in primary union. With the hope that this theory might be proved, the first of a series of fifty-two of these procedures was carried out at the Minneapolis General Hospital on October 1, 1946. This was done by Dr. Frank J. Ankner, senior resident in surgery at the Minneapolis General Hospital. Dr. Ankner also either performed or personally supervised the great majority of these operations as partial fulfillment of the requirements for his Ph.D. thesis.

Discussion of the Proposed Osteotomy

In selecting the exact type of osteotomy to be used, two main problems arose: (1) the size, position and shape of the wedge, and (2) a method of internal fixation of both the fracture and the osteotomy which would obviate the use of a plaster hip spica.
